The next item claiming our attention is the variable condenser, and we might say a great deal concerning this part of the apparatus, and then again we might just as well say very little. Experience dictates that this comes out about as follows: in the first place many radio experimenters would rather obtain on the open market a small rotary type variable condenser having the proper capacity for use in this particular wave meter, and this should be .00086 microfarad. Of course any condenser having this capacity within a small fraction one way or the other may be used, but if the student wishes to have a good accurate wave meter, and intends to eventually have it calibrated or checked against a standard wave meter, then he will do well to select a good sturdy and reliable make of rotary condenser. Some of the points to be watched in the design of such a condenser are that it should not have the rotary and fixt plates too closely spaced, or else it will frequently give trouble by short-circuiting; the rotary plates should be accurately locked on the rotary shaft either by having their hubs molded on the shaft or else they should be mounted on a square shaft so as not to turn, or again they can be keyed on the shaft. For the purpose of a wave meter there should also be practically no up and down movement or play in the vertical shaft supporting the rotary plates. For all practical purposes, the capacity of a rotary variable condenser (see Fig. 2), is determined by the usual capacity formula using a K value of 1, which is that for air.

Many radio amateurs and experimenters

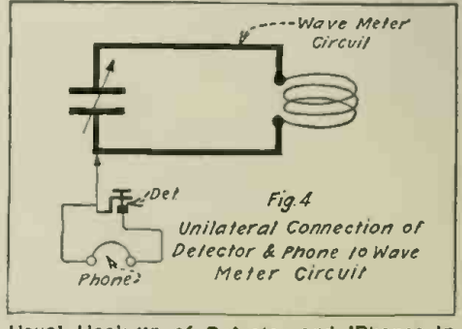

Fig. 4
Unilateral Connection of Detector & Phone to Wave Meter Circuit

Usual Hook-up of Detector and 'Phones In Unilateral Fashion. Where There Is Sufficient Energy to Actuate Detector Properly.

www.americanradiohistory.com

will undoubtedly wish to construct their own variable condenser having this required capacity, and the physical dimensions of such a variable condenser are given in Fig. 2. As will be seen, this particular design comprises three stationary and two rotary aluminum or brass plates. These plates should preferably have a thickness of 1/16 to 3/32 inch so as to be perfectly flat and retain their shape, and thus maintain the accuracy of the condenser when once assembled. The four active air dielectric spaces between the plates should be exactly 1/32 inch. The diameter of the rotary plate, as Fig. 2 indicates, should be 8-23/32 inches, and by cutting the lugs on the stationary plates as well as on the rotary plate in the manner indicated, will permit of the accurate interleaving of the rotary and fixt plates so as to give the proper capacity.

Thus we see that the two principal parts of any wave meter are—an accurately cali-

brated precision variable condenser and an accurately calibrated inductance. In practically all cases this inductance and capacity of known values are connected together in parallel or shunt as shown at Fig. 3-A. Referring to Figs. 3-A and 3-B, the lead wires joining the inductance or exploring coil to the variable condenser are composed of two pieces of No. 16 flexible lamp cord, each 6 inches long. A 3-inch length of copper strip joins the two pairs of binding posts. Fig. 3 shows one set of binding posts being used for the inductance coil and the other set intended for the connection of a hot wire milliampere meter or thermo-couple and galvanometer. Ordinarily this latter pair of binding posts are fitted with a piece of copper strip about 1/16 inch thick forming a *jumper*.

It is well in all cases to fit a safety spark gap across the terminals of the variable condenser as shown at Fig. 3-B, as when the wave meter is used in close proximity

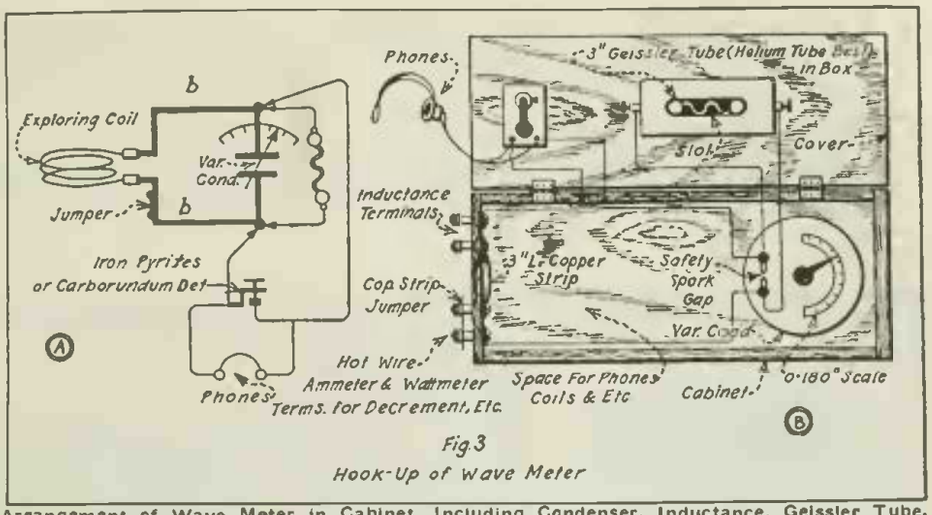

Fig. 3
Hook-Up of Wave Meter

Arrangement of Wave Meter in Cabinet, Including Condenser, Inductance, Geissler Tube, 'Phone (1,000 or 75 ohm), Etc. The Diagram Shows Geissler Tube and Detector and 'Phone Indicator Circuit, Either of Which Can Be Used.

to radio transmitting sets, there is very often a sufficiently heavy current induced in the wave meter circuit to cause a puncture of the insulation of the inductance coil or a short-circuiting of the variable condenser, especially if the latter happens to have closely spaced plates.

For indicating the maximum resonance when measuring the wave length of a transmitting set, where the induced current in the wave meter is of course quite strong in any case, a very good indicator, as proven by practise and experience, is an ordinary 3-inch Geissler tube, or better yet a small *helium* gas tube. It is best when using either a Geissler or helium tube as an indicator of maximum resonance, to place the tube in a small box mounted on the lid of the wave meter, the box being blackened inside and provided with a slot in the front so that the degree of glow in the tube may be easily seen. It is also common practise to connect a hot wire milliampere meter in series with the inductance and condenser of the wave meter by removing the jumper on the series binding post terminals and connecting the meter to this; in this case the maximum resonance, and therefore the wave length at which the circuit under test is oscillating, is indicated by turning the condenser handle until the needle of the hot wire meter reaches a maximum reading. Some operators prefer to use the well-known detector and telephone receiver method of determining the maximum resonance point in the wave meter circuit as the diagrams at Fig. 3 show. The detector and wireless 'phones are connected (in series or in multiple) across the variable condenser for the purpose. This arrangement is extremely sensitive, and is the one invariably used in measuring the wave length of received signals. The Geissler tube or other apparatus is, of course disconnected from the wave meter circuit, if the detector and 'phone method is to be used. With respect to the detector used on the wave meter, it may be said that either carborundum or iron pyrites proves best, as either may be subjected to a very strong current without harm.

Figures 4 and 5 show two more circuits used with the wave meter. Fig. 4 shows a detector and telephone receiver circuit, connected to the main oscillating circuit of the wave meter by a unilateral or one-wire connection. This method is highly recommended in many text books treating on the wave meter and its uses, and at the present time it is used on many of the best commercial wave meters. This connection of the detecting circuit possesses the advantage that it cannot have any detuning or offsetting effect on the oscillating circuit as is the case where it is placed in shunt to the capacity and inductance composing this circuit, and it is very efficient for the purpose in hand, as with this connection the detector and 'phone receive just a sufficient amount of energy to operate

German Radio Apparatus Used at Metz

THE accompanying illustrations show the interesting radio apparatus and antenna mast used at the famous German military base at Metz. These photographs were taken by the French Army when they entered Metz after the signing of the armistice. The photograph of the aërial mast is interesting as it shows a very novel construction whereby a strongly braced tower structure is formed of steel tubes or pipes, provided with flattened ends thru which bolts are past. The base of this radio mast, measuring 80 meters in height, is tapered to a point at the bottom, as the photograph shows, and rests on a large porcelain insulator. Suitable guys and pins were used in arranging this insulating base support, so that the foot of the mast could not slip or break away if for any reason the insulator should break. The mast was well-guyed with steel cables running in different directions, and the antenna was supported in umbrella fashion from the top of the mast. As the photograph discloses, a high steel fence enclosed the grounds connected with the station to preserve secrecy, and also to prevent any one coming in contact with the highly charged aërial conductors.

Three Interesting Views of the German Wireless Station at Metz, Photographed by the French After the Famous Stronghold and Fortress Had Been Surrendered to the Allies Under the Terms of the Armistice. The Left-hand Photo Shows Front Panel View of Elaborate Radio Receiving Cabinet With the Numerous Dial Switches for Close Tuning. The Center View Shows the Side of the Cabinet Removed with the Intricate Wiring and Switch Connections Necessitated by the Close Tuning Conditions at Such an Important War Time Radio Station. Note the Clever Rotary Slider Control of the Inductance Coil at the Top of the Side Lid. View at Right Shows the Base of the Steel Radio Mast, 80 Meters in Height Which Rests on a Gigantic Porcelain Insulator at the Foot of the Structure. The Station Was Placed Many Feet Underground.

The remaining two photographs show respectively front and side views of the receiving apparatus used at Metz. One of the first interesting things we note in connection with the design of the apparatus, and plainly visible in the side view is the rotary control of the inductance slider. This is accomplisht by a lever secured to a rotary knob, the free end of which is joined by means of a link member to the slider of the inductance in the manner shown, so that as the handle is turned in rotary fashion, the slider will move back and forth along the coil. The detectors, of which there are several in duplicate, are observed at the top of the instrument, while an elaborate multiplicity of control handles with graduated inductance pointers, are provided for changing the wave length of the primary and secondary receiving circuits, as well as the coupling between the coils of these circuits, and also the capacity values used.

The telephone receivers, several sets of which may be used when desired, are connected with the receiving set cabinet by means of flexible cords and jacks, eight of which are placed in a group at the lower center of the front panel.

Among other things, we find it interesting to note the very neat arrangement of the interior wiring of the cabinet, the various connections being run symmetrically in straight lines, evenly spaced and held rigidly in place by means of insulating cleats. In the side view of the apparatus, which shows the interior, one may perceive the neatly wound inductance coil at the bottom of the cabinet, and as will be seen, it is square in form with a number of inductances placed along the form on which it is wound. This set is designed so as to be suitable for receiving either spark or arc signals. No vacuum bulb detectors or oscillators are shown, but we know that they were used in many of the German sets, the bulb employed being that devised by Lieben and Riez.

Wireless Terms Illustrated—"Beat Receiver" —Courtesy The Oscillator.

MORE BUNQUE.

By J. A. Weaver.

I often wonder how Noah made the arc light.

And it sure does get my goat why insulators wear petticoats.

And of what possible use is a vacuum cleaner, being as a vacuum is always clean?

And whether undamped waves oscillate or vibrate?

And whether it would be murder to kilowatt?

And whether you can measure water with a wavemeter?

And how a bus-line can run from place to place without moving?

And whether it would be nice to be a miner in the mines of Asia-Minor?

And if a condenser is over charged by a conductor would it cause a disturbance on the trolley line?

And where does the dago when nite approaches?

And how to tell when onion plants armature?

And what is the price of a drink at the bus bar?

And why some boobs persist in saying a.c. current and d.c. current instead of a.c. and d.c.?

And whether there are any seeds in a transformer core.

CHAIN OF RADIO STATIONS.

The establishment of a chain of radio stations, approximately 30 miles apart along the Atlantic Coast, was announced at the headquarters of the 1st Naval District recently. The statement intimated that by this arrangement incoming vessels, when 150 or 200 miles off coast, could determine their position easily by communicating with shore stations, regardless of weather conditions. Along the 250 miles of coast included within the 1st District eight stations are already in operation.

COAST GUARD STATIONS TO HAVE WIRELESS.

In the near future radio stations will be installed at the coast guard stations at the Isles of Shoals, at Station No. 2 at Cross Island, Buck's Harbor, Me., and Station No. 8 at Damiscove Island, Boothbay Harbor, Me. A number of radio operators will be sent to these stations.

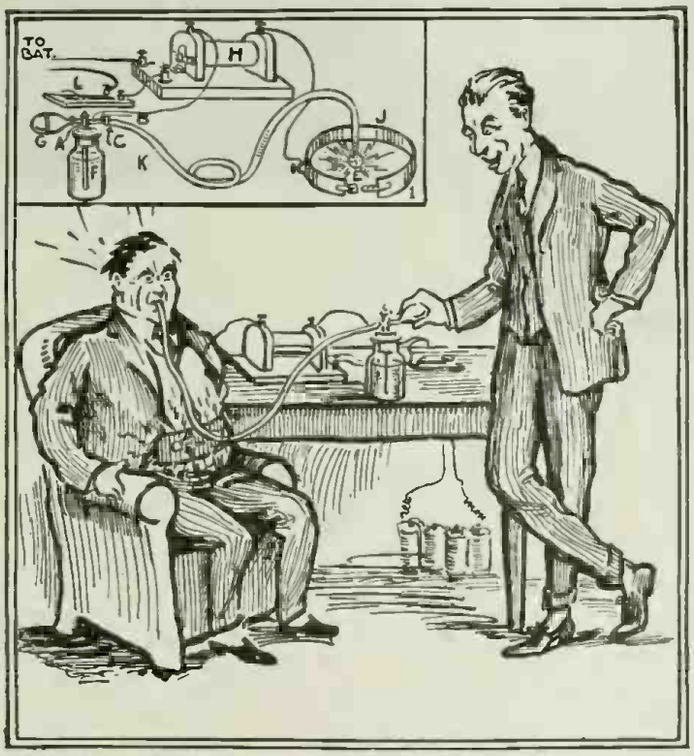
A Timely Reinforcement

A Copper Plated Stomach

By THOMAS REED



THERE'S a lot in being forehanded. Mother was that way. Every Saturday we used to have salt fish for dinner, so she wouldn't be bothered with getting up anything to eat on baking-day. That sounds like a paradox, but it wasn't, it was a shame, for the "baking" was very appetizing and savory, while the fish was—well, not so savory.

Now, when you wanted salt fish on Saturday, you had to begin way back in the week somewhere. Tuesday was a good day because there wasn't much of anything to do (on top of the regular chores) except the ironing, and you had a chance to think. Follow me carefully—you know how long it is from Tuesday before Saturday comes around? Well, mother used to plan ahead all the time, foreseeing she was going to be heated and tired, and all fust up with cooking formulas, and would need an accommodating viand for dinner that she could slap down most anywhere without hurting it, and tell us children to go to it and forget the whole business. On Tuesday she commenced *deodorizing* the fish.

You see, while the fish abode with the grocer, it was always picking up scents like coffee and spices and matches and kerosene, from the clerk's habit of wiping his hands on it in passing, and the hostler would chuck a horse-blanket on it often enough to give it a quaint stable tang. But what you'd call the basic flavor was imparted by "Tabby"—the store cat. The pile of codfish was the place where the cat slept and took her bath (the kind of dry-cleansing a cat calls a bath); also her refuge from stray dogs—or ambush, according to whether she could lick the dog or not. The result was you couldn't say the cat smelt fishy, or the fish catty, but they smelt about alike! It was a blend, like this fancy-named toilet-water you have to have pronounced for you, *eau de* something or other.

If you just wanted the fish for a smelling fish, you didn't have to do anything to it, it was all right as it was. But when you wanted to use it for an eating fish, you had to go to work and separate the fish part from the odor part, or as much of it as you could. It wasn't difficult or laborious at all, but it took time, and that's why you had to be forehanded. You put this fish into a good stout pan—a pan that wasn't particular whom it associated with—and covered it with common ordinary water. The water didn't stay that way very long. In a few hours it was most *un*common water, yelling to heaven and casting into the air bunches of assorted perfumes, like Spring-time tripping o'er the lea and scattering flowers—I mean the operation was the same, not the raw material.

When one dose of water had suffered about enough you poured it off and renewed it, and so on. If you tended right to your business thru Tuesday and Wednesday and Thursday and Friday and Saturday morning, then by Saturday noon there was your fish—transformed into a regular eating fish—at least those who had to eat it could. That's how you had to plan meals in those days—no frittering away your time at *tea-dongsongs* till the last minute, and tossing on a preserved pig's foot for supper.

To Copper Plate Human Stomachs So as To Digest the Present Post-War Foods, Thomas Reed Here Shows Us How To Set About Rigging Up the Necessary Apparatus. When You Once Receive This Treatment You Will Be Able to Swallow Nails, Old Milk Cans, Sections of Steam Boilers, Bricks, et Cetera, and Then the Undertaker Will Nail You Up.

Examples like this gave me the same habit of being forehanded. I'm always looking ahead and spying out some situation that's liable to be dangerous or disagreeable, and providing against it. It's a lucky thing I am, as it happens, and you'll say so, too, when I tell you.

Perhaps you remember we had a "war", or something like that, recently. Well, just when we were thinking it was going to last forever, we began to hear noises from the Other Side that sounded like "By gorry we've got 'em licked!" "They're quitting!" "The war is over!" "Honk-honk!" "Wow!" and other expressions of quiet satisfaction. From that moment nothing was thought of but comebacks to hand to Germany in return for her favors of the past 40 years, with the accent on the last 4—which was righto, and success to the job; but in the rush of business, a very important point was overlooked by everybody but ME. I'll tell you what I mean.

You know how thick and fast the celebrations came, along there in November? They made a record for thickness and fastness that won't be beaten till "Bill" gets back from Hell. There was the "Fake Peace Celebration" on Thursday, and the "Real One" on Monday, and the "Regular One" on Tuesday. I don't know how it was with you, but by Wednesday I had food for thought—and it was the only kind of food I was able to sit up and take any notice of.

The thought, being fed, was mainly to the effect, how nice it would have been if I'd had one of those *copper-lined stomachs* that are always being talked about and never realized. I don't know as I ever appreciated before how reliable copper is. Viewing the ruin of my faithful Gastric Cavity thru handling the few easy objects I'd sent down to it, I envied the old copper boiler at home—how it used to digest 3 or 4 bushels of the family wash, or boil up a barrel of soft soap, or a tub or two of whitewash-stunts really exacting, you know—and get away with it year after year.

Ah me, as the fellow says. With a tummy built on the lines of that boiler, one could celebrate Peace till the cows came home with their 16-cent milk, and then tackle a New Year's Eve and a couple of "wakes" on the side, instead of rueing the day—whatever that is—as I was doing.

But the real horror of the situation was this; here were a million or two of soldiers and sailors due to come home and go thru this celebration-thing multiplied to the hundredth-power. The big cities were going to stuff 'em, then the smaller branch cities, and the railroad towns, and the home towns—the strain all the time increasin as the burg grew smaller—till finally they'd fetch up at "Home" itself, the one with the Big "H", with Mother roasting chickens and frying flapjacks and baking pies in a wild effort to make up a year's deficiencies in army rations all at one meal. All that, and only an ordinary membranous stomach to stand it! Was there any time to lose? No. The copper stomach, so long postponed, had to be invented *tout de suite* if it was going to be ready for the occasion.

Well, here it is, all ready and waiting,

(*Continued on page* 927)

www.americanradiohistory.com

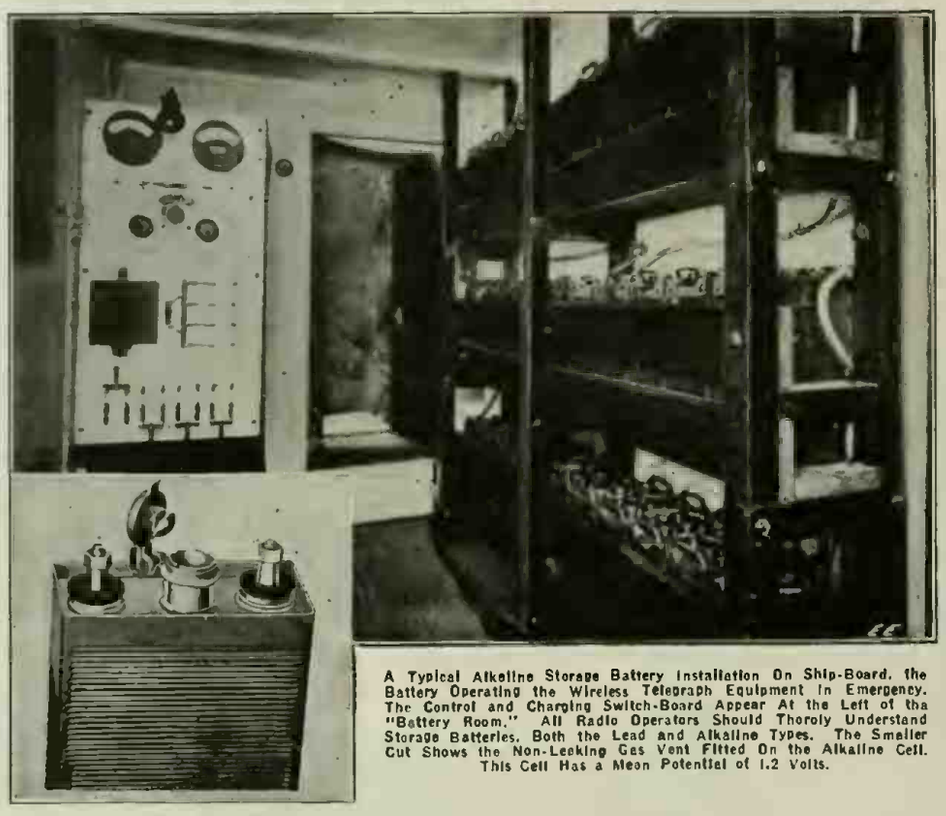
The Alkaline Storage Battery

By J. F. SPRINGER

STORAGE batteries are of two principal kinds—(1) the lead-acid battery, and (2) the alkaline battery. Our attention is now directed upon the latter. There is but one alkaline cell of prominence on the market—the Edison battery. Each cell is a complete self-contained unit and may be used alone or in conjunction with other cells. A typical cell will have a voltage of about 1.2 average discharge potential; the maximum discharge potential is about 1.45 volts at the start. The charge and discharge voltage characteristics are given in the accompanying graph, Fig. 1. While charging the cell voltage may rise as high as 1.85 volts. The amperage will vary with the size of the cell. By connecting a battery of cells *in series*, it is possible to run the voltage up to any desired point; see Fig. 2-A. A usual voltage for rather short circuits—under 300 feet—is 30-32 volts. Accordingly, about 30 cells are required. The battery used as a unit will have a voltage equal to the sum of the voltages of the individual cells. The amperage will remain the same as with the single cell. It is necessary, therefore, to choose a size of cell that will give the amperage required for the service or else use more than one battery, connecting the batteries—not the cells—*in parallel*, see Fig. 2-B. For a 110-volt system, a large number of cells will be needed. In making such calculations, it will be best to rate the alkaline cell at just about 1 volt. Thus, for 110-volt service use 110 cells, connected in series.

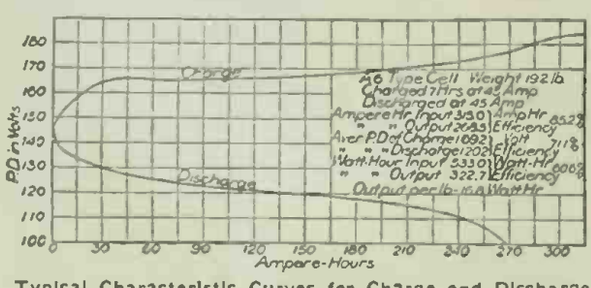
In purchasing a battery, it will be necessary to decide on the voltage to be used. There are probably more household and similar devices on the market that are designed for the 110-volt system than for any other. At the same time, there is a considerable range of such devices which are adapted to, and available for use on 30-32 volt circuits.

The alkaline cell has a tight-fitting cover. As in all batteries there will be generated a certain amount of gas; this escapes thru a special valve. The cell is well suited to rough usage, partly because of the tight cover and partly because the container is of sheet steel and not of glass or hard rubber. The liquid is of an alkaline character. It loses but little of its water as time goes on. In order to determine whether the strength is normal, a hydrometer may be used. The electrolyte consists of potassium hydrate (21 per cent solution) to which has been added a small amount of lithium hydrate. The specific gravity of the alkaline cell does not change during charge or discharge. The normal specific gravity will be 1.210, but this may drop at times to as low as 1.160 without affecting the cell. A brand new alkaline battery will not develop its full capacity at once. After a number of chargings it will settle down to a standard performance. This settlement into a standard condition is understood to be due to the improvement in the conditions of the negative plate consequent upon regular charging and recharging. This process of self-forming continues over a period of from one to three months.



The care of an alkaline battery will ordinarily be simple. The density of the liquid may be watched and corrected, if necessary. This will usually mean the addition of a little water to bring the hydrometer reading down to 1.210. Regularity of handling will probably give better results in an alkaline battery than any other one thing. This is especially true in connection with the charging.

A battery may be charged slowly or rapidly or at a medium rate. That is, it may be done *normally* in 7 hours, or rapidly in 1 or 2 hours, or at a moderate rate in 4 or 5 hours. Slow, regular charging at the normal rate is to be preferred, if conditions make slowness conveniently possible. Whether the battery is charged slowly or rapidly, evenness of charging is always to be adopted.



Direct current only is usable in charging. If alternating current is the only source of energy available it will be necessary to convert it into direct current and to use the latter with the battery. There are several methods which may be employed. First, there is the motor-generator. The alternating current is used to operate a motor. The motor drives the generator and produces the direct current for charging. A mercury arc rectifier is another device for converting the alternating current into direct. This device is often more economical and convenient if only a small current is to be handled.

Of course, direct current may be generated at once. The equipment necessary will be (1) an engine or some equivalent means of operating the generator; (2) a generator, and (3) a switchboard. It would probably be cheaper to use the current direct from the generator to operate the lights, etc., and to dispense with the storage battery, if the current were required in a steady, even stream. But current is not ordinarily required thus in a home or on board a boat.

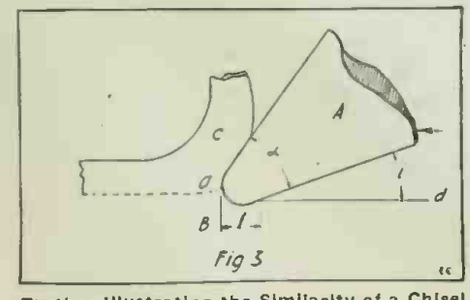
Experimental Mechanics

BY SAMUEL D. COHEN

LESSON XI

THE THEORY OF TWIST DRILLS.



THE student who has been following the past lessons in "Experimental Mechanics" may now find himself confronted by a more or less difficult task in properly utilizing a very important tool, namely—*twist drills*, and

In the Present Article the Author Discusses the Theory of Twist Drills, the Shape of the Grooves, the Pitch of the Cutting Edges, Et Cetera. The Lips C-C May Be Considered as the Cutting Edges of Two Chisels, Which Turn about the Axis of the Drill.

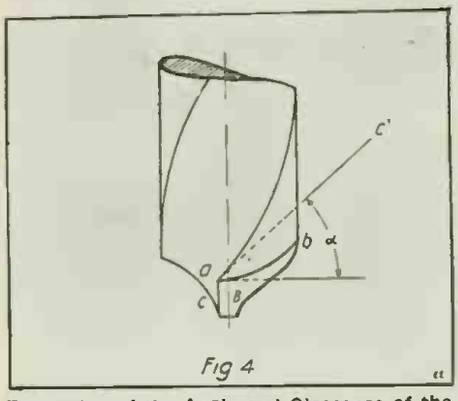
the writer gives below a brief resumé of the subject of twist drills and their grinding. Because it is very essential to follow understandinly the subject of twist drills, a short mathematical treatise of simple nature will be given in order to more readily facilitate the understanding of the subject.

The twist drills stand in use so far above flat drills that they are now an indispensable tool in every workshop for metal working. They may be manufactured by milling or forging two spiral grooves out of a cylindrical bar, or by twisting a bar of the desired cross-section, so that the lines originally running parallel to the axis become spiral lines. The first method of manufacturing is today still the most common one. When we take a spiral drill and turn it with the top towards us, we shall see it as shown in Fig. 1. *dd* are the spiral grooves, *cc* both cutting edges, so the drill will have to turn in the direction of the arrow. *ee* is the solid part of drill; the top of the drill nearest to us is the edge c^1, which unites the two edges *cc*, making an angle of about 55 degrees with each of them. The cylindrical surface of the drill at *ss*, only exists for the part *aa*, for, to prevent unnecessary friction against the walls of the hole, the rest of the surface is brought to a somewhat smaller diameter. Sometimes the surface *s*, is gradually backed off, beginning at the edge without a distinctly perceptible step, as in Fig. 1. The profile of the grooves *dd*, is chosen so that the intersection with the top plane *b*, gives as far as possible a right angle line *C*. The shape of the line *b* is of lesser importance provided that the groove *d* is wide enough to allow the chips to pass easily. The dimension of the weakest point of the drill where the edge c^1 is found, is fixt by the demand of strength in the drill. The edge c^1, which cuts very badly, should he as short as possible. Ordinarily, it is taken 1-10th of the diameter at the point of the drill and gradually increases to the upper end, for reasons of strength.

Further Illustrating the Similarity of a Chisel Cutting Into a Piece of Metal to the Two Cutting Edges of a Twist Drill.

When looking at the drill sideways we now see it as shown in Fig. 2; *cc* are the sectants which form together an angle of about 120 degrees, c^1 the connection, *dd* the grooves, the pitch of which amounts to 5 to 8 times the diameter of the drill. We consider *cc* as being the cutting edges of two chisels, which, turning around the axis must cut chips from the metal. The form and the position of these chisels in regard to the metal will have to answer the same requirements as every other cutting chisel, which are these: In Fig. 3 *A* represents a cross-section of the chisel, *B* the piece of work from which the chip *C* is cut by moving *A* in the direction of the arrow.

To prevent the chisel breaking its cutting edge—the angle α—obtained by grinding, and therefore called the *grinding angle*, must be sufficiently strong. For cutting mild steel and iron α is made upon an average of about 55 degrees; with very good steel the angle can be some degrees smaller; with a poorer grade steel it must be some degrees larger. The loosening of the chip from the metal is not done at the lowest point of the chisel, but at *a*, being the point most advanced. The metal is pushed down at a length *l*, Fig. 3, and thereafter returns to its level *a-d*. The smaller the angle *i*, which may be enlarged or diminished by the position of the chisel, the longer *l* will be, and the greater will be the resistance of the metal being pushed down. Experience tells us how large the angle *i* must be; it varies between 4 degrees to 8 degrees for lathe and planer tools. We shall see how great it must be made for twist drills. In no case may it be smaller than 4 degrees, or the chisel will refuse to cut.



Don't Miss the Next Lesson—"Grinding Twist Drills."

It will discuss the various factors involved in properly grinding twist drills, both by hand and machine or jig. A real practical article which every amateur machinist will want to read.

Referring to Fig. 4, the point *a*, of the cutting edge *c*, situated on the cylindrical surface of the chisel, we find the grinding angle *a*, appointed by the tangent to the spiral and by the tangent to the line *ab*, sectant of the cylindrical surface of the drill, and the ground top *B*. So the size of this angle is determined with regard to the strength of the edge and practically amounts to about 55 degrees. Then follows the angle *i* in Fig. 3; where to find it. While turning around on its axis the drill advances into the metal. So each point describes a spiral line with the pitch equal to the feed of the drill for one revolution. These spiral lines, however, are of unequal diameter. Point *a*, in Fig. 4, on the circumference of the drill is given in Fig. 5, as if moving on the spiral line a^1a. The diameter of the drill being $D = 1$ in. and the feed 1-50th in.; the inclination of the spiral line is found by:

$$\text{Tan } \beta = \frac{\text{feed}}{\text{circumference}} = \frac{1}{50 \times \pi} = 0.00637$$

$$\beta = 0° 22'$$

Discussion of the Angle and Clearance of the Cutting Edge of a Twist Drill.

Point *a*, in Fig. 4, at a distance of 1-20th in. from the drill axis, describes the spiral line c^1c with the same pitch *h*, Fig. 5, as a^1a; the angle of inclination γ however, is quite a different one; for the case of 1-20th in. it is:

$$\text{Tan } \gamma = \frac{1}{50 \times \pi \times 1/10} = 0.0637$$

$$\gamma = 3° 39'$$

In Fig. 5 the value *h* of the feed has been given immoderately large for the sake of clearness, and the angle γ has consequently been drawn much larger than it is in reality.

The spiral lines, a^1a and c^1c, are the lines in regard to which the angle *i*, in Fig. 3, has to be measured. They agree with the line *a-d*, in that figure. From this it follows that for point *a* of the drill the setting angle *i* is measured in regard to the line, inclining already 0° 22', and therefore must be so much greater than usually. For point *c* this difference becomes 3° 39'. The setting angle becomes a changeable value, increasing towards the center of the drill. In giving it everywhere the same value for simplicity's sake, that is to say the largest cutting cross-section desired in the center, the edge would become too weak at the circumference.

With the above facts in mind the writer will give a complete practical discourse on how to handle twist drills, grinding, *et cetera*, in the next installment.

(To be continued)

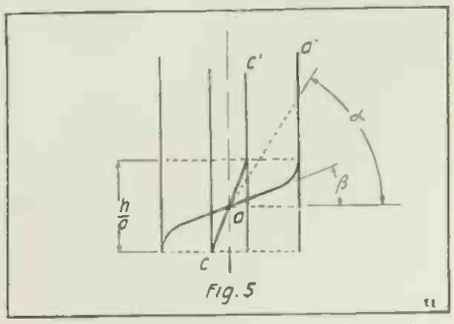


Diagram Used in Explaining the Value of the Angles of Grinding of Twist Drills.

Practical Chemical Experiments

Butter and Butter Substitutes

By ALBERT W. WILSDON

BUTTER is obtained by skimming the milk and putting it thru the process of churning, the globules coalesce and the solid fat separates more or less thoroly from the other constituents of the milk. As found on the market, butter is rarely found to contain more than 80 to 85 per cent fat; the rest

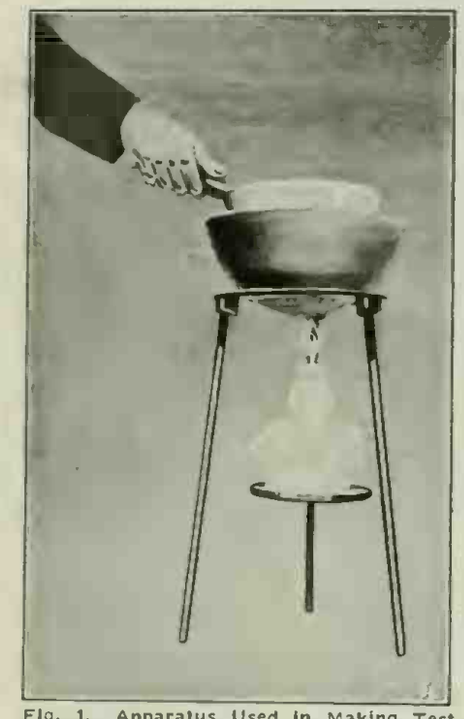

Fig. 1. Apparatus Used in Making Test for Butter and Oleomargarin or Renovated Butter.

being principally water, with some proteids and lactose from buttermilk still remaining in it, and more or less salt or saltpeter, to flavor and preserve it. It quite frequently is colored with some harmless vegetable compound.

Oleomargarin is usually prepared from the fat contained in the intestinal folds of beef cattle. It is carefully stript from the fresh carcass, washed, chilled and hashed exceedingly fine. It is then *rendered* in water-jacketed kettles at a temperature of about 50 deg. C. The scum which separates out at the top is drawn off and the scraps settle at the bottom. The liquid fat is then run into vats and there permitted to stand for a day or two at about 27 deg. C., at which temperature butter is just liquid. The semi-liquid mass is then wrapt up in cloths and prest to remove the thin yellow liquid oil (oleo oil) from the solid fat (oleo-stearin). To turn this liquid oil (oleo oil) into a very good substitute for butter it is churned with some milk so that it can absorb some of the butter taste, then some coloring matter is added (vegetable compound), and the mass is finally run into ice-water, thus chilling it rapidly. It can then be salted and packed like ordinary butter. Two marked advantages which this material has over butter are: (1) It is much cheaper, and (2) owing to the absence of buttermilk and butter fats it has much better keeping qualities. Its flavor ranks well with second-class butter.

"*Renovated*" or "*Process*" butter is in general prepared as follows: Old, rancid, and unsalable butter is melted in a large vat surrounded by a hot water jacket at a temperature of about 45 deg. C. The curd and brine are then drawn off at the bottom, the scum being taken off at the top. Air is blown thru the mass, to remove the disagreeable odor, and after mixing with some milk, the mass is churned and then run into ice cold water to make it granular in structure. It is then ripened, worked to free it from buttermilk and salted. It is required by law in some states that this product be marked "Renovated Butter."

SIMPLE TEST FOR BUTTER

Experiment No. 1. See Fig. 1.

Heat about 3 grams of the sample in a large iron spoon over a low Bunsen flame, stirring constantly. Genuine butter *will boil quietly*, with the production of considerable froth or foam, which may, on removal

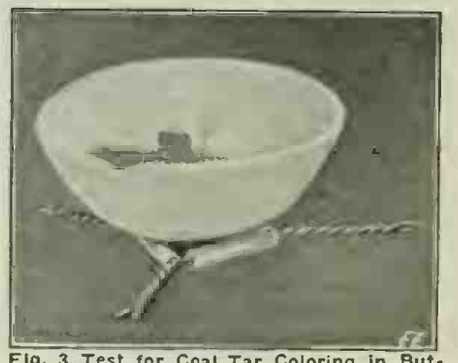

Fig. 3. Test for Coal Tar Coloring in Butter Which Can Be Made by Anyone in a Few Minutes' Time.

from the flame, boil up over the side of the spoon. *Renovated butter* or *oleomargarin* will sputter and act like hot fat containing water, but will not foam. Examine also the curdy particles when the sample is removed from the flame; in the case of genuine butter these particles are *small* and *finely divided*, but in the case of oleomargarin the curd *will gather in large masses.*

MILK TEST FOR BUTTER

Experiment No. 2. See Fig. 2.

To make a "milk test" for butter, place

Fig. 2. Set-up of Simple Apparatus Utilized in Making the "Milk Test" for Butter.

about 60 cc. of sweet milk in a wide-mouthed bottle, which is set in a vessel of boiling water. When the milk is thoroly heated, a spoonful of the butter is added and the mixture stirred until the fat has melted. The bottle is then placed in a dish of ice-water, and the stirring continued until the fat solidifies. If the sample is butter, either fresh or renovated, it will be solidified in a granular condition and distributed thru the milk in *small particles*. If, on the other hand, the sample consists of oleomargarin, it solidifies practically in *one piece*, so that it may be lifted by the stirrer from the milk.

By the two tests just described, the first of which distinguishes fresh butter from process butter or renovated butter and oleomargarin; and the second of which distinguishes oleomargarin from either fresh butter or renovated butter, the nature of the sample examined may be determined.

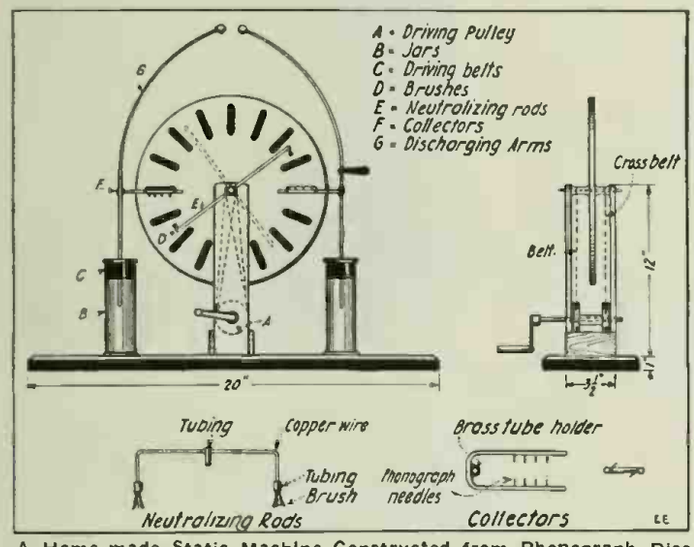
Every house-wife should know how to test butter and oleomargarin and the important differences between them. That is one object of the present paper. The author trusts it proves of value.

BEGINNING with this issue, "EXPERIMENTAL CHEMISTRY", as will be noted, has been changed to "PRACTICAL CHEMICAL EXPERIMENTS." For several years past, Mr. Albert W. Wilsdon, who will continue the new department, has become familiar to our readers thru his chemistry articles. There has, however, been an urgent demand from our readers for articles on everyday chemistry, practical experiments, etc. We are, therefore, beginning with this issue a series of practical chemistry, free from technicalities. We think the change will be welcomed by our friends.

In the same department we are also inaugurating a Question and Answer Department, and every reader is invited to ask any question on chemical phases which may occur to him. Such questions will be answered every month hereafter in these columns. When sending questions, they should be addrest to "Editor, Chemistry Department."—Editor.

(*Continued on page* 894)

www.americanradiohistory.com



This department will award the following monthly prizes: First Prize, $3.00; Second Prize, $2.00; Third Prize, $1.00.
The purpose of this department is to stimulate experimenters towards accomplishing new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best idea submitted a prize of $3.00 is awarded; for the second best idea a $2.00 prize, and for the third best prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings. Use only one side of sheet. Make sketches on separate sheets.

FIRST PRIZE, $3.00

A SIMPLE WHIMSHURST INFLUENCE MACHINE.

By Melville Fisk.

THE static machine described herein is made of simple materials, is easy to construct and the work does not require the use of special tools. A similar machine built by the writer produces a violent and steady spark discharge about an inch or more in length, without the use of Leyden jars.

A Home-made Static Machine Constructed from Phonograph Disc Records.

The plates are two twelve-inch phonograph records of the disk type. Select two which have one side blank. The tinfoil sectors are cemented to the smooth side. It is not necessary to varnish the plates. The bosses that keep the plates parallel on the shaft are small cotton spools, that have a hole in them the size of the one in the record. Fit the spools up with brass tube bearing and fasten to the plates with glue. A thin cloth or paper washer inserted between the boss and plate will help the glue to hold. Rubber tire cement will hold better if at hand. The shaft on which the plates revolve extends out ¾ of an inch on either side of the wooden standards; it is held stationary by a cotter pin inserted in a hole bored down thru the top of the standard. Glue a cardboard washer 1½ inches in diameter to the inside of one of the plates. The base and standard are made of wood in the manner illustrated.

Make the double driving pulley from a large spool such as wire is sold on. Fasten it to the shaft by drilling thru the shank and shaft and inserting a cotter pin or screw. Be sure and make the grooves in the pulleys deep enough to hold the belts securely. Rubber bands tied together make very good driving belts. Tie them with strong linen thread and leave a half inch of slack between each band. As the plates are to revolve in opposite directions, cross one belt.

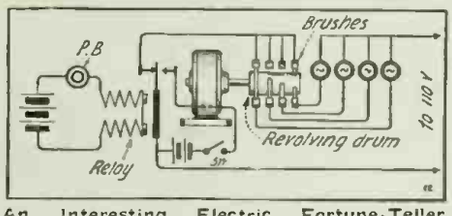
The neutralizing rods are made from ⅛ inch copper wire bent to shape. They are pivoted on the protruding ends of the shaft by a short piece of tubing soldered to the center. Press the tubing slightly together at the open end to make it grip firmly. The brushes are made from very fine copper strands secured from wire such as is used in receiver cords (gilt tinsel). Cut about twelve strands two inches long; tie a knot in the center, and fold over so that all ends are together. The brushes are then slipt into the small tubes soldered onto the ends of the rods and are fastened by squeezing the end of the tube together.

Make the collectors as per sketch, using heavy copper wire. The points are long phonograph needles, fastened to the arms by drilling and then soldering. The needles should be slanted slightly in the direction in which the plate rotates. The supports are brass tubing, soldered on.

The discharging arms are of brass rod of a size that will fit in the collector supporting tubes. Make a small dent in each tube so that the rods do not slip all of the way thru. Fit balls to the ends of the rods by boring, then pegging and soldering.

The jars are used as supports only. Varnish them inside and out and fit with stoppers, bored to hold the collector tubes. A simple stopper is made by cutting a large wire spool in half and then winding paper around the shank to make a fit with the jar. Before using soak the stopper in melted paraffin. Further insulation can be obtained by placing pieces of a broken record under the jars. Glue the jars to the base.

In operation the neutralizing rods should be at right angles to each other, the best angle, however, can easily be found by trial. The brushes should touch the plates lightly—no pressure is necessary. The collector points should be about ¼ inch away from plates. Be sure that they are all the same distance away or else some will not contribute to the collecting. The distance between the plates should be about ⅛ to ¼ inch.



SECOND PRIZE $2.00

BLINKING LIGHTS TELL YOUR FORTUNE.

A glance at the illustration will show that while the magnet side of the relay is open, the small battery motor is running, revolving the drum. A gear may be used if a slower speed is necessary. When the push button is prest, the armature of the relay is attracted, breaking the motor circuit and making connection on the other side of the relay which goes to the one set of brushes on one side of the drum. The armature is itself connected to one side of the battery for the motor, and to one side of the current supply for the lamps. On the other side of the drum are the brushes connecting to the different rings on the drum. These brushes also connect with the various lamps which are again connected to the other side of the current supply for the lamps. As the button is prest, the motor stops and the circuit thru one of the lamps is made, the particular lamp depending upon the position of the drum when the motor stopt. In front of each lamp is a pane of glass on the back of which is pasted the fortune telling matter. The front of the glass may be painted with a thin white paint.

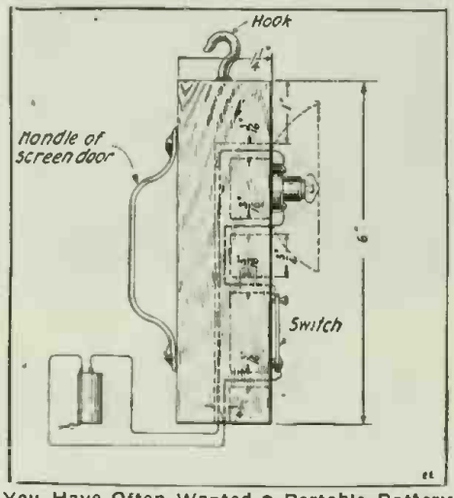
WILLIAM F. HAASE, JR.



An Interesting Electric Fortune-Teller, Which Will Provide Hours of Amusement.

THIRD PRIZE, $1.00

PORTABLE BATTERY HAND LAMP FOR THE HOME.

The articles for the construction of this lamp can be purchased at a small sum, if you haven't them at home. Flexible lamp wire is the best for the wiring of this light.

You Have Often Wanted a Portable Battery Hand Lamp—Here's How to Make One at Practically No Cost.

About ten feet of wire is needed, when a large dry cell is used which cannot be carried around. For a pocket (flashlight) battery only a few feet is necessary. By means of the hook the lamp can be hung anywhere or in any corner on a nail, etc. A 1½ volt tungsten lamp is right for a single dry cell. A reflector adds greatly to the efficiency of the light.

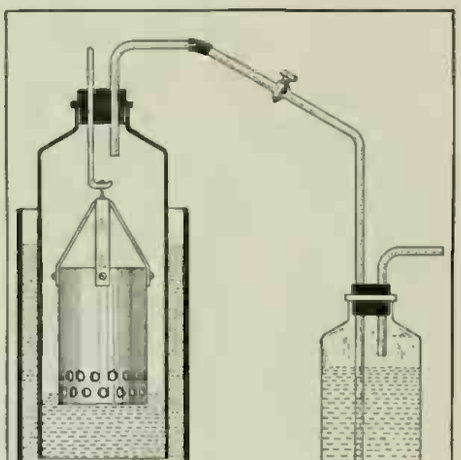
www.americanradiohistory.com

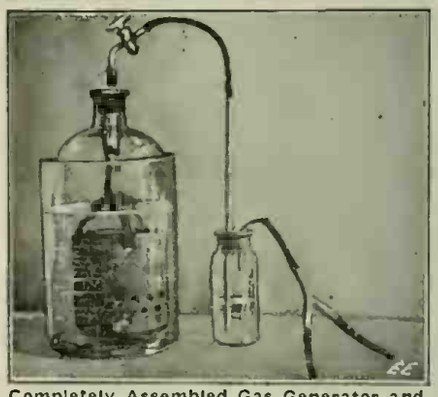
A Simply Constructed Gas Generator

By IVAN CRAWFORD

AMONG the automatic gas generators on the market there are few within reach of the average experimenter. To meet this condition, Prof. C. D. Dilts has recently developed a generator which may be easily and cheaply constructed. In experimenting with qualitative analysis a constant supply of hydrogen sulfide is essential. This generator, being self-regulating, will furnish a constant flow of hydrogen sulfide, carbon dioxid, or hydrogen. The principle of operation is the same as that of the well-known Kipp generator, namely that when the gas formed is not allowed to escape the solid material is automatically raised out of the liquid, but when the pressure is relieved the solid substance is lowered into the liquid, and the generator begins to function. As will be seen in the drawing, the four parts are: first, a glass jar or container; second, a bottle of slightly smaller diameter, with the bottom removed, and fitted with a stopcock in the top; third, a lead basket for holding the solid material; and fourth, a small wash bottle.



This Illustration Shows the Different Parts Composing the "Gas Generator" Here Described.



The glass jar may be easily made by cutting off the top of a large bottle. There are many methods which may be employed in removing the bell of the bottle, but by far the best and surest is the one described below.

Several long strips of newspaper, about an inch wide, should be soaked in water and wound about the bottle in two bands at the place where it is desired to break the bottle. About a quarter of an inch should be left between the two bands. The bottle should then be slowly revolved with the hands, allowing a blow-pipe flame to play upon the exposed part between the bands. When this portion is heated sufficiently the application of a drop of water will cause the glass to be evenly broken. The edges should then be smoothed on a soft grindstone. The bottom of the smaller bottle is removed in the same manner.

The sheet lead for the basket may be procured at any plumbing shop. It may be easily bent to the required shape, leaving small holes in the bottom to allow the acid to enter. The basket is suspended by means of a closed piece of glass tubing, bent to form a hook, which runs thru the two-hole stopper. The delivery tube from the bottle may be fitted either with a glass stop-cock or with rubber tubing and metal pinch-cock. Altho not absolutely necessary, a wash bottle is a desirable addition to the generator, as it not only steadies the flow but cleans and purifies the gas.

Sectional View of Gas Generator.

Completely Assembled Gas Generator and Wash Bottle.

The apparatus should now be assembled as is illustrated in the drawing and photograph. The solid material, such as iron sulfid (when H_2S is desired) is placed in the lead basket and the dilute acid in the glass jar. When the smaller bottle is placed in the jar the acid, reacting with the iron sulfid, engenders a flow of H_2S which forces the acid out of the basket if the stop-cock is closed. When the stop-cock is opened, the gas escapes and allows the acid to touch the iron sulfid, again causing the formation of H_2S. Thus gas is always easily procurable without waste of material.

TESTED CHEMICAL LABORATORY STUNTS.

1. *Spoons That Will Melt in Hot Water.*—Fuse together in a crucible 8 parts of bismuth, 5 of lead, and 3 of tin. These metals will combine and form an alloy, of which spoons can be easily made which possess the remarkable property of melting in hot water, coffee or tea.

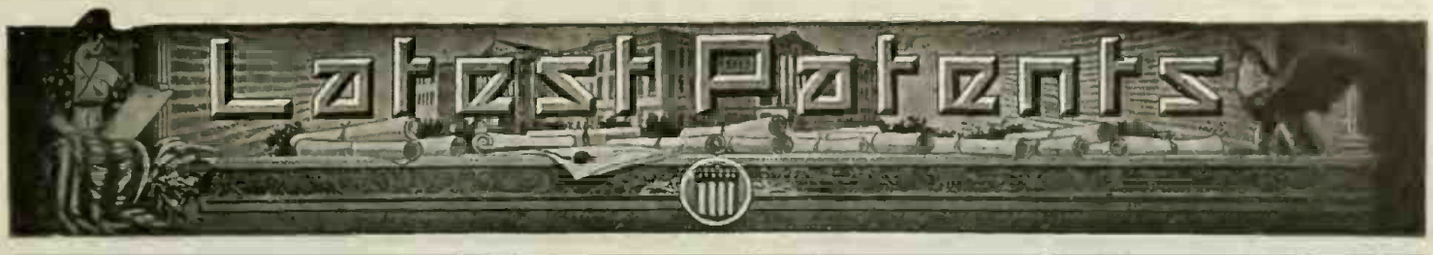
2. *A Self-dancing Egg.*—Take a thin glass tube about 3 inches long and fill it with mercury then seal both ends with good hard wax. Next have an egg boiled and then break a small piece of the shell from the smaller end and thrust the tube with the mercury in, lay it on a table and it will not cease tumbling until the egg is cool. The same can be done by taking a small bladder putting a little mercury inside and blowing it up, then warm the bladder, it will skip about as long as the heat remains.

3. *To Give a Piece of Charcoal a Coat of Silver.*—Lay a crystal of silver nitrat upon a piece of burning charcoal; the metallic salt will catch fire and will emit sparks of various colors. The silver is reduced, and, in the end, produces upon the charcoal a very brilliant and beautiful appearance.

4. *In Water But Not Wet.*—Powder the surface of a large or small vessel of water with some lycopodium, which may be obtained at any drug store; you may then challenge any one to drop a coin into the water, and that you will get it without wetting your hand. The lycopodium adheres to the hand and prevents its contact with the water.

5. *Artificial petrifactions* (turning into stone).—In a retort place a small quantity of pounded fluor-spar and sand, and pour upon it some sulfuric acid; fluosilicic acid gas will be disengaged, holding silex in solution. The subjects you wish to petrify must be moistened with water and placed in a vessel connected with the neck of the retort, the silex will be precipitated upon them like a frost and will have a beautiful appearance. It will wear for years. Note—Do not breathe in this gas.

6. *An Experiment With Sugar.*—Take about 5 or 6 pieces of lump sugar and place them in a cup; next pour about 3 tea spoons full of boiling water upon them, and then add some sulfuric acid. It is truly a wonderful spectacle, and more instructive than reading, to see the sugar turn black, then boil, and now, rising out of the cup in a black color. It is now charcoal.



7. *To Melt Steel.*—Heat a piece of steel to redness in a fire, then hold it with a pair of pincers. In the other hand take a stick of brimstone or roll sulfur and touch the piece of steel with it. Immediately after their contact the steel will melt and drop like melted butter.

8. *Explosion Without Heat.*—Take a crystal or two of nitrat of copper and bruise them; then moisten them with water and roll them up in a piece of tin-foil, and in a minute the foil will begin to smoke and soon after will take fire and explode. Unless the crystals of copper are moistened, no heat will be produced.

9. *To Melt Lead in Paper.*—Wrap up a very smooth piece of lead in a piece of paper, then hold it over the flame of a taper; the lead will be melted without burning the paper providing there are no wrinkles in the paper and that it is in contact with the lead everywhere.

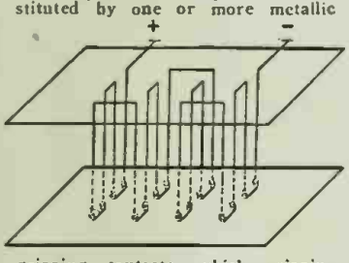
Electric Engraving Apparatus

(1,289,000; issued to Andrew M. Robinson)

An electric engraving apparatus employing a source of electric current forming an arc to produce the engraving. It consists of an ap-



paratus employed with graduating tools, etc., for marking metal parts of machines, etc. A further object in the invention provides an auxiliary electric current or circuit connected to the pencil, and means in the pencil for controlling the make and break of the auxiliary circuit, to open and close the main circuit so as to prevent arcing when it is raised from the work. This apparatus eliminates this objectionable feature. The case contains a transformer, also a number of switches, by which the character of the current may be varied at will.

Current Modulator

(1,288,117; issued to Francesco Morano)

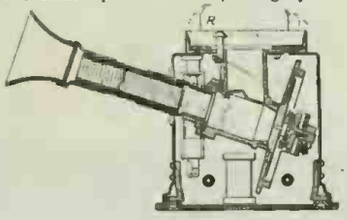
The chief object of this invention is a metallic microphone for high currents, which microphone is constituted by one or more metallic

gripping contacts, which gripping contact is formed of two contact elements, so arranged that one of them grips the other. The vibrating element is firmly mounted by the diafram, while the other element is supported by such means that the pressure of the contact which is formed by both elements accurately affects it. In consequence, the electrical resistance of the contact itself may be capable of varying in rigid conformity with the vibrations of the diafram according to the amplitude of said vibrations.

Apparatus for Locating Sunken Bodies

(1,287,907; issued to Patrick B. Delany)

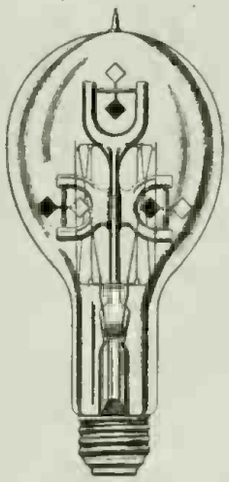
Sunken ships and bodies, by the use of this invention, may be found very readily. It is an electrically operated device, used with some form of communicating device, such as a telephone receiver, and acts upon the principle of the circuit



being closed, and having normally a certain definite resistance, i.e., the inventor does not use coils conductively or otherwise for the detection. The bare electrode is lowered by means of an insulated wire thru the water, and depends upon actual contact with some metallic body for its location. The circuit is formed thru a pair of sensitive head receivers, the bare electrode, the water and the electrode, and normally is of high resistance.

Recording Telephone

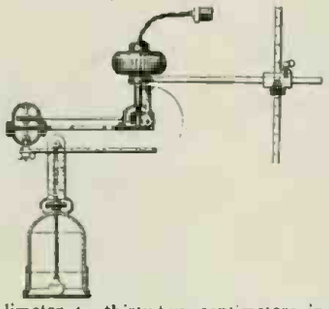
(1,290,621; issued to John F. Malthaner)



A new form of recording telephone, more or less on the style of the dictating telephone. A device in convenient size and weight for use on office desks, etc. It is so constructed that it may be used for receiving direct dictation over the phonograph, and also may be used to receive telephone messages from the ordinary telephone receiver, and in this manner to record the same on a phonograph record. Particular attention is attached to a new form of reed diafram constructed of the same width from end to end; approximately at its center is mounted a square soft iron disc held in place by clips, which on its underside has a holder for supporting the saffire point of the phonograph.

Advertising Lamp and Radiometer

(1,290,749; issued to Edward J. Hunt)

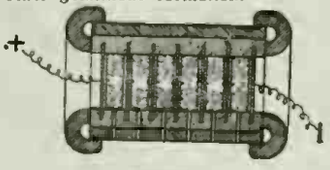


The device consists of a motor operating on the principle of the radiometer, in which the moving motor elements are caused to rotate upon their axes by the action of light. The device is primarily intended to be inserted with the enclosure of any ordinary incandescent lamp bulb and combined with the filament support in a manner permitting the use of the usual lamp filament, so that the light issuing therefrom shall cause the rotation of the several motor vanes. The motor element consists of a series of vanes, preferably four or more, which are silvered upon one side and blackened upon the other side with carbon or lamp black.

Radium-Applicator

(1,288,048; issued to George Kunkle)

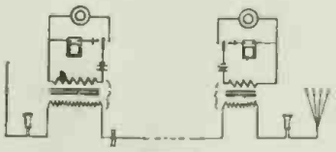
A radium applicator adapted for the use of radium and other radioactive salts. The applicator is properly calibrated in advance and so arranged that the physician using it can accurately measure and administer by any of the approved methods the correct dosage at any moment by a simple adjustment of its parts. This instrument automatically and evenly irradiates surfaces of widely variable areas, as, for instance, areas of from one mil-



limeter to thirty-two centimeters in diameter.

Secondary Or Storage Battery

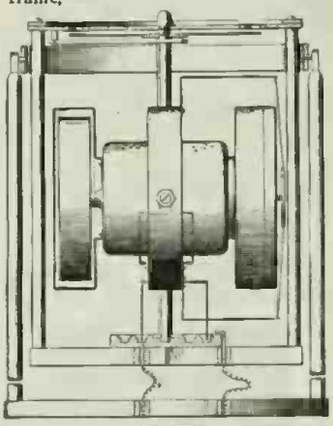
(1,285,660; issued to Bruce Ford)



A new type and form of storage battery, its principal object being to minimize leakage between cells and still have a multiple voltage battery of sufficient strength to withstand the stresses and wear acting on such a battery. The structure may be described as a number of plates having a central portion, one face provided with a negative formation and the other face having a positive formation, with a rim projecting beyond both formations so as to fit and be prest into soft rubber tubing, which will make it nonleakable. The spaces between are filled with an electrolyte, which may be any plain liquid, or else held soaked in blotting paper or some other gelatinous formation.

Method of Telephonic Transmission Without Return-Wire

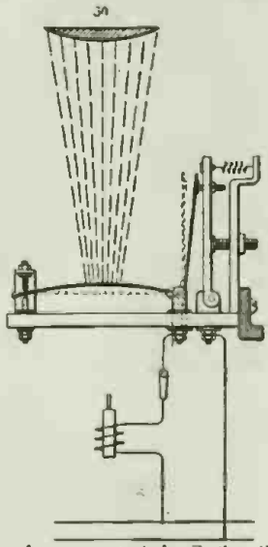
(1,287,180; issued to C. Bardeloni)



A new method of transmitting speech without a return wire. It is sometimes necessary to use a single wire for telephonic transmission without earthing its end. A condition like this might exist in connection with an observation balloon where the stringing of the separate telephone cable would not be feasible. Under these conditions the circuit does not close by conductivity, but remains as an open circuit, the return being formed by one or more metal conductor squares, electrostatically and electromagnetically connected between each other. This invention has the object of effecting telephonic transmission by the variations of the electrostatic and electromagnetic conditions, without any metallic conductors, or the earth, connecting the extremities of the system.

Compass-Gyroscope

(1,289,813; issued to Emil Klahn)



The invention consists primarily in mounting the gyroscope so that at all times it is unaffected by gravity, and in utilizing this potential function of the gyroscope to regulate the position of the controlled member, when a disturbing force is acting on the gyroscope. Its application is mainly a non-magnetic compass, when such disturbing or directive force results from the rotation of the earth, and for movements and changes in the course of a vessel carrying the compass, and apparent rotation of the compass card or controlled member taking place and serving as a measure of the change in course. The gyroscope is a means to partly suppress freedom of rotation about its vertical axis and a frame within which said gyroscope is pivotally mounted. A resilient means is connected with the frame adapted to work on the gyroscope, when the control member or compass card is in connection with said frame.

Thermostat

(1,287,188; issued to Henrich Beck)

A new design of thermostat, which to a certain extent eliminates many of the troublesome factors of the old style instrument. This type of thermostat is one which employs but one movable contact, the other being fixt, altho adjustable, and the two thermostat elements generally control the single movable contact, in response to a variation in temperature. But only one is subject to the action of radiant heat, and acts directly upon the carrier, and thereby acts directly upon the movable contact. The heat ray

may be concentrated on the thermostatic element by means of a condensing lens. When the element is at a normal room temperature it is straight, but when the radiant heat strikes the thermostatic element, then it curves slightly upward, moves a crank upon the carrier, which presses the fixt contact, thereby closing the circuit.

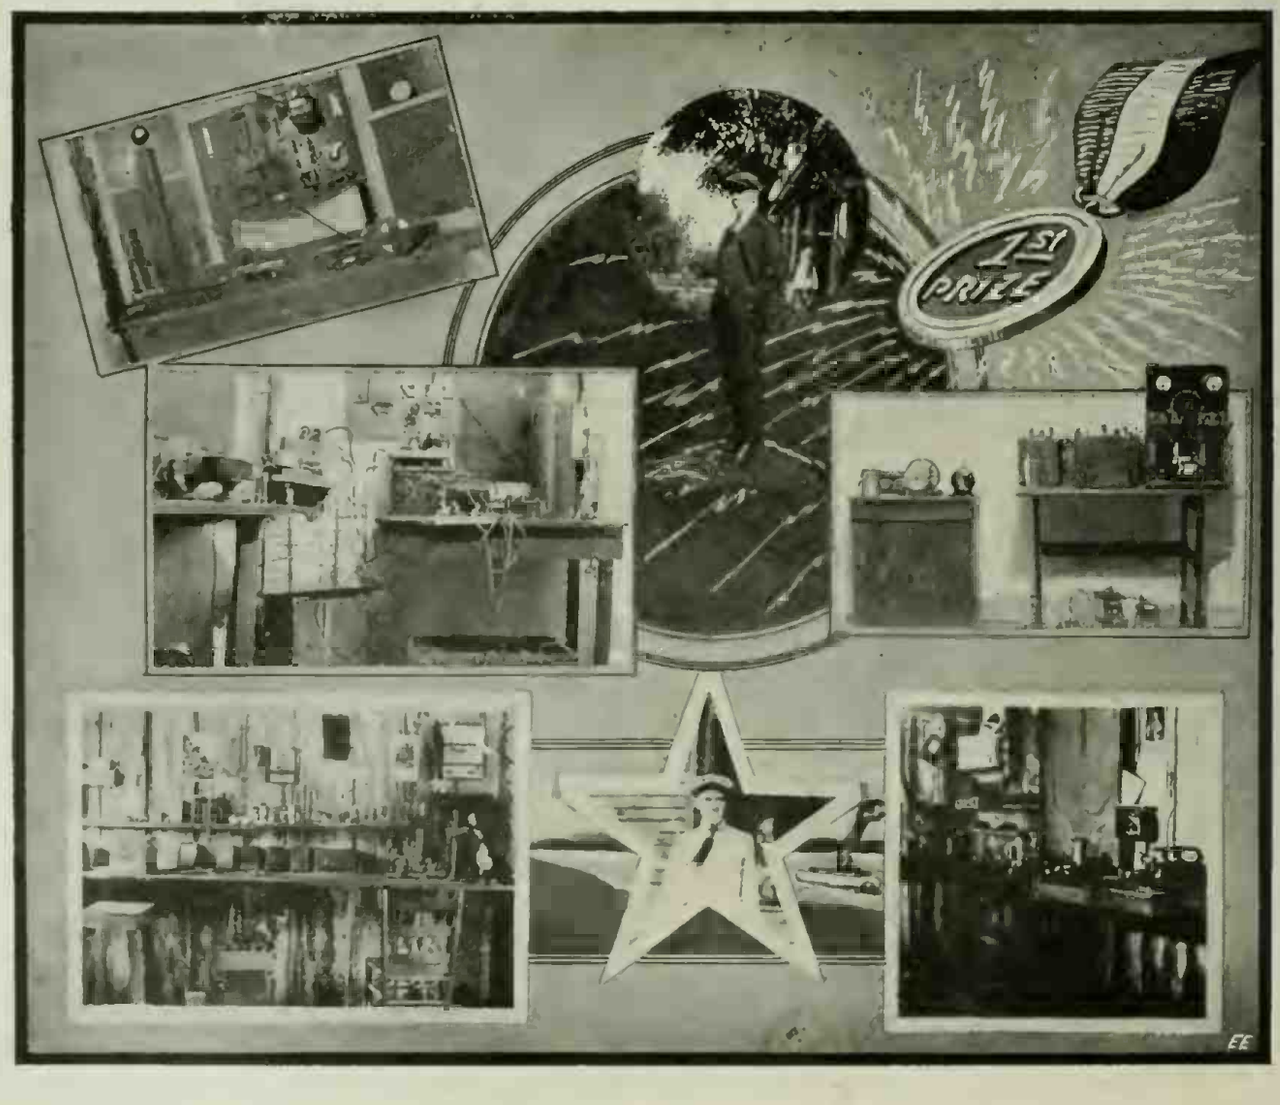
With the Amateurs

Our Amateur Laboratory Contest is open to all readers, whether subscribers or not. The photos are judged for best arrangement and efficiency of the apparatus. To increase the interest of this department we make it a rule not to publish photos of apparatus unaccompanied by that of the owner. Dark photos preferred to light-toned ones. We pay $3.00 prize each month for the best photo. Address the Editor, "With the Amateurs" Dept.



"Amateur Electrical Laboratory" Contest

THIS MONTH'S $3.00 PRIZE WINNER—RAYMOND L. CASSELL

HEREWITH I present three pictures of my Electrical Laboratory. In this "Lab" you can find anything from a binding post to a six hundred thousand volt Tesla coil. I have constructed two high potential transformers and one welding transformer with an output of three volts and five hundred amperes. Practically everything in this "Lab" was built by me. There are several motors, both A. C. and D. C., dynamos, about a dozen spark coils, transformers, storage batteries, small steam engine, rectifiers, Tesla coil (Oudin type), switches of all kinds, telegraph instruments, condensers, volt and ammeters, et cetera. I can get a twelve to fourteen inch spark from the Oudin coil. If the spark is not drawn off, it will brush discharge to a length of ten inches, crackling and waving like a thing alive. I perform some very interesting experiments with the coil. I also have a small storage battery set with a separate switch-board for charge and discharge. I have a search-light (arc), which will throw a beam about two miles. I operate this on a 110 volt circuit with a transformer built for the purpose. I am now building a 330 watt D. C. dynamo. I experiment with about everything going and a lot more.—Raymond L. Cassell, Roanoke, Va.

HONORABLE MENTION (1 year's subscription to the "ELECTRICAL EXPERIMENTER")—J. H. ENGLAND

HEREWITH are photographs of my Laboratory. In one of the photographs may be seen my "Wireless Table," which contains all the different instruments used for both sending and receiving. The transmitting set consists of a ¼ K. W. step-up transformer, condensers, spark gap, key, ammeter, et cetera. There is also a 1 inch spark coil for sending short distances. For receiving I have used successfully (before the war) a tuning coil for short distances and a loose coupler for long distances, in connection with a silicon detector, 2,000 ohm Brandes' phones, loading coil, variable and fixt condensers. To the left may be seen my switch-board, which is home-made. It contains a number of different switches, a buzzer, a lamp resistance, and a pilot lamp. To the left of the switch-board there are several shelves on which are different electrical books, such as "Hawkin's Electrical Guides," Houston's "Electricity in Everyday Life," and many others. There are various other instruments on this table, such as telegraph key and sounder, electric fan, Solderall torch, and an interrupter. Another photograph shows the chemical and and photographic table. This table consists of a complete developing and printing set. To the left will be seen the printing box, which is home-made. The frame is an Auto Mask Printing Frame and is secured to the box by means of small hooks, so as to permit it to be removed easily. Inside there is a red and a white light. To the right there are a large number of chemicals, such as nitric acid, bromin, sodium, et cetera. This part of my "Lab." comes in handy when I need a picture of some electrical experiment. This laboratory is the result of but one year and a half of earnest work and study.—J. H. England, 509 George, Greenwood, Miss.

Science in Slang

Jazz Stokes on Wireless Dope

By EMERSON EASTERLING

"I SAW a while back in a paper that Tesla and Marconi were expressing their ideas on interplanetary wireless communication. It don't look very reasonable to me that it could be done in the way that they proposed it, but I don't say that the feat is impossible," remarked Jazz Stokes the other night.

"How does a wireless wire?" asked Bender.

Heiney Hertz — Who While Monkeying Around Spark Coils and a Micrometer Spark Gap, Fell over the Hertzian Wave.

"It don't wire, that is why they call it wireless," returned Jazz.

"Well," I put in, "of course, Punk and I know all there is to know about wireless; but for Bender's sake I wish you would tell us a little about wireless."

"You are probably familiar with the African tum-tums and the Indian signal fires," he began. "They were the original form of wireless.

"A scientist by the name of Hertz. Herr Heinrich Hertz, got to monkeying around with spark coils and developing the micrometer spark gap or resonator. This apparatus worked on the principle that electro-magnetic waves radiate from a point of discharge. The twinkling spark between the gap was due to induced current, being virtually a secondary coil of one turn. Well, this set Heiney to deducing, and he deduced the present Hertzian theory of wireless wave radiation.

"While Hein*rich*, never having caught up with the second syllable of his first name, died a poor man. Nick Tesla hadn't been napping either. The whole wireless dope to this bird was an unsealed book as early as 1893, when Marconi still slid down the banister in his knickers. Thus we see Nikola two-stepping it nonchalantly to the Pat. Office, where he grabs the first REAL wireless patent along in 1900. The old boy had it all down in black on white, aerial, ground, spark gap, *et al*—the real, honest to goodness dope. This earned him the title of "Papa of the Wireless." But in those days there were no detectors and few experimenters to boot. So the then wiseacres sniffed at Nick's Patents, tapt their foreheads significantly and made known that this wireless stuff was all loco, bunque, and then some. The same ginks today however sing a different tune and admit that in 1900 THEY were fast asleep and deader than an Egyptian mummy, with heads as solid.

"Then along comes Kid Marconi and devils around with oscillators, sending waves thru buildings and other masses until he gets to work and builds a real wireless telegraphing station. By sticking his aerials up so as to clear the buildings and other masses he finds that he can send and receive for miles instead of blocks. In 1901, on the twelfth day of December, he shoots a 'can-you-get-it' across the Atlantic—and they got it. Soon all the first class vessels were equipt with radio men and added antennae to their rigging, so that they could let the world know that all was off with them by their C. Q. D. and S. O. S. yelps, instead of leaving floating spars upon the briny deep for some brig to sight later.

"Marconi went on improving his apparatus and handled the financial end so that besides being a first rate experimenter and Italian gentleman of standing, he don't have to eat macaroni with a pencil.

"The world wallows along, and the patent offices pile up the documents in the wireless department, when an ardent bird, Dr. Lee de Forest, waltzes on the stage of industry to the tune of "N' EVERYTHING' and shows us *something*. You might mistake it for an incandescent bulb, but it is as much like a light globe as a Victrola is like a centre table. We call it the Audion Amplifier, and with it in your receiving set you are able to make a squeal a scream. The wireless nuts first found that it was a scream when the ionizing sunlight failed to close the Hula-hula island and 'Frisco communication in the wee sma' hours of the morning, after the hour that the other detectors went bad on 'em.

"For Bender's sake I will give you 'Kicks'* the line up on a simple wireless station. First the transmitting apparatus obtains its juice from batteries or other sources. Is that plain? Yes, well next there is a spark coil that steps the voltage up to a dangerous stage and a spark gap that lets the high tension current break down across the air space. This discharge sets up an oscillating current of high frequency. To increase the efficiency there are condensers inserted in the circuit—these store

Doc "Nick" Tesla—Papa of the Wireless, Who Grabbed the First REAL Wireless Patent in 1900

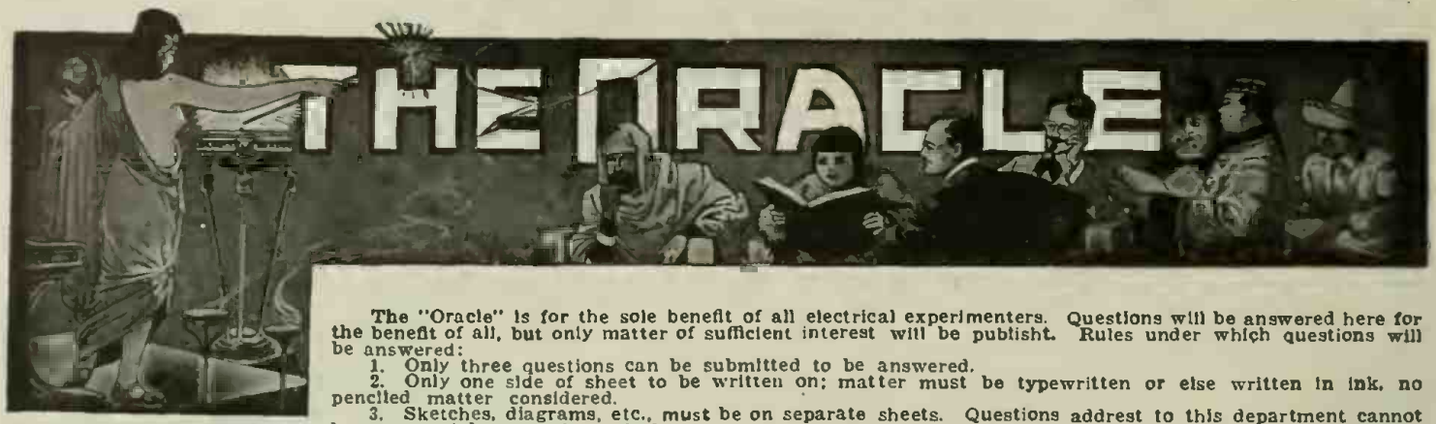
up and discharge the juice like a nigger squirting prune juice thru his teeth, only very much faster."

Taking a pen and pad from his pocket, Jazz proceeded. "It is like this—see the K is the key; C, coil; c^1, condenser; A, aerial; G, ground; and B is for the source of juice. Then the receiving station is like this—A, aerial; D, detector; R, receiver. There is added more stuff to sensitize the layout, but they would only look like a telephone central station wiring diagram here on paper, and besides, there are more different kinds than there are ways for a young boy to go wrong.

"In Guglielmo Marconi's original contraption the Signor used a *coherer*, where we use a detector or audion now. The coherer works by being welded by the incoming waves, the electrical resistance being less when the filings in the coherer are welded. The current is so regulated that when the wave waltzes in and unites the nickel and silver filings, the sounder that is connected in the circuit bangs down with a faint tap. The coherer is tapt by a de-coherer, jarring the nickel and silver filings loose for the next dot or dash—*ad infinitum*.

"The detector rectifies the oscillating current, making it fit to vibrate the diafram on the receiver that the 'Radio-bug' has glued to his ear.

"The audion is an incandescent bulb with a parallel grid and plate, working on the theory that current will flow



Kid Marconi Who Deviled Around Oscillators and Who Shot "Can-You-Get-It" Across the Atlantic.

*That word is Kick and not Hick. Kick is a San Francisco slang word—it means almost anything, originating from a kick in booze and now applying to almost anything, good, bad, and indifferent.

The "Oracle" is for the sole benefit of all electrical experimenters. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be publisht. Rules under which questions will be answered:

1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no pencilled matter considered.
3. Sketches, diagrams, etc., must be on separate sheets. Questions addrest to this department cannot be answered by mail free of charge.
4. If a quick answer is desired by mail, a nominal charge of 25 cents is made for each question. If the questions entail considerable research work or intricate calculations a special rate will be charged. Correspondents will be informed as to the fee before such questions are answered.

500 K. W. DYNAMO DEVELOPS BURNT SPOTS ON COMMUTATOR.

(990) Geo. W. B., Chicago, Ill, inquires of the "Oracle":

Q. 1. What causes commutator bars to burn, blacken and roughen up in the following manner? There are about 4 bars under a set of brushes and every set of 4 bars spaced equally between centers of field poles will blacken. Description of machine: D. C. 500 K. W. rope drive, 8 poles, compound wound. 220 volts. Even airgap all around, commutator undercut, commutator true, field coils equal strength, no reversed coils, no overload, machine runs alone most of the time; sometimes in parallel with a 150 K. W. Brushes have a perfect gloss, practically no sparking. Four hundred segments to the commutator, all tight. Sanding commutator stops the trouble for 2 to 6 months. What causes it?

A Large Dynamo Armature Develops Burnt Spots on the Commutator at Equally Spaced Points, Corresponding to the Pole Pitch. One of the Remedies Suggested Is That the Armature Be Equipt with Balancing or Current Equalizing Rings, as Here Illustrated, which Shows Them Applied to a Parallel-Wound D. C. Dynamo Armature. These Rings Help to Equalize Any Heavy Cross Currents In the Armature which Might Produce Such Troubles.

A. 1. We were particularly interested in the phenomenon you describe where the 500 K. W. D. C. dynamo, which altho apparently in perfect shape and maintenance, develops burnt spots all around the commutator at points corresponding to the spacing of the brush studs.

The Editor of the Oracle, while serving as engineer in a large power house some years ago, had similar trouble, and it practically defied solution by any of the experts who attempted to remedy it. Also in this case, it is clearly recollected that the machine, of about the size you mention, was in very fine running condition, and everything semed to be in favor of its perfect operation. But still these spots developed just as you state. After some thought on the matter it would seem from later experiences, that some of the following troubles might be the cause of these burnt spots appearing on the commutator:

ODD PHOTOS WANTED AT $1.00 EACH!!!

Now is the time to make your Kodak pay for itself in a real practical way. We are after interesting photographs of out-of-the-ordinary electrical, radio and scientific subjects and are willing to pay $1.00 *cash for every one we can use. Please bear in mind that for half-tone reproduction in a magazine, a photograph should be particularly sharp and clear. Of course, if a subject happens to interest us particularly well, we can have the photo retouched. For the general run of subjects, however, it does not pay to go to such expense. Therefore, please take pains to properly focus and expose your pictures. It often happens that a really mediocre subject well photographed wins approval over an excellent subject poorly photographed. And don't send us plate or film "negatives"; send unmounted or mounted "prints", preferably a light and dark one.*

As to what to photograph: Well, that's hard for us to say. We leave that up to you, and every reader now has the opportunity to become a reporter of the latest things in the realm of Electricity, Radio and Science. But, please remember—it's the "odd, novel or practical stunts" that we are interested in. Every photo submitted should be accompanied by a brief description of 100 *to* 150 *words. Give the "facts"—don't worry about the style. We'll attend to that. Enclose stamps if photos are to be returned and place a piece of cardboard in the envelope with them to prevent mutilation. Look around your town and see what you can find that's interesting.*

Address photos to—Editor "Odd Photos", ELECTRICAL EXPERIMENTER, *233 Fulton Street, New York City.*

1. From experience with several smaller machines, especially motors on elevator service, it would seem that field discharge currents, which are often of very high instantaneous e.m.f. value, would be liable to cause this burning. The remedy, or rather safeguard, against such trouble from this source would be to provide a field break switch fitted with an extra contact, so that when the switch is open half-way it makes connection, so that the field can discharge thru a resistance. This resistance in some cases has been formed of a lamp bank, and if you try this, you will be surprised to see how brightly the lamps flash up whenever the field switch is open, i.e., when the dynamo is being shut down and after the main D. C. bus-bar switch has been opened. The field magnet, of course, possesses very high self induction, and when the field switch is opened, a very high self-induced current occurs in the field windings, tending to prolong the magnetization, and causing therefore, a very heavy current of high e.m.f. to occur when the switch is suddenly opened. Practically all dynamos above 50 K.W. capacity are and should be provided with proper protective field discharge resistance and field break switches of the type described.

2. It seems that insufficient brush tension would also cause this trouble, not perhaps while the machine is rotating at its normal speed and load, but due to a tendency which the brushes in such a case might have to jump when the machine was started.

3. Another possible but hardly probable source of this burning might be traced to *hard* commutator bars. High mica would also cause the trouble, but as you state, in your particular case the mica has been undercut.

4. Trouble is often experienced in power-station work where two or more dynamos are run in parallel, and especially if there is any weakness in the design of the equalizing circuit between the two or more machines, which may cause heavy cross currents to pass between the two machines. As you will readily conceive, such a current which might be caused by a parti l unbalancing of the load between the two machines, might cause a momentary and in fact a fairly high e.m.f. transitory current to pass thru the brush and commutator system of one of the machines, and such a current would tend to have the effect of producing the burnt commutator.

5. Another trouble which would seem to point very strongly as a frequent source of this trouble, and one also that is very often overlooked entirely, is the *unequal distribution of the armature current* in such a large machine as this. The Editor recollects a case at one of the southern universities a few years ago, where no end of trouble was experienced in the operation of a large D. C. generator unit, due to this very reason, i.e., the unequal distribution of the current thru the armature windings. This defect in design, for that, of course, is what it is, causes a number of current paths to be set up periodically around the armature, and comparatively heavy currents will start flowing around these paths, their area being that enclosed between the axial lines of the two field poles in most instances. In the case in question, this was finally solved by the proper designing and installation of

The Opportunities In Draftsmanship

By CHAS. W. MOREY
President Chicago Technical College

During the twenty-five years in which I have had exceptional opportunities to observe the progress of technical work of every character, I have never known of such opportunities as exist today for competent draftsmen.

Very naturally the war had a great effect in producing the present conditions. Men were called from the drafting room to the trenches, leaving great gaps in our industrial organization which have not yet been filled.

And now when the war is over, we find many men not returning to their old jobs. We see business pushing harder than ever for markets. We hear of great building operations to be undertaken. We see a vast area of Europe devastated beyond description, to be rebuilt and very largely I believe with American material and with the help of American technical experts.

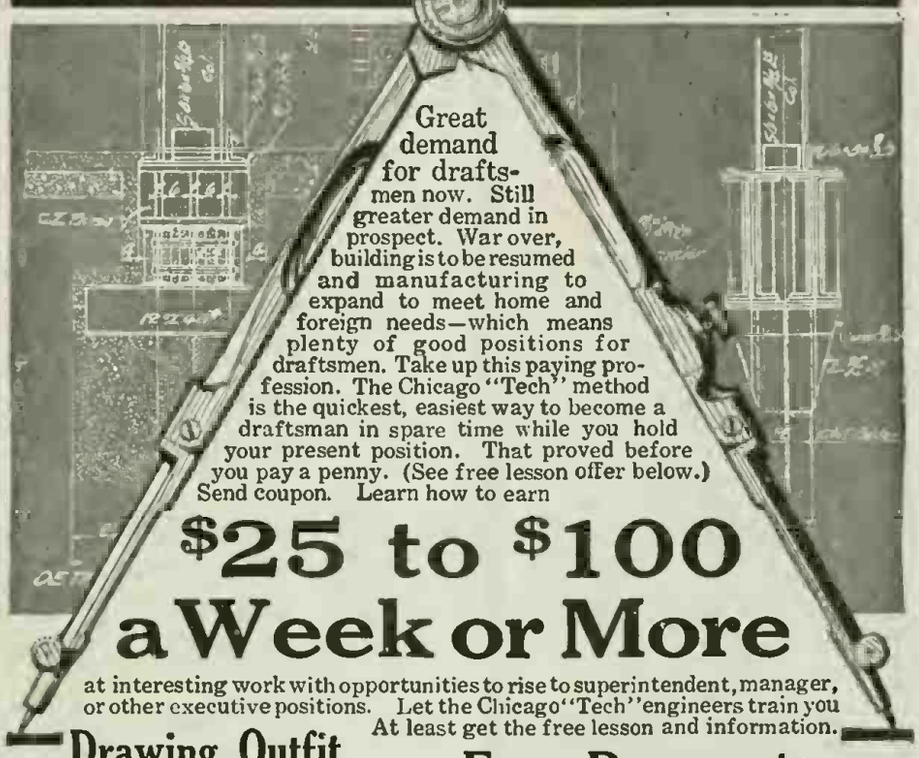
When it is considered that the draftsman must be employed on every detail that goes into the manufacture of structural work of every kind, machinery, ships, railroads, buildings, etc., the vast field for men in this profession can be somewhat appreciated.

The problem before thousands of ambitious young men is not whether to become draftsmen or not, but how and where to learn most quickly and thoroughly.

Formerly it was necessary to attend a resident school, which often meant giving up a position and spending time as well as money. It also often meant, if a man wanted to graduate, taking studies not really bearing upon technical training. Some got their training in drafting rooms of factories, architects' offices, or other places where they started out as boys and slowly worked their way up.

It has remained, however, for correspondence instruction to give every man a chance to become an expert in any branch of draftsmanship without leaving any job he may have and as quickly as his industry will let him pass from one lesson to another.

The Chicago Technical College by its method of training has prepared and is now preparing men everywhere to study in spare time at home and then to step into high-paying positions.



By this method no time is wasted on unnecessary branches. The student gets exactly the training he will use in practical work and in every case he has the direct personal instruction of specialists in the branch he has selected.

Before he decides about enrolling, any man can easily find out just how well qualified he may be to follow Draftsmanship. A test lesson is sent free to show the plan of instruction and to give the prospective student a chance to "size himself up."

We are ready to help ambitious men to get into this great profession with the least expense of time and money. We here know what the opportunities are. The calls we have to furnish good draftsmen to every kind of an organization prove every day that the job is always ready for the man who can fill it. If young men throughout the country could only realize what a future there is in Draftsmanship, many a one now wondering what his future is to be would come to a quick decision.

I hope that every reader of the Electrical Experimenter who is now doubtful about the calling he is to follow will write for information on one of our Drafting courses. If in doubt about which branch to take up, a letter sent to me personally will bring suggestions based on my own experience and that of our staff.

Make a Bigger Income
Learn Draftsmanship

Great demand for draftsmen now. Still greater demand in prospect. War over, building is to be resumed and manufacturing to expand to meet home and foreign needs—which means plenty of good positions for draftsmen. Take up this paying profession. The Chicago "Tech" method is the quickest, easiest way to become a draftsman in spare time while you hold your present position. That proved before you pay a penny. (See free lesson offer below.) Send coupon. Learn how to earn

$25 to $100 a Week or More

at interesting work with opportunities to rise to superintendent, manager, or other executive positions. Let the Chicago "Tech" engineers train you At least get the free lesson and information.

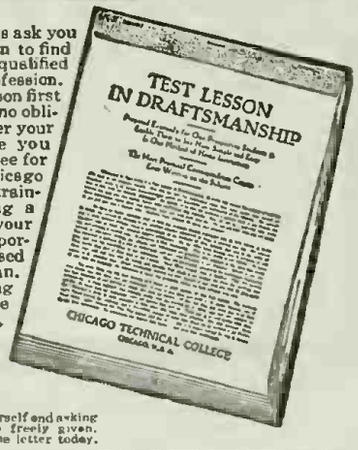
Drawing Outfit

(No Extra Charge)

Every student of the Chicago "Tech" Home Study Course in Draftsmanship receives this drawing outfit—set of instruments in case, drawing board, T square, triangles, scale, curve, drawing paper, pencils, etc., or a cash credit in case he already has an outfit. You use them while learning—then take them right into your practical work.

NOTE: Enrolled with Chicago "Tech" you have the personal direction of practical engineers, builders and architects who teach you the methods they use in their own work. No useless theories, no time wasted. You are prepared to stand beside old, experienced men. Big advantage to learn from a staff like this—every man a specialist.

Come To the College or TRAIN at HOME



Wherever you are you can have this Chicago "Tech" training. Complete instruction by mail. Exercises, lessons, personal direction of our experts right in your own home if you cannot come to the college for a resident course. Send the coupon and get the facts.

Easy Payments

The fees for Chicago "Tech" courses are very moderate—and you can pay on easy terms. And also—you can obtain in a few months what it would take several years to acquire by ordinary methods. You can get an early start. You are soon ready to take a paying position and to quickly get back the cost of your course.

FREE TEST LESSON

Other institutions ask you to pay first—and then to find out later how well qualified you are for this profession. We send the free lesson first and place you under no obligation at all. Discover your qualifications before you pay anything. And see for yourself just what Chicago "Tech" offers you in training which will bring a ready market for your services and open opportunities which are closed to the untrained man. The coupon will bring all the facts about the course, the small fee, and the easy terms.

Mark with X the branch you are interested in—or if in doubt about which course to take, write a letter stating facts about yourself and asking our advice which will be freely given. Mail either the coupon or the letter today.

Auto and Gas Engine Course

All about automobile mechanism—its construction, operation and REPAIR—taught by mail. You train directly under the Chicago "Tech" automobile experts. Splendid opportunities open now.

Learn All This in Spare Time

All about the Principles of the Automobile.
All about Gasoline Engines.
All about Power Plants and Transmissions.
All about Carburetors and Fuel Supply Systems.
All about Lubrication and Cooling.
All about Batteries.
All about Magneto Ignition.
All about Starting and Lighting Systems.

Know How To Fix Troubles

Most complete instruction in auto repair work. Equips you for high pay or to start a business. Big demand for trained repair men.

Write Send the coupon and get catalog and all information now.

CHICAGO TECHNICAL COLLEGE,
445 Chicago "Tech" Building, Chicago

Without obligation upon me, send your Catalog on subject indicated below. Also FREE Lesson if inquiry is on Drafting or Plan Reading. Mark X opposite work in which you are especially interested.

THE ORACLE.

(*Continued from page 886*)

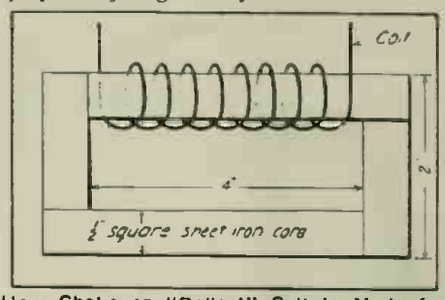
current equalizing rings placed on the back of the armature, as shown in the accompanying illustration.

Many different windings have been proposed and used successfully, but the majority of direct-current armatures are wound with either the single-parallel ring winding, the single-parallel drum winding, or the single-series drum winding. The single-parallel drum winding is probably more used than any other, and, on large multipolar machines, any unbalanced condition in the magnetic circuits is likely to cause the current to divide unequally among the several paths thru the armature. For example, if the air gap on one side of the armature becomes *slightly shorter* than that on the opposite side, which may easily occur due to wear of the bearings, the flux in the short air gap will become unduly dense, thus causing the generation of higher e.m.f. in the armature conductors on that side than in those on the other side, and the path that develops the highest e.m.f. takes the greatest share of the current. In some cases this unbalanced condition may not be bad enough to cause trouble other than some slight sparking, but in extreme cases, the e.m.f. of one path or of the paths on one side of the armature may become so excessive as to reverse the current in some of the other paths, making part of the armature act as a generator and part of it as a motor at the same time. This condition is usually accompanied by severe vibration of the whole machine, due to excessive mechanical strains, with more or less violent sparking or flashing at the brushes, and the machine is said to be "bucking." On account of the effects of armature reactions, bucking is somewhat more liable to occur in motors than in generators. The bad effects due to unbalancing can be eliminated by providing the armature with equalizer rings as shown. By means of equally spaced leads these rings connect points of equal potential in the winding and allow an equalization of current between the various paths in the armature.

Sometimes erratic line disturbances, motor flare-backs, defective motor control apparatus, will cause the effect you describe.

We would recommend that you look up some of the better class books on D. C. machinery operation and design, particularly those by Hobart and Parshall, which you can procure at your local library.

BALLAST COIL FOR ALTERNATING CURRENT ARC-LAMP.



(991) Henry Tustin, Ocean Grove, N. J., writes:

Q. 1. I am having trouble in operating an experimental arc-lamp on 110 volts. What can you suggest?

A. 1. Regarding the operation of arc lamp at 110 volts house lighting current, you do not state what kind of current you have, whether alternating or direct. For one thing, this factor would determine whether your experiment would be a success or not, for the reason that if you are trying to operate the arc on alternating current, then you will find invariably that it will not operate well using a simple resistance coil or rheostat in series with it.

For alternating current operation the proper *ballast* is always composed of an adjustable impedance or choke coil made up of an iron wire or laminated sheet iron core on which several layers of magnet wire are wound. Where an ordinary 1,200 C. P. arc, such as used in ordinary store lighting, etc., is employed and taking about 5 amperes on a 110-volt circuit, the impedance coil may be composed of an iron core about 4" x 2", as shown in the diagram, and on one leg of which is wound about six layers of No. 14 D. C. C. magnet wire, taking off taps from the third, fourth, fifth and six layers.

We very strongly surmise from the symptoms you give in your letter concern-

How Choke or "Ballast" Coil Is Made for Use in an A. C. Arc Lamp Circuit. This Takes the Place of the Resistance Coil in a D. C. Arc Lamp.

ing the failure of the arc to operate, that this is the trouble, as on A. C. circuits *resistance* will give a very poor break spark, and for this purpose there is required an inductance of the order described above.

HOMOPOLAR DYNAMO.

(992) O. S. M., U. S. N. R. F., writes:

Q. 1. Giving a sketch of a commutatorless D. C. dynamo which he has invented and believes to be entirely new.

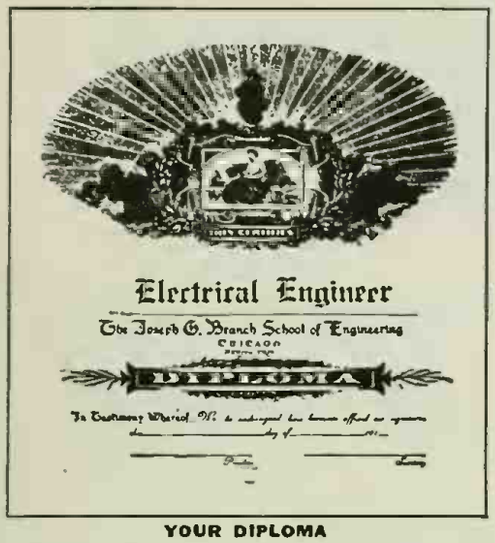
A. 1. We have looked over your drawings and description of what you term a direct current commutator-less dynamo, and while you appear to have something new in the peculiar design of the pole-shoes of the field magnet and the arrangement of the armature inductors, the whole principle of this type of dynamo has been known for the last forty years or more.

In other words what you have shown is simply the well-known "homopolar" dynamo, also called the "unipolar" dynamo. Faraday's first disk type dynamo belonged to this class. All machines of this type have the disadvantage of producing a very low electromotive force or voltage and are not usually practical, altho a few machines of this type have been used, where a very heavy current at a potential of a few volts was desired. You will find all the information you may desire in this direction by referring to the following works:

"Elementary Lessons in Electricity and Magnetism," by Silvanus Thompson, page 498. Also you would do well to refer to Professor Thompson's complete treatise, "Dynamo Electric Machinery," and a most thoro work covering the complete design and calculation of the electrical as well as the magnetic circuits of the "homopolar" dynamo is given in Prof. Alfred E. Wiener's excellent book, entitled "Continuous Current Dynamo Electric Machinery Design." These books are available thru our "Book Department."

The outline of the action of the machine you show is in accordance with the opinion of this machine given by Prof. Silvanus Thompson, in which he says in part:

"There is a class of dynamo-electric machine, differing entirely from any of the commutating types, in which a coil or other movable conductor slides around one pole of the magnet and cuts the magnetic lines in a continuous manner without any reversals in the direction of the induced currents. Such machines, sometimes called 'homopolar' or 'unipolar', have a very low electromotive force or voltage. Faraday's disk machine belonged to this class."



The stream that has been supplying the ancient city of Damascus with water for forty centuries has been harnessed to provide electricity to light the city and operate a railway.

According to an Italian scientist's figures, a square mile of the earth's surface in six hours of sunshine receives heat equivalent to the combustion of more than 2,600 tons of coal.

You can be a Graduate

ELECTRICAL ENGINEER

YOUR DIPLOMA

Our method of teaching saves you time and money in becoming a graduate, practical, Electrical Engineer—at Big Pay.

There is a large and constantly increasing demand for Graduate Electrical Engineers. Our Diploma is accepted as evidence of a competent, trained electrician. Hundreds of our Graduates are now big, successful Electrical Engineers. They will tell you what we have done for them. We can do the same for you—in your *spare time at home*. Read how these results are accomplished:

Your object in taking a correspondence course is to *Increase your Earning Power*. To learn exactly what you need and not waste your time and efforts on superfluous matter, is the shortest means to that end. The *Joseph G. Branch School of Engineering* specializes in equipping you with the *practical* and *usable* knowledge that enables you to qualify as an Electrical Engineer in the shortest time, yet our course is practical and complete. *This we definitely guarantee.*

You Get Intensive, Selected, Personal Instruction

Our courses are simple, practical and easily understood. Everything is made clear. You do not become involved in difficult technical matter of no practical value, and which is so discouraging to the student, but you go straight into the principles of the subject and the application of these principles. Every one of our students gets *personal* instruction, so that his progress is steady and sure. *You can't fail* with this course if you will simply follow our very clear directions. One of our students says: "Your course is strong for the Engineer. It gives him the vital working knowledge of the subject which makes him a competent Electrical Engineer in a very short time and at a very moderate cost." Many Electricians earn

$2,500 to $7,500 a Year

The course in Electrical Engineering covers the installation and operation of all kinds of modern electrical machinery and appliances, including power plant work, viz.: Practical Electricity, Alternating Currents, the Electric Motor, Practical Mathematics and Electrical Wiring. Under Practical Electricity both direct and alternating currents, high potential and high frequency currents are covered.

You get *everything* that will make you a proficient, *practical* Electrical Engineer—without the loss of time spent on endless theory and difficult technical work of other methods. This has been made possible by the thirty years of practical experience of Mr. J. G. Branch, B.S., M.E., in the engineering field. This is now presented to you in compact, usable and easily learnable form. There is no course which will put you on a big salary basis in so short a time.

THESE BOOKS FREE!

With the Electrical Engineering course you get, FREE, these splendid text books—all *Standard Works*. These books alone are worth more than the price of the course. Each book by a recognized authority:

Practical Electricity
Alternating Currents
Electric Wiring
The Electric Motor Simplified
Practical Mathematics

You need this Electrical Library. Here is your chance to get it *free*.

Due to Mr. Branch's long experience in and close contact with the engineering field the courses embrace such questions as are usually asked by the various Boards of Examining Engineers throughout the country. Our graduates will testify to the ease with which they were able to pass these examinations, and the cooperation received from us in helping them get positions.

A Diploma from the Branch School of Engineering is a sure step to a better position and a larger salary. You can soon have *your* Diploma—without interfering with your present work.

SPECIAL OFFER

The price of the course is extremely low and just now we are making a Special Limited Offer to those who reply to this advertisement. This remarkable offer reduces the cost of the complete course to a very low figure. You will be astonished to find how little this tremendously valuable training will cost you. Mail coupon at once for full particulars and Special Terms. Jos. G. Branch School of Engineering, Dept. 14, 542 Dearborn Street, Chicago.

BOOK REVIEW

A VEST-POCKET DICTIONARY OF TECHNICAL TERMS USED IN WIRELESS. Flexible cloth covers, 168 pages, indexed alphabetically, size, 3¼ x 2½ inches, price $0.75. Publisht by the Wireless Press, Ltd., London, England.

A very useful compendium of the principal wireless terms which should prove useful to all radio operators and students of the art. The various technical terms are arranged alphabetically, and the subject matter given seems to cover most of the more important terms used in radio engineering and operating. Some of the definitions are rather terse, and it seems that they could have been easily amplified without increasing the size of the book very much. For instance, we find the term "billi-condenser," and the definition of the term succinctly says—"consists of a metallic tube made to slide over an insulating tube having a metallic lining." This definition does not mean very much to any radio man, and really it is nothing but a trade definition, while as a matter of fact most of the regular text-books on wireless telegraphy describe this condenser as one having a definite electrostatic capacity of one billi-farad. This little work forms a handy, low-priced compilation of wireless terms which may prove of considerable use to radio students and others interested generally in this line of work.

HAND-BOOK OF CHEMISTRY AND PHYSICS—A READY REFERENCE POCKET-BOOK OF CHEMICAL AND PHYSICAL DATA, by Charles D. Hodgman, B.S., and Melville F. Coolbaugh, M.A. Flexible leather covers, 478 pages, size 7 x 4⅜ inches, price $2.00. Publisht by The Chemical Rubber Company, Cleveland, Ohio.

This work is something out of the ordinary and places in the hands of chemistry students and chemists in general a most excellent collection of tables and formulas worked out, which would require many hours of search thru books on chemistry and physics in order to determine these quantities. There is a large number of tables giving the complete equations for various organic compounds; physical constants of the elements; physical data of organic compounds; qualitative analysis procedure; flame and bead testing; various solutions of salts and other reagents; solubility charts, including a table giving the solubility of organic salts in water; a large number of tables giving gravimetric factors and their logarithms; tables of nitric and surfuric acids, as well as ammonium hydroxid and potassium hydroxid, giving the proportion by weight and the corresponding specific gravities for these various chemicals in solution; tables of sound and heat velocity and conduction; the various properties of saturated steam; co-efficients of thermal expansion; voltage and composition of voltaic cells; sparking potential or dielectric strength, wave length of principal lines of various elements, for spectroscopic and other work; tables giving index of refraction for gases in solution as well as metals and glass, radio-active tables, etc., etc.

This is a practical hand-book which every student of chemistry and physics should not be without. It contains an excellent glossary of technical terms with many chemical equations worked out and completed, also a large number of various physical formulas in mechanics, etc. There is given a considerable number of very useful and practical laboratory recipes, such as those for silvering glass, making of pole test paper, making cross-hairs for telescopes, etc.; various forms of photographic developing solutions for both plates and printing papers, etc. A very complete bibliography is appended at the close of the book, giving a valuable titled list of several hundred works on chemistry and physics. The volume is well indexed.

MILITARY AND NAVAL RECOGNITION BOOK, by Lieut. J. W. Bunkley, U. S. Navy. Cloth bound, 224 pages, 51 full page plates. 18 being in color, size 5 x 7 inches, price $1.00. Publisht by D. Van Nostrand Company, New York City.

This work proved of great value during the war and is one of the best ever publisht on the subject of military and naval organizations thruout the world, giving as it does not only the different insignia of rank in the various organizations of the principal countries of the world, but the customs of the service as well, such as etiquette of enlisted men and officers, etc. This book has been endorsed by the Secretary of the Navy. The treatment starts with the organization of the army bureaus and corps, the composition of the army and its various departments, how the staff is composed, and the divisions into the various arms of the service, such as cavalry, field artillery, coast artillery, infantry and engineers. Then we learn about the various coast artillery districts thruout the United States, the various ranks held in the army, and the duties of the officers holding these ranks, army etiquette and customs including salutes and courtesies in conversation, when and when not to address a lieutenant by his title; how to address a colonel, et cetera.

The succeeding chapters take up the composition of the navy and the organization of the naval force ashore, including an explanation at last, on page 41, of the duties of the Bureau of Steam Engineering, and how it comes about that the "Bureau of Steam Engineering" has to do with the installation of Radio Equipment on ships of the navy and on shore—a nice little poser that has been asked many times thru our "Oracle Department," and of the editors personally every time we meet a "Radio-bug."

Then follow interesting chapters on naval etiquette and customs, including what to do when the officer of the deck passes you, when to stand up, and when to sit down when a naval officer enters a cabin, and when an army officer enters a tent or barracks; what to say and how to say it, why a "gob" or his high superior officer must walk down Broadway in the pouring rain without an umbrella, and also you will find it prescribed in the rules and regulations on naval etiquette, that it is unbecoming an officer in uniform to carry a package of any kind. But at the close of the hum-drum of red tape, which tells you how you shall place your feet, and when you shall take off your hat, also when you can use your handkerchief, and which proves mighty interesting reading to us poor land-lubbers, we come to the most interesting announcement that—"it is customary for a committee of officers, to make the round of calls on New Year's Day on all ships in the same port," and further—"when in Washington, it is customary to call on the Secretary of the Navy and other high officials on New Year's Day, and you shall appear in your full dress uniform," rain or shine, and leave your umbrella at home.

Other chapters treat of the U. S. Marine Corps, the coast guard and the light house service. We then come to the sections dealing with the strength and organization of foreign armies and navies with the insignia of rank printed in colors.

The volume is one of the best works of this kind ever publisht, and Lieut. Bunkley should be complimented on the excellent and very interesting style in which he has compiled the work.

ELEMENTARY NAVAL ORDNANCE AND GUNNERY, by Lieut. H. C. Ramsey. Limp leather cover, size, 4¼ x 7¼ inches, illustrated and numerous drawing plates. Publisht by Little, Brown & Company, Boston, Mass., 1918, Price $3.00 net.

One of the most valuable works publisht during the war as a ready aid to the new students in the Naval Gunnery Schools and also as a guide to instructors and those trying for commissions. It has been prepared in a simple, easy and direct manner so that all classes of readers may readily acquire a correct and thoro knowledge of the fundamentals and general principles of the art of modern naval gunnery.

Most of the material has been gathered from lectures delivered at the Ensign School at Harvard University, and a number of interesting questions asked by students have been incorporated in the work with full answers.

A few titles of some of the more important chapters follow:—Naval Guns, Manufacture of Naval Guns. Gun Mounts, Breech and Firing Mechanisms, Electrical Firing Mechanisms, Turrets, Gunpowder, Projectiles, Magazines, Inspections and Tests, Spotting, Sighting, Fire Control, The Battery in Action, Care of Turrets, Automatic Machine Rifles, Battle Drills, The Gunnery Officer of a Ship, Infantry.

The chapter on Infantry has been included in order that those new to the service may understand some of the newer positions as practised in this branch of the service.

There is no doubt but that this book will fill a very distinct want amongst those who are studying this subject, besides serving to give the layman a real glimpse into what a tremendous part Gunnery plays in every battle engagement whether on land or sea. Lieut. Ramsey is to be complimented upon the excellent style in which he has covered the work in hand. The illustrations are particularly fine and show at a glance just how the breech mechanisms of the great naval cannon work as well as the small arms, including automatic rifles, machine guns, etc. Every kind of projectile is fully explained with sectional drawings, how the powder is placed and computed, calculating the range from a moving war-vessel with the compensations made for wind, speed of target, temperature of powder charge, etc., etc. A most interesting, authentic and valuable work.

Free Proof that I Can Raise Your Pay

No matter how much you are earning now, I can show you how to increase it. I have even taken failures and shown them how to make $100—$200, and in once case as high as $2,000 weekly. I am willing to prove this entirely at my risk and expense.

LET'S have a little chat about getting ahead —you and I. My name is Pelton. Lots of people call me "The Man Who Makes Men Rich." I don't deny it. I've done it for thousands of people—lifted them up from poverty to riches.

I'm no genius—far from it. I'm just a plain, everyday, unassuming sort of man. I know what poverty is. I've looked black despair in the eye—had failure stalk me around and hoodoo everything I did. I've known the bitterest kind of want.

But to-day all is different. I have money and all of the things that money will buy. I am rich also in the things that money won't buy—health, happiness and friendship. Few people have more of the blessings of the world than I.

IT was a simple thing that jumped me up from poverty to riches. As I've said, I'm no genius. But I had the good fortune to know a genius. One day this man told me a "secret." It had to do with getting ahead and growing rich. He had used it himself with remarkable results. He said that every wealthy man knew this "secret,"—that is why he was rich.

I used the "secret." It surely had a good test. At that time I was flat broke. Worse than that, for I was several thousand dollars in the hole. I had about given up hope when I put the "secret" to work.

At first I couldn't believe my sudden change in fortune. Money actually flowed in on me. I was thrilled with a new sense of power. Things I couldn't do before became as easy for me to do as opening a door. My business boomed and continued to leap ahead at a rate that startled me. Prosperity became my partner. Since that day I've never known what it is to want for money, friendship, happiness, health or any of the good things of life.

That "secret" surely made me rich in every sense of the word.

MY sudden rise to riches naturally surprised others. One by one people came to me and asked me how I did it. I told them. And it worked for them as well as it did for me.

Some of the things this "secret" has done for people are astounding. I would hardly believe them if I hadn't seen them with my own eyes. Adding ten, twenty, thirty or forty dollars a week to a man's income is a mere nothing. That's merely playing at it. In one case I took a rank failure and in a few weeks had him earning as high as $2,000.00 a week. Listen to this:

A young man in the East had an article for which there was a nation-wide demand. For twelve years he "puttered round" with it, barely eking out a living. Today this young man is worth $200,000. He is building a $25,000 home—and paying cash for it. He has three automobiles. His children go to private schools. He goes hunting, fishing, traveling whenever the mood strikes him. His income is over a thousand dollars a week.

In a little town in New York lives a man who two years ago was pitied by all who knew him. From the time he was 14 he had worked and slaved—and at sixty he was looked upon as a failure. Without work—in debt to his charitable friends, with an invalid son to support, the outlook was pitchy black.

Then he learned the "secret." In two weeks he was in business for himself. In three months his plant was working night and day to fill orders. During 1916 the profits were $20,000. During 1917 the profits ran close to $40,000. And this genial 64-year-young man is enjoying the pleasures and comforts he little dreamed would ever be his.

I COULD tell you thousands of similar instances. But there's no need to do this, as I'm willing to tell you the "secret" itself. Then you can put it to work and see what it will do for you.

A Few Examples

Personal Experiences

Among over 550,000 users of "Power of Will" are such men as Judge Ben B. Lindsey; Supreme Court Justice Parker; Wu Ting Fang, Ex. U. S. Chinese Ambassador; Assistant Postmaster General Britt; Lieut. Gov. McKelvie of Nebraska; General Manager Christeson of Wells-Fargo Express Co.; E. St. Elmo Lewis, former Vice-Pres. Art Metal Construction Co.; Gov. Ferris of Michigan, and many others of equal prominence.

$300 Profit from One Day's Reading

"The result from one day's study netted me $300 cash. I think it a great book and would not be without it for ten times the cost."—A. W. Wilke, Faulkton, So. Dakota.

Worth $15,000 and More

"The book has been worth more than $15,000 to me."—Oscar B. Sheppard, 1117 E. Locust St., Decatur, Ill.

Would Be Worth $100,000

"If I had only had it when I was 20 years old, I would be worth $100,000 today. It is worth a hundred times the price."—S. W. Taylor, The Santa Fe Ry., Milano, Tex.

Salary Jumped from $150 to $800

"Since I read Power of Will my salary has jumped from $150 to $800 a month."—J. F. Gibson, San Diego, Cal.

From $100 to $3,000 a Month

"One of our boys who read Power of Will before he came over here jumped from $100 a month to $3,000 the first month, and won a $250 prize for the best salesmanship in the State."—Private Leslie A. Still, A. E. F. France.

I don't claim I can make you rich over night. Maybe I can—maybe I can't. Sometimes I have failures—everyone has. But I do claim that I can help 90 out of every 100 people if they will let me.

The point of it all, my friend, is that you are using only about one-tenth of that wonderful brain of yours. That's why you haven't won greater success. Throw the unused nine-tenths of your brain into action and you'll be amazed at the almost instantaneous results.

The Will is the motive power of the brain. Without a highly trained, inflexible will, a man has about as much chance of attaining success in life as a railway engine has of crossing the continent without steam. The biggest ideas have no value without will-power to "put them over." Yet the will, altho heretofore entirely neglected, can be trained into wonderful power like the brain or memory and by the very same method—intelligent exercise and use.

If you held your arm in a sling for two years, it would become powerless to lift a feather from lack of use. The same is true of the Will—it becomes useless from lack of practice. Because we don't use our Wills—because we continually bow to circumstance—we become unable to assert ourselves. What our wills need is practice.

Develop your will-power and money will flow in on you. Rich opportunities will open up for you. Driving energy you never dreamed you had will manifest itself. You will thrill with a new power—a power that nothing can resist. You'll have an influence over people that you never thought possible. Success—in whatever form you want it—will come as easy as failure came before. And those are only a few of the things the "secret" will do for you. The "secret" is fully explained in the wonderful book "Power of Will."

How You Can Prove This at My Expense

I KNOW you'll think that I've claimed a lot. Perhaps you think there must be a catch somewhere. But here is my offer. You can easily make thousands—you can't lose a penny.

Send no money—no, not a cent. Merely clip the coupon and mail it to me. By return mail you'll receive not a pamphlet, but the whole "secret" told in this wonderful book, "POWER OF WILL."

Keep it five days. Look it over in your home. Apply some of its simple teachings. If it doesn't show you how you can increase your income many times over—just as it has for thousands of others—mail the book back. You will be out nothing.

But if you do feel that "POWER OF WILL" will do for you what it has done for over a quarter of a million others—if you feel as they do that it's the next greatest book to the Bible—send me only three dollars and you and I'll be square.

If you pass this offer by, I'll be out only the small profit on a three-dollar sale. But you—you may easily be out the difference between what you're making now and an income several times as great. So you see you've a lot—a whole lot—more to lose than I.

Mail the coupon or write a letter now—you may never read this offer again.

Tobacco Habit BANISHED in 48 to 72 Hours

No craving for tobacco in any form when you begin taking Tobacco Redeemer.

Don't try to quit the tobacco habit unaided. It's a losing fight against heavy odds and means a serious shock to the nervous system. Let the tobacco habit quit YOU. It will quit you, if you will just take Tobacco Redeemer, according to directions for two or three days. It is a most marvelously quick and thoroughly reliable remedy for the tobacco habit.

Not a Substitute

Tobacco Redeemer contains no habit-forming drugs of any kind. It is in no sense a substitute for tobacco. After finishing the treatment you have absolutely no desire to use tobacco again or to continue the use of the remedy. It makes not a particle of difference how long you have been using tobacco, how much you use or in what form you use it—whether you smoke cigars, cigarettes, pipe, chew plug or fine cut or use snuff, Tobacco Redeemer will positively banish every trace of desire in from 48 to 72 hours. This we absolutely guarantee in every case or money refunded.

Write today for our free booklet showing the deadly effect of tobacco upon the human system and positive proof that Tobacco Redeemer will quickly free you of the habit.

The Moon's Rotation

(Continued from page 866)

festly absurd and of no bearing on the question under consideration.

In all the communications I have received, tho different in the manner of presentation, the successive changes of position in space are mistaken for axial rotation. So, for instance, a positive refutation of my arguments is found in the observation that the moon exposes all sides to other planets! It revolves, to be sure, but none of the evidences is a proof that it turns on its axis. Even the well-known experiment with the Foucault pendulum, altho exhibiting similar phenomena as on our globe, would merely demonstrate a motion of the satellite about *some* axis. The view I have advanced is NOT BASED ON A THEORY but on facts *demonstrable by experiment*. It is not a matter of *definition* as some would have it. A MASS REVOLVING ON ITS AXIS MUST BE POSEST OF MOMENTUM. If it has none, there is no axial rotation, all appearances to the contrary notwithstanding.

A few simple reflections based on well establisht mechanical principles will make this clear. Consider first the case of two equal weights w and w_1, in Fig. 1, whirled about the center O on a string s as shown. Assuming the latter to break at a both weights will fly off on tangents to their circles of gyration, and, being animated with different velocities, they will rotate around their common center of gravity o. If the weights are whirled n times per second then the speed of the outer and the inner one will be, respectively, $V = 2(R + r)n$ and $V_1 = 2\pi(R - r)n$, and the difference $V - V_1 = 4\pi rn$, will be the length of the circular path of the outer weight. Inasmuch, however, as there will be equalization of the speeds until the mean value is attained, we shall have $\frac{V - V_1}{2} = 2\pi rn = 2\pi rN$, N being the number of revolutions per second of the weights around their center of gravity. Evidently then, the weights continue to rotate at the original rate and in the same direction. I know this to be a fact from actual experiments. It also follows that a ball, as that shown in the figure, will behave in a similar manner for the two half-spherical masses can be concentrated at their centers of gravity and m and m_1, respectively, which will be at a distance from o equal to $\frac{1}{8}r$.

This being understood, imagine a number of balls M carried by as many spokes S radiating from a hub H, as illustrated in Fig. 2, and let this system be rotated n times per second around center O on frictionless bearings. A certain amount of work will be required to bring the structure to this speed, and it will be found that it equals exactly half the product of the masses with the square of the tangential velocity. Now if it be true that the moon rotates in reality on its axis *this must also hold good for EACH of the balls as it performs the same kind of movement.* Therefore, in imparting to the system a given velocity, energy must have been used up in the axial rotation of the balls. Let M be the mass of one of these and R the radius of gyration, then the rotational energy will be $E = \frac{1}{2}M(2\pi Rn)^2$. Since for one complete turn of the wheel every ball makes one revolution on its axis, according to the prevailing theory, the energy of axial rotation of each ball will be $e = \frac{1}{2}M(2\pi r_1 n)^2$, r_1 being the radius of gyration about the axis and equal to 0.6325 r. We can use as large balls as we like, and so make e a considerable percentage of E and yet, it is positively established by experiment that each of the rotating balls contain only the energy E, no power whatever being consumed in the supposed axial rotation, which is, consequently, wholly illusionary. Something even more interesting may, however, be stated. As I have shown before, a ball flying off will rotate at the rate of the wheel and in the same direction. But this whirling motion, unlike that of a projectile, neither adds to, nor detracts from, the energy of the translatory movement which is exactly equal to the work consumed in giving to the mass the observed velocity.

From the foregoing it will be seen that in order to make one physical revolution on its axis the moon should have twice its present angular velocity, and then it would contain a quantity of stored energy as given in my above letter to the *New York Tribune*, on the assumption that the radius of gyration is 2/5 that of figure. This, of course, is uncertain, as the distribution of density in the interior is unknown. But from the character of motion of the satellite it may be concluded with certitude *that it is devoid of momentum about its axis.* If it be bisected by a plane tangential to the orbit, the masses of the two halves are inversely as the distances of their centers of gravity from the earth's center and, therefore, if the latter were to disappear suddenly, no axial rotation, as in the case of a weight thrown off, would ensue.

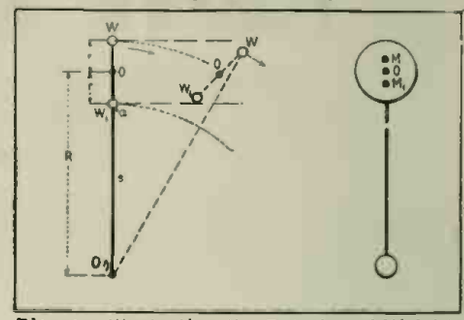

Diagram Illustrating the Rotation of Weights Thrown Off By Centrifugal Force.

WHAT IS MAN?

A man weighing 150 pounds will contain approximately 3,500 cubic feet of gas,—oxygen, hydrogen and nitrogen in his constitution, which at eighty cents per thousand cubic feet would be worth $2.80 for illuminating purposes. He also contains all the necessary fats to make a 15-pound candle, and thus, together with his 3,500 cubic feet of gases, he possesses considerable *illuminating* possibilities. His system contains 22 pounds and ten ounces of carbon, or enough to make 780 dozen, or 9,360 lead pencils. There are about fifty grains of iron in his blood and the rest of the body would supply enough of this metal to make one spike large enough to hold his weight. A healthy man contains 54 ounces of phosphorus. This deadly poison would make 800,000 matches, or enough poison to kill five hundred persons. This, with two ounces of lime, make the stiff bones and brains. No difference how *sour* a man looks, he contains about 60 lumps of sugar of the ordinary cubical dimensions, and to make the seasoning complete, there are 20 *spoonfuls of salt.* If a man were distilled into water, he would make about 38 quarts, or more than half his entire weight. He also contains a great deal of starch, chlorid of potash, magnesium, sulfur, and hydrochloric acid in his wonderful human system.

Break the shells of 1,000 eggs into a huge pan or basin, and you have the contents to make a man from his toe-nails to the most delicate tissues of his brain. And this is the scientific answer to the question, "What is Man?"

www.americanradiohistory.com

"I have watched the progress of the International Correspondence Schools almost from the very beginning. To me their rapid growth is easily understood, because I realize the practical value that is back of them and know something too of the success attained by many ambitious men throughout the country who have taken their courses.

"May your splendid institution continue to so grow and flourish that the world will come to appreciate the actual worth of the I. C. S. trained man."

—THOMAS A. EDISON.

"I am familiar with the textbooks and method of instruction used by the International Correspondence Schools in their Courses in Electrical Engineering, and I also know of a number of young men who have taken these Courses with great benefit. I believe that any young man who is interested in electricity but who cannot find an opportunity to go through an engineering college, if he will apply himself to one of these courses will find it a practical and economical way to acquire a knowledge of the profession second only to that acquired by devoting all the time for years to this study, in a regular college course."

—DR. CHARLES P. STEINMETZ.

What Would Their Advice Be Worth to You?

Suppose you have a knack for things electrical—that you realize what a wonderful opportunity for earnings and advancement the field of Electricity offers. What, then, would it be worth to *you* to have Edison and Steinmetz, the two foremost figures in the electrical world, tell you of a thorough, practical plan by which you can acquire, right at home, the training you need for success?

Well, *here* is their advice, based on years of familiarity with the instruction given by the International Correspondence Schools and on personal knowledge of I. C. S. trained men in their employ:

"I know of the success attained by men who have taken your Courses," says Edison. "It is a practical and economical way to acquire a knowledge of the profession," says Dr. Steinmetz. Read their full statements above.

For 27 years the I. C. S. have been training men at home in their spare time for success in Electricity and 280 other subjects. It is training over 100,000 men and women right now. It is ready and anxious to prepare you for advancement in Electrical Engineering or any special branch of it—or in any other line that appeals to you.

Pick the position you want in the work you like best, then put it up to us to prove how we can help you. Here is all we ask—without cost, without obligation, mark and mail this coupon.

HOW BOY SCOUTS CAN GAIN "WIRELESS MERIT" BADGE.

The committee on badges, awards and scout requirements of national headquarters has just established a "wireless merit" badge which no doubt will become quite popular as soon as there is an opportunity for scouts to perfect themselves in the details. The requirements are as follows:

Be able to receive and send correctly not less than 10 words a minute.

Know the correct form for sending a message.

Be able to tell in own words the principal laws regarding radio communication.

Know at least 10 of the radiogram abbreviations (Q signals).

Be able to name two types of detectors and explain how they work.

Name five minerals used in detectors in the order of their sensitiveness.

Draw a diagram of a simple transmitting set, showing how the following instruments are connected: Source of power (dynamo or storage battery), transformer, condenser, spark gap, helix, key, and explain their function.

Draw a simple diagram showing how to connect the following instrments: Tuning coil or loose coupler, condensers, fixt or variable, detector, 'phones and ground. Tell the use of the above apparatus.

Draw a diagram of three different types of aerials and tell their advantages or faults.

Know how to properly ground a radio set and know what precautions to take during a thunderstorm.

Demonstrate how to rescue a person in contact with a live wire, and have a knowledge of the method of resuscitation of a person insensible from shock.

Write a brief essay on the development of wireless telegraphy.

ELECTRIC DRIVE FOR U. S. WARSHIPS.

America's capital fighting ships of the future will be superior to those of other nations because of their electrically driven machinery, Secretary Daniels told the House Naval Committee recently, in disclosing remarkable results attained by the new dreadnought New Mexico, equipt with the electric drive which is to be a feature of all the big ships authorized since 1916.

The New Mexico's turbo-electric machinery was designed to develop 26,500 horse-power at full speed and to give the ship a speed of twenty-one knots.

"It actually developed more than 31,000 horse-power," Mr. Daniels said, "and maintained for four hours a speed of twenty-one and one-quarter knots, and this when running at a displacement 1,000 tons greater than its design called for.

The secretary said fuel economy at cruising speed had been one of the things sought in substituting electric drive for the ordinary turbine equipment.

Practical Chemical Experiments

(*Continued from page* 880)

TO TEST FOR COAL TAR COLORING.

Experiment No. 3. See Fig. 3.

To test for coal tar colors in butter, a small sample is mixed on a porcelain plate with Fuller's earth, and if coal tars are present, there will be a red mass, while if absent the color will be only light yellow or brown.

Experiment No. 4.

Put a little butter in a test-tube, and a little oleomargarin into another. To each add one inch or so of alcoholic potash solution, and warm each in the steam of the water bath. Distinguish the one from the other by smell. Add a little sulfuric acid (dilute) to each and smell again. Notice that "olco" test tube will only smell of alcohol, but that the other will smell, besides, of butyric ether.

Radium Substitute.

We are all quite familiar with the uses of Radium in medicine and as an ingredient in luminous paint, both of which have been brought to the general public's attention within the past few years.

Luminous paint in particular offers a field whereby a substitute for Radium may be judiciously utilized. This paint played an important rôle in the war which has just terminated, having been used more particularly on the dials of instruments used on airplanes, so that they could be read at night. It has also been used for electric push buttons, door numbers, etc. The paint is permanently luminous in the dark and contains from 0.1 to 0.25 milligrams radium element to one gram of zinc sulfid. A luminous watch face usually contains from ten to twenty cents worth of radium on it.

An excellent substitute for radium for certain purposes is Meso-thorium. This is a radio-active element found in Monazite sand and other thorium minerals. When first extracted it is not satisfactory for luminous paint, and consequently must be "ripened" for several months, or even a year before it can be used. During this time the *alpha* radiation, which is required for luminous paint, becomes sufficiently strong. On the other hand the *beta* and *gamma* radiation of Meso-thorium grows rapidly and it can be used for medicinal purposes within a few days after preparation.

Radium, we are told, has a long life, half of it decaying in approximately 1800 years. Meso-thorium on the other hand possesses a short life, 5 or 6 years being its useful life for luminous purposes. For luminous paint to be used on objects which themselves have a short life, it is an excellent substitute for radium and will conserve the element radium for medicinal purposes only.

Static Electricity and Gasoline.

Static electricity, superinduced by the passage of gasoline thru chamois skin during the filtration process, was declared to be full of great danger. When this idea became prevalent, a well known automobile concern undertook a series of rigid experiments to learn what prospects there were of real danger. Their investigations resulted in their finding that the static electricity scare from the use of chamois skin was without foundation. They claim to have secured authentic data from which it was proved that a static electric charge cannot be developed with the temperature above freezing (32 deg. F.), while at zero (0 deg. F.) the conditions for producing the spark are most favorable.

Two Trade Secrets.

There are two trade secrets at least that the world at large may never know, but which it is well worth the while of inventors to study. One is the Chinese method of making the bright and brilliant color known as Vermilion, or Chinese red; and the other is a Turkish secret—the inlaying of the hardest steel with gold or silver. Among the Chinese and Turks these two secrets are guarded well. Apprentices, before they are taken for either trade, are compelled to swear an ironclad oath to reveal nothing of what passes in the workshop. They must also belong to families of high standing, must pay a large sum of money as a guaran-

Learn Electricity

In the Great Shops of COYNE IN 3½ MONTHS

Thousands of Electrical experts are needed to help rebuild the world. Come to Chicago to the great shops of Coyne and let us train you quickly by our sure, practical way, backed by twenty years of success. Hundreds of our graduates have become experts in less than four months. *You* can do the same. *Now* is your big opportunity. Come—no previous education necessary.

Earn $125 to $300 a Month

In the Electrical business. Come here where you will be trained in these great $100,000 shops. Experts show you everything and you learn right on the actual apparatus. You work on everything from the simple bell to the mighty motors, generators, electric locomotives. dynamos, switchboards, power plants, everything to make you a master electrician. We have thousands of successful graduates. Just as soon as you have finished we assist you to a good position. We now have more positions than we can fill. Think of it.

Become an Expert in 3½ Months

No need of taking from 1 to 4 years to become an expert, we have proved this in thousands of cases. The Coyne method of practical training eliminates all books, useless theory and other non-essentials and trains you in just what you need to know to become an expert.

Earn Your Way

Don't tell yourself you haven't got the money to come to Coyne. If you have ambition and the nerve of a real man, that's all you need. Dozens of our students every year work in their spare time and earn their living expenses. Dozens of others work in the day time, earn all their expense and attend our evening school. Our employment department will help you without charge.

Day or Evening Courses

Don't worry about the money. Anyone with ambition can learn here. Our tuition is low with small easy payments if desired. All tools and equipment is furnished free. Our students live in comfortable homes in the best section in Chicago—on the lake—just a few minutes' walk from our school.

Electricity, Drafting Motion Picture Operating Plumbing

We teach all these trades and professions quickly and in such a thorough, practical way that when finished you are ready to step right into a position of responsibility and big pay.

Send Today for Big Free Book

Write today, *now*, for the book. It tells what Coyne graduates have done. What you can do. Fill in the coupon, check the trade you are most interested in or send a postal card, do it *now*.

Learn Drafting

The country is crying for skilled draftsmen in all lines. Thousands of positions open with princely salaries. We have been able to place every graduate in a good position. One firm asked for all our men. Now is the time to get into this big field. Experts train you under practical working conditions, no books and theory go here. Check drafting on the coupon below and mail it *at once* for full particulars.

DO Your Own PLUMBING AND HEATING at low cost

Send for our big instructive 256 page well-bound Handy-Man Book Catalog. Every Home Owner, Contractor, Electrician, Farmer, Factory Manager, etc., needs it. Shows over 10,000 Fixtures and Supplies in plumbing and heating at wholesale. Shows how to save skilled labor, hard work and unnecessary material by

OUR NEW
Cut-to-fit-Method

This wonderful book helps you select and install the proper Plumbing, Water Supply System, Hot Air, Water or Steam Plant. Besides being our Wholesale Catalog it has many practical plans, diagrams, sketches, elevations, etc., showing how to do the work this newer, cut-to-fit way. Any handy man with a few tools can easily do his own installing with the aid of this

Big Handy-Man Book

We have spared no effort and have gone to a great expense to compile this valuable book. With economy still a National necessity, it would be unpatriotic to send this expensive book broadcast to non-interested parties. Therefore, we request a temporary deposit for each copy of 25c which we refund on first order, or we send our Bargain Bulletin Free. Address Today

HARDIN-LAVIN COMPANY
40 Years At
4510-20 Cottage Grove Ave., Chicago
$500,000 plants behind our guarantee

I Earned $2200 IN FOUR MONTHS

THIS is Richard A. Oldham. He earned $2200.00 in four months with a Haywood Tire Repairing outfit. For 20 years he was telegraph operator on the Illinois Central Railway. He is now 58 years old. He answered my advertisement—quit his job—bought a plant and opened a business. He just wrote me "I have made more in eight months than 2½ years as operator." There are now 500 stations where tire repairing is neglected.

I Must Have 500 Men
To Fill These Positions

I have a Big interesting Book to send you. It tells all about tires—gives inside figures and profit. Send for it! What Oldham and others are doing You can do. $2500.00 to $4,000.00 per year is conservative. Like Mr. Oldham—One machine will start you. Then open a shop. You can see business all around you. Put out a Haywood Sign and business will come to you. Now get started. Send for the Big Book and start making money.

M. HAYWOOD, Pres.
Haywood Tire & Equipment Co.
1209 Capitol Ave. Indianapolis, Ind.

CONSULT US When in need of definite and reliable data concerning trade formulae or industrial processes. When you desire to either duplicate or improve upon a product or process now in use, we can help you, as we are ever on the alert and closely following the development of the industrial art in all its branches. The formulae listed below will serve briefly to show the field we cover: 1—Preparing Solidified Alcohol. 2—Producing Liquid Toilet Soap. 3—Process for Electro-galvanizing Iron. 4—Ink for Typewriter Ribbons (all standard colors). 5—Process for Sensitizing paper which gives excellent prints from line drawings and plan tracings; it supplies copies in white lines on a brown ground. 6—Alloy for Soldering Aluminum. The standard price for each formula issued by this bureau is Thirty-five cents. Letters of inquiry welcomed. Informative literature sent upon request. Industrial Methods Bureau, 320 Fifth Avenue, New York, N. Y.

INTRODUCING
Mr. R. W. DeMott

For eight months past Mr. R. W. DeMott has been advertising manager of your magazine.

You have noticed the rapid growth of "E. E." during that time. One big reason for this astounding growth and betterment of your magazine is due directly to Mr. DeMott and his "ads."

If you have the welfare of your magazine at heart, read Mr. DeMott's message. It means money to you.

The Publishers.

Advertising Talks

You, as a reader of the ELECTRICAL EXPERIMENTER, are vitally interested in every department of the magazine. There are some very strong reasons why you should be doubly interested in the advertising.

The publishers are constantly striving and planning to improve the quality of the magazine offered you each month. But it is your magazine and it is up to you as to how big it shall grow. There are a great many things that you ought to know about advertising, and how this powerful force affects you personally.

Progressive and responsible firms all over the country announce what they have to offer you through the advertising pages of the ELECTRICAL EXPERIMENTER. Not only will you help your magazine by showing an interest in its advertisers, but you will benefit yourself to an even greater degree. I will take up these points one by one each month, and hope that every reader will follow this column and offer any suggestions or ask any questions that may come to his mind regarding advertising and its relation to a big magazine.

If you have any suggestions to make regarding the advertisements that appear, if there is any information you would like regarding advertising in general, write me personally and your questions will be taken up in due course through this column.

For the next few months I will tell you about "E. E." advertising and its relation to you. Each month I will give you one reason more why the advertisements should be of vital interest to everyone of us.

You have watched the EXPERIMENTER grow from a little sixteen-page magazine to its present size. You have watched the class of articles improve, its staff of authorities who contribute each month get bigger and better, finally resulting in the wonderful announcement made in our January issue that the publishers had secured for you the services of the world's greatest inventor, Nikola Tesla, to give you exclusive feature articles in every issue for the next two years at least.

One of the principal factors in this rapid growth has been its advertising.

Next month I will show you how, by reading and answering the advertisements, you will help to still further build up and increase the size of the EXPERIMENTER.

R. W. DeMott

Advertising Manager.

AN OZONE WATER PURIFIER FOR THE HOME.

For use in homes, offices, drug stores, restaurants, hospitals and institutions, a Milwaukee concern has designed a convenient size of Ozone Water Purifier constructed as shown in the accompanying illustration. It is pointed out that in the ozonizing process employed, ozone is produced by means of an electric current and mixed thoroly with the water as drawn from the faucet, so that all water used comes into actual contact with ozone. The extra oxygen atoms of the ozone combine with organic matter of the germs in the water and burn them up. The carbon dioxid formed by this chemical action passes out into the air leaving a trace of the same effect produced in carbonated beverages, which adds to the palatability of the ozonized water. It is claimed that all tastes and odors are removed by this process while mineral elements essential to health remain, for they do not oxidize.

There are a great many cities whose water supplies are chlorinated and it is claimed that the use of this ozone water purifier will eliminate the odor and taste of chlorin from the water the same as it

New Design of Ozone Water Purifier for the Home, Office and Factory. The Ozonizer Connects With Any Lamp Receptacle. The Purifier Has a Capacity of Over 2,000 Gallons Per Day.

eliminates other objectionable odors and tastes.

As an amelioration of filtered water, or as a substitute for filtered or distilled water, it is claimed the process of ozonization stands by itself; it has no equal in efficiency; the removal of disease germs is absolute; the water resulting from such process is as perfect as one can wish, being bright and sparkling. Each of the water purifiers has a purifying capacity of over 2,000 gallons a day, and, therefore, any user is entirely independent of the condition of the water at the municipal plant in his city.

THE MAKING OF A MATCH.

Thorpe gives the following proportions for match head and for striking surface:

Head composition: Potassium chlorat, 5 parts; potassium bichromat, 2 parts; glass powder, 3 parts; gum, 2 parts. Rubbing surface: Antimony trisulfid, 5 parts; red phosphorus, 3 parts; manganese dioxid, 1½ parts; glue, 4 parts.

Tungsten is now used as an electric battery element.

Electrical goods of American manufacture are extensively sold in Porto Rico.

www.americanradiohistory.com

WHAT IS A "KILOWATT" AND "KILOWATT-HOUR".

By Frank Szabo.

THERE seems to be quite a wrong conception of the terms *kilowatt* and *kilowatt-hour*. Quite frequently one hears expressions such as "10 kilowatts per hour", but such an expression does not mean anything.

What is a kilowatt? Kilowatt is a term for power or rate of work. According to Kent and other authorities, one kilowatt is equivalent to the evaporation of 3.52 lbs. of water *per hour* from and at 212 deg. F., or 3,415 heat-units *per hour*. In this definition, *per hour* is a necessary part of it, without which the definition is incomplete.

If it takes approximately 3 lbs. of burning coal to evaporate 3.52 lbs. of water from and at 212 deg. F., then one kilowatt represents the consumption of *3 lbs. of coal per hour*, and not simply the consumption of 3 lbs. of coal. If we extend the evaporation of 3.52 lbs. of water from and at 212 deg. F. by a consumption of 3 lbs. of coal uniformly over a period of two hours, we do not have the equivalent of one kilowatt, but one-half, or ½ kilowatt, because during one hour only one-half of 3.52 lbs. = 1.76 lbs. of water have been evaporated with a consumption of one-half of 3 lbs. = 1.5 lbs. coal. Also, if we did the above performance in 30 minutes, or one-half hour, we would not have the equivalent of one kilowatt, but two kilowatts, because at the same rate we would, during one hour, evaporate 2 x 3.52 lbs. = 7.04 lbs. of water with a consumption of 2 x 3 = 6 lbs. of coal. Hence, *one kilowatt represents the consumption of 3 lbs. of coal per hour.*

Of course the quantity of 3 lbs. of coal in the above explanation is not fixt; it may take slightly more or less than 3 lbs. per hour for one kilowatt, depending on the heat value of the coal and the efficiency of the steam and current generating units, but 3 lbs. is a fair average figure.

What is a kilowatt-hour? According to Kent, it is the evaporation of 3.52 lbs. of water from and at 212 deg. F., or 3,415 heat units. In this definition, *per hour* is left out because no matter how fast or how slow the water evaporates, the actual work done in evaporating 3.52 lbs. of water from and at 212 deg. F. is equivalent to *one kilowatt-hour*. In other words, one kilowatt-hour is the equivalent of the rate of one kilowatt for a period of one hour. The rate of ½ kilowatt for a period of 2 hours is also equivalent to one kilowatt-hour. Hence:

$$\text{Kilowatts} = \frac{\text{Kilowatt-hours}}{\text{No. of hours}}$$

and kilowatt-hours = kilowatts x No. of hours.

Referring to the operation of electric cars, we cannot correctly say they require *four kilowatts per car mile;* we must say *four kilowatt-hours per car mile*, because the speed of the train has to be considered. Suppose we introduce a watt-meter and a watt-hour-meter into the circuit. The watt meter will indicate the *rate* of power consumed in kilowatts, whereas the watt-hour-meter sums up all the kilowatt-hours consumed during the run. At uniform speed of the car the watt-meter pointer will remain approximately steady in one position, but the watt-hour-meter will continue increasing the reading at a constant rate. If the watt-hour-meter at the end of ten miles' run at constant speed shows a reading of 40 kilowatt-hours, and it took one hour to make the run of ten miles, then the watt-meter showed a constant reading of 40 kilowatts. But if the run of 10 miles is made in say one-half hour, the reading of the watt-hour-meter will be approximately the same—40 kilowatt-hours (neglecting the difference in efficiency of the unit at different loads)—but the watt-meter

(*Continued on page 700*)

ELECTRICITY

Taught By A Practical Man *and in Your Home!*

I am teaching electricity and electrical drafting to many men, young and old, and trust you will become sufficiently interested after reading this advertisement, that you will send for my catalog which tells what I am endeavoring to do and also places before you the simple way in which the instruction work is handled. The catalog is written in a very plain manner, much in the same style as my lessons are written, and tells you exactly what you get and what the course can do for you. My catalog, as well as my advertisements, is written in a very careful, conservative manner so there is no possibility of you expecting something you will not get.

The Purpose of the Course of Study

I have been designing courses in electrical instruction and teaching electricity, off and on during the past 17 years, and during that time I have had an unusual opportunity to make a special study of the teaching business, from the standpoint of a practical man. This course of my own is designed with a view of reaching those who do not have a lot of time and money to devote to study work, and to give them as thorough a knowledge as possible of electricity, in the shortest possible time. The instruction is given like you were working on various jobs and I was the boss telling you what to do and how to do it, and giving the explanation necessary for the understanding of the theory covered by the subject under discussion. There are many conditions which seldom occur in the every day run of electrical experience, and these conditions I lay particular stress on. This part of the instruction makes the course particularly attractive and valuable to those already engaged in active electrical work.

It Is Up To You

The instruction work is laid out and given in a way easily understood. It is not a cut and dried book plan, but the lessons are prepared especially for the purpose for which they are used and additional instruction is given to the individual student, with a view of meeting his particular needs. I have the information to give and I believe the ability to impart it to others, a fact which is in a way proven by other institutions which have made use of my services in the design and perfecting of instruction courses. To understand this work, IT IS UP TO YOU to stick with me and I will surely stick with you till you understand any part of the work you have gone over.

Practical Men Take My Course and Recommend it to Others

Sixty percent of my students are actively engaged in electrical work and find the instruction I give well suited to their needs. Several of these men have had their fellow workers take the course also and they are taking the instruction together, making a class-room proposition of it and the results are in every way satisfactory to all concerned. One of these classes was started by a Chief Electrician, one of my students in Glen White, W. Va., who now has practically all the men under him taking my course. I believe the fact that these men who understand electrical work approve of my course to this extent is one of the strongest endorsements I could get.

FIFTY FIFTY

I work absolutely on a 50-50 basis with my students. You pay me the comparatively low price I ask, and I give you the instruction and other help as is stated in my catalog. No student is permitted to pay cash for his entire course on starting, the course being paid for in small monthly payments as you go along. Students have the privilege of discontinuing the work if they should find that it was not just what they were after, and their payments stop at the same time. This is my way of doing business and I would not want your money when I was not giving you the instruction.

Apparatus, Instruments, Material, Etc.

Certain electrical apparatus, instruments, material, charts, drafting implements, etc., as detailed in the catalog, are included in the course and are a part of the regular instruction for which there is no extra charge as it is covered by the regular monthly payments.

FILL OUT COUPON FOR ONE OF MY CATALOGS WHICH GIVES FULL INFORMATION.

LEARN WIRELESS IN TEN WEEKS
Right In Your Own Home

Reproduced from the Washington Times, January 31, 1919—

SAYS RADIO WILL SOON SCRAP WIRES

"Scrap.

"That's all the telegraph and telephone poles, wires and instruments will amount to in a year if the program now being made in wireless communication continues."

Congressman Steenerson of Minnesota, ranking Republican member of the House Post-office Committee, made this prediction today. Wireless communication will have become so general by the end of the year 1919, Steenerson said that few persons will give much concern about whether the Government or private interests control the country's telegraph and telephone lines.

Limitation of Government control of these lines until the end of the present calendar year will have been forgotten, Steenerson added. If wireless telegraphic and telephonic communication is to continue along the present general lines

DECLINES TO COMMENT

Steenerson declined to comment upon the report that most of the telegraph and telephone companies would be glad to turn over their properties—which they now estimate to be worth about a billion dollars—to the Government, if they would be permitted to invest their capital in wireless communication.

"Such telephone and telegraph property will not be worth half as much as it is quoted at today, after wireless communication has demonstrated its usefulness and value," Steenerson continued.

This shows what big men think of the future of Wireless

The Age of Wireless Is Here

The experimental stage has passed. Wireless now equals in importance telegraphy, and telephony. It has assumed its place among the great commercial industries of the earth. So rapid has been the development and growth of wireless in recent years that there has been left in its wake a tremendous shortage of operators. Actually thousands upon thousands will be needed for permanent "peace time" positions offering wonderful opportunities for advancement:

No Previous Experience Necessary

You do not need any previous training or experience in order to become a successful Wireless Expert. By our practical ten weeks' Home Study Course you can quickly qualify for a good position at big pay. Many of our students have secured positions before completing the course.

Get Your Instruction From the Nation's Capital

Our Course Is Endorsed by Officials of the U. S. Government

The National Radio Institute, headed by authorities who have been closely allied with government training of students, has perfected an easily mastered course in wireless telegraphy whereby students are taught completely in ten weeks, either here in Washington at our large residence school or at home, by mail. Many of our students are ready to take up actual wireless work in much less time. The course is founded on actual practice, hence the rapid progress of the student.

Pay As You Go Along With Your Lessons

Our plans of payment bring a wireless education within the reach of anyone who desires to learn. A small payment down and small payments twice a month enable you to earn the cost of your tuition while actually learning to be a wireless operator.

Earn Up to $200 Per Month

In the short period of ten weeks we can make of you a wireless operator, a man with a profession, independent, and not subject to the rise and fall of wages in the labor market. Salaries are as high as $200 per month. We give you this training at home, by mail, in your spare time. It is not necessary for you to lose any time from your work to take the course. Then when you have received your diploma we help find you a good position.

Free Instruments to Every Student

In addition to text books, lessons and personal instruction, we send you a Home Practice Set consisting of a standard sending key and buzzer, and a Universal automatic wireless transmitting and receiving set. These instruments are free to every student. No other school can offer you what we do.

Wireless News Notes

The U. S. Shipping Board has recently announced an increase of nearly 30% in the pay of Merchant Marine Wireless Operators.

Nicola Tesla, world famous inventor, has recently perfected his Wireless Light, one of the wonders of the age.

Another new invention has been perfected whereby wireless messages may now be sent underground.

Due to the recent perfecting of the Wireless Telephone, we expect to soon be able to communicate with our Home Study students by wireless.

TRANSMISSION OF LIGHT THRU WATER.

The comparative transmission of light thru varying depths of water is a problem that science until recently knew but little

Showing Decrease In Transmission of Light Thru Water for Different Depths. A Problem Which All Submarine Inventors Are Interested In.

about. Now, thanks to Mr. S. L. E. Rose, of the General Electric Company's illuminating engineering laboratories, who describes his findings in the *General Electric Review*. Photometric readings were taken every six inches thruout the available range of 5½ feet of water in the cylindrical tank in which the tests were conducted. The water used was Schenectady city water, which is clear artesian well water. Sea water would transmit much less light owing to the apparent blue or greenish tint it possesses which tints bespeak a fairly considerable amount of suspended matter and consequently increased opacity.

The accompanying graphic curve shows vividly the relative transmission of light from a Mazda lamp, fitted with waterproof connections. A table of constants is given in the article, together with a formula for computing the illumination intensity for different depths of water when the initial intensity is known. The present graph shows, however, just how rapidly the illumination falls off in water for any given initial illumination. The particularly interesting feature of the results from a practical standpoint is the very considerable cut-off of light produced by a substance apparently so transparent, amounting for a single foot (0.05 m.) of water to 27.5 per cent. On this basis the transmission through 50 ft. (15.2 m.) of water would be only about one part in 10,000,000 of the incident light.

The rapid decrease in the transmission factor with increased light travel in water coincides with the well-known facts that, for a so-called transparent medium, the ocean permits the penetration of daylight to but a surprisingly short distance below its surface and that fish native to the depths are blind or carry their own illuminants.

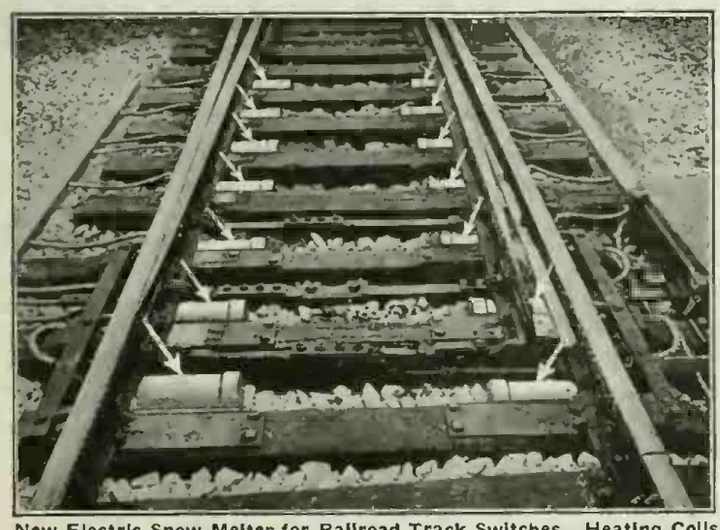
HAMMOND RADIO CONTROLLED BOAT SUCCESSFUL.

Army and navy experts have reported the device of John Hays Hammond, Jr., for radio control of surface craft to be sent laden with explosives against enemy ships, a success, and predict similar results with submerged craft.

Secretary Baker wrote the House appropriation committee recently that the joint army and navy board was "convinced of the practicability of the control" of the surface craft, and added that there had also been demonstrations of the possibility of the control to a craft, completely submerged, except for an air in-take pipe.

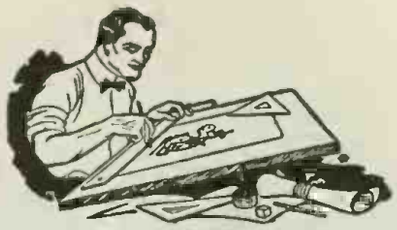
Before finally deciding on the purchase of the patents for $750,000 the board desires further experiment with the submerged craft.

Construction of the submerged craft, which will be about 80 feet long by 7 feet in diameter, will take two years, according to Mr. Hammond, who told the committee, he had spent ten years and $400,000 on his invention.



"The board considered the ability of the enemy to interfere with the control of the vessel by radio energy. Mr. Hammond's claims are that no interference can be had with the craft outside a radius of 100 to 150 yards from the source of the energy; that is, from the radio plant of a battleship, for example."

Major-General F. W. Coe said he had run the craft "all around vessels coming into the harbor at will." Mr. Hammond said an aviator after four hours' training on control, was able from a height of 9,000 feet and a distance of six or seven miles to exercise absolute control over the high-speed boat.



ELECTRIC SNOW MELTER FOR TRACK SWITCHES.

The electric snow melting device for track switches here illustrated is purely and simply an electric heater enclosed in a 3½ inch wrought iron pipe, 20 inches long. These heaters are placed between the ties, just under the rail. They are wired from a circuit as the amount and character of the supply current makes necessary, and a switch is placed in this wiring at some convenient point clear of the track. The current can be turned on as the snow storm starts by an employee as easily as an electric light. The heat generated does the rest.

The temperature in the heater rises about 100 degrees Centigrade in the first half hour and by the end of an hour is about 135 degrees Centigrade above the outside temperature. This heat is not enough to set fire to anything but is sufficient to melt the snow.

As a Mechanical Draftsman

Thousands of Men Wanted

You can learn Mechanical Drawing at home in your spare time through our practical Home Study Course and qualify for Big Pay. We have placed hundreds of our students in good paying positions. Government departments and private concerns are continually calling upon us for our graduates.

Become a Chief Draftsman

and get to the very top in this well-established and rapidly growing profession. The training given by the Columbia School of Drafting will give you just the knowledge you need to make good as a Chief Draftsman. No previous training is necessary. You can begin our course now and make rapid progress from the start under the Personal Instruction of the President of the School, Mr. Claflin, by mail. His carefully prepared lessons and personal letters of advice make each step easy and interesting.

Draftsmen Now Getting $35 to $100 a Week

with big chances for better pay as the demand grows. All big engineering, construction and manufacturing projects must first go through the drafting room before the workmen can commence. All such enterprises depend upon large numbers of draftsmen. Salaries are advancing steadily.

Drawing Outfit Free with Our Course

As soon as you enroll you will be sent our drawing outfit for your own use throughout the course. This entire outfit will be yours to keep. You are not obliged to return it after completing the course.

Not Only a Correspondence School

The Columbia School of Drafting is probably the largest residence school in the country specializing in the training of professional Draftsmen. Our Home Study Courses are an extension of the same instruction as given locally.

Illustrated Catalog FREE

Simply fill in the coupon below, return it to us and we will send you free a copy of our illustrated catalog which tells all about our practical Home Study Course and how you may secure our instructions at once on easy terms so as to quickly qualify for one of the big positions open.

Send This Coupon Today.

COLUMBIA SCHOOL OF DRAFTING
Dept. 982, 14th and T Sts., Washington, D. C.

Without obligation to me, please send me your Illustrated Catalog and tell how I may secure your practical training in Drafting and your help in securing a position as Draftsman.

110-V. TRANSFORMERS

8 Volt Secondary

Consumes so little current will not move ordinary meter.

$1.00 Postpaid

Only $1.00

No. 10 gives 3 currents — 8, 12 and 18 volts secondary. Ideal for experimental work. A standard transformer, guaranteed. Complete with plug, $2.00 postpaid. Order from this ad.

NATIONAL TRANSFORMER CO.,
Dept. 13, 3124 No. California Ave., Chicago

ELECTRICAL ENGINEERING IN ONE YEAR

training again open to civilians. Over 3000 men trained for electrical industries in experience of more than a quarter of a century. For men of ambition and limited time. Condensed course in Electrical Engineering enables graduates to secure good positions and promotions. Theoretical and Practical Electricity. Mathematics. Steam and Gas Engines. Mechanical Drawing. Students construct dynamos, install wiring and test electrical machinery. Course with diplomas complete.

Thoroughly equipped fireproof dormitories, dining hall, laboratories, shops. Write for catalog. 27th year opens October 1, 1919.

BLISS ELECTRICAL SCHOOL
260 Takoma Avenue, Washington, D. C.

WHAT IS A "KILOWATT" AND "KILOWATT-HOUR?"

(*Continued from page 897*)

will give a constant reading of 80 kilowatts; in other words, for a speed twice as great the watt-meter will show a constant reading twice as high, whereas the watt-hour-meter reading will be the same for the *same distance traveled.*

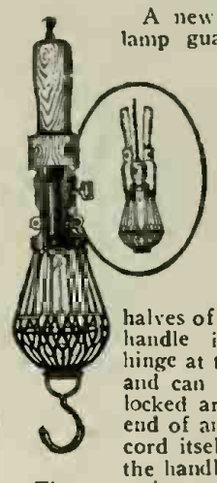
Applying the formula to this example for a speed of 10 miles per hour and a power consumption of 40 kilowatt-hours, we get

$$\text{Kilowatts} = \frac{40}{1} = 40$$

Making the same run in one-half hour we get

$$\text{Kilowatts} = \frac{40}{\frac{1}{2}} = 80$$

Dividing the total power consumed by one car in kilowatt-hours by the distance in miles, we get the power consumption in *kilowatt-hours per car mile.*



Applying the above terms to electric light, a 40-watt electric light is one that consumes electric power at the rate of 40 watts or 40 watt-hours per hour. A circuit having, say, twenty 40-watt lights in parallel will then consume electric power at the rate of $20 \times 40 = 800$ watts or 800 watt-hours per hour, or 40 watt-hours per lamp-hour. If an electric power station charges you ten cents per kilowatt-hour you can burn one 40-watt lamp

$$\frac{1{,}000}{40} = 25 \text{ hours, or twenty 40-watt lamps}$$

$$\frac{1{,}000}{20 \times 40} = 1\tfrac{1}{4} \text{ hours, for ten cents, since}$$

both conditions represent *one kilowatt-hour.*

SOMETHING NEW IN LAMP GUARDS.

A new departure in portable lamp guards is shown in the illustration of a split handle which can be quickly attached to a special expanded steel lamp guard supplied by the same concern.

This *portable* successfully fills a demand for a substantial handle guard which does not need to be wired. The halves of the guard including the handle itself, open from the hinge at the bottom of the guard and can instantly be closed and locked around the socket at the end of any extension cord. The cord itself runs thru grooves in the handle.

The convenience of this new product will be appreciated by the motorist in his garage as well as in every factory, mill or warehouse, because it permits light to be safely carried to dark corners, in stock bins, engine pits, etc. Fire danger is avoided and lamp users will readily see the advantage and economy, as the modest cost of the guard is quickly repaid thru prevention of lamp breakage.

ANOTHER "USELESS" PATENT.

A Chicago woman has patented a shoe with an electric battery in the heel to supply a mild current to a wearer's ankle as a tonic. Another "useless patnt!"

THE PHOTOELECTRIC SENSITIVITY OF VARIOUS SUBSTANCES.

SOME time ago an examination was made of various substances to determine their electrical sensitivity to light; and in view of the fact that some of the results obtained are at variance with the measurements made by Case, it seems desirable to publish a summary of these observations, which were made at the Bureau of Standards.

Two of the herein described substances were examined for change in electrical conductivity caused by the action of light upon them, and all of them were examined for *photoelectrical activity* when they were charged to a negative potential in an evacuated bulb and exposed to light, reports Messrs. Coblentz and Emerson in the *Journal of the Washington Academy of Sciences.*

When the substances were examined for an increase in electrical conductivity, a potential of 2 to 6 volts was connected thru a resistance of zero to 1,000,000 ohms into a circuit containing a d'Arsonval galvanometer and the substance under investigation. In most cases the substances were slightly conducting when not exposed to light, so that the *dark current* had to be annulled by joining a counter e.m.f. thru a resistance of 10,000 ohms to the terminals of the galvanometer. This counter e.m.f. was obtained by shunting across a resistance of 100 ohms which was in series with a cell of 2 volts and a variable resistance of zero to 70,000 ohms.

The source of light, when not otherwise

MAGNETIC RECTIFIER
Patented April 18, 1916

COLD WEATHER WON'T BOTHER YOUR STARTER
If you keep your battery charged up with an

F-F BATTERY BOOSTER

CONNECT to any lamp socket without removing battery from car or breaking any electrical connections. Changes alternating to direct charging current, and will completely fill your battery over night.

The Private Garage types cost only $24.00 and come complete with long cord and plug to fit any lamp socket, ammeter, which tells what current is flowing into the battery and charging wires fitted with clips, to snap on the battery terminals.

Thousands in use giving satisfaction.

CORE WIRE

We have been fortunate in securing thru auction several tons of guaranteed pure, double annealed Norway Iron Core Wire and are selling this wire to "Experimenter" readers

AT PRE-WAR PRICES 20cts LB.

This wire is just the thing for spark coils, transformers, etc., and it is, of course, a very much more superior product than the usual iron wire. We absolutely guarantee the quality.

If you ever thought of building a spark coil, transformer, or similar apparatus, now is the chance to get the right material for it. As far as we know this is the only lot of Iron Norway Core Wire in the hands of any dealer at the present time, and none can be gotten until after the war.

We have only two sizes left:

26 INCHES 36 INCHES

Thickness about No. 21 B and S

If either of these sizes should be too long we advise cutting the wire down yourself by means of shears. It will pay you to do so as real Norway Iron Wire, sold by a few dealers last year, brought from 40c to 50c a pound. American core wire now sells for from 30c upwards per pound.

As long as the supply lasts we offer this wire as described above to our customers at the very low price of 20c a pound. Order at once.

ELECTRO IMPORTING CO., 231 Fulton St., N. Y. C.

www.americanradiohistory.com

specified, was a 16-c.p. carbon incandescent lamp, placed at a distance of 10 cm. from the substance under investigation. One disappointing feature of this investigation is that no substance was found which is comparable in sensitivity with the *potassium photoelectric cell* and with the *selenium cell.*

Gallium. This metal was solid, thus differing from the impure material, which is a liquid.

The results obtained proved disappointing, this metal being quite insensitive to light. When the cell was exposed to daylight the photoelectric current produced a deflection of only 4 to 5 mm., whereas similarly exposing a *potassium photoelectric cell* the photoelectric current was sufficient to give a deflection beyond the range of the scale.

Silver Sulfide. The sample examined was a thin flexible strip, 6 by 10 mm. in area. In one test the silver sulfide formed the negative electrode of a photoelectric cell (evacuated glass bulb about 5 cm. diameter with a ring of platinum wire for the anode). It was connected thru an iron-clad Thompson galvanometer to a battery of 340 volts. When exposed to daylight a deflection of perhaps 1 to 2 mm. was observed, but no deflection resulted from exposure to the standard carbon lamp.

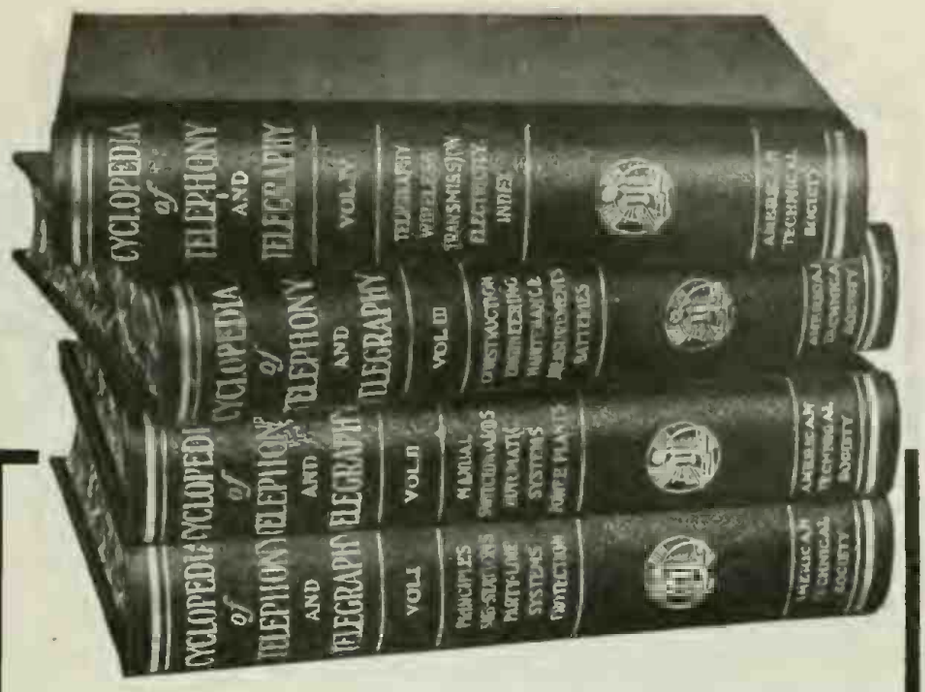
Selenium. A crystal of selenium, prepared by Dr. F. C. Brown and having a receiving surface of less than one sq. mm., when exposed to the standard lamp gave a deflection of more than 50 cm., which shows its *great sensitivity* as compared with other substances.

The mounting of the selenium crystal consisted of metal electrodes between which the crystal was held by compression. When operated as a photophone, by connecting the selenium crystal with an Audion amplifier, a loud musical note was obtained.

Tellurium. This metal is said to change in resistance when exposed to light. The present tests were made upon a mirror of tellurium deposited upon a glass plate by cathode disintegration. Suitable terminals were attached to a sample about 4 by 50 mm. *No change in conductivity* was observed when it was exposed to light.

Boleite. The sample of boleite [3Pb Cl (OH).Cu Cl (OH) + Ag Cl], from Boleo, Mexico, examined was a single rectangular crystal 3 by 3 by 1.5 mm. It was held by compression between copper electrodes. *No change in conductivity* was observed when the crystal was exposed to daylight or to the standard incandescent lamp.

Stibnite. The size of one sample examined was 4 by 7 by 0.5 mm. Terminals were attached to it by heating a copper wire to incandescence in a gas flame and bringing it in contact with the plate of stibnite.



The standard carbon lamp caused a deflection of 5 cm. Stibnite may be considered as sensitive as *boulangerite*, to be mentioned presently, but the deflection drifted, due to the decrease in resistance with time already noticed by other observers.

Boulangerite. The specimen of boulangerite (3PbS. Sb_2S_3, Irkutsk, Siberia), investigated was obtained from the Smithsonian collection. Several samples were examined. In one sample, 4 by 7 by 0.8 mm., the electrodes consisted of copper wires melted into the material as just described. The radiation from the standard lamp gave a deflection of 10 to 20 cm.

Another sample, 1 by 1.2 by 2 mm., held by compression between two heavy electrodes of copper, when exposed to the standard incandescent lamp produced a deflection of 2 to 3 cm., which is comparable with the preceding when one considers the size of the exposed surfaces.

Altho this substance seems fairly sensitive, it did not appear to be sufficiently so to justify an investigation of its spectral sensitivity with a view of using this mineral as a selective radiometer.

Jamesonite. ($2PbS.Sb_2S_3$; Smithsonian

Telegraph and Telephone Books Sent to Experimentors for a Whole Week FREE

Absolutely free to use for seven days—no strings of any kind to this offer. Every reader of Electrical Experimenter can have a set of these great, instructive and intensely interesting books telling everything that the greatest experts in the business know about telephony and telegraphy. The coupon brings all four volumes right to your door. If they don't please you in every way, we stand the expense of shipping them back. See the list of things the books explain and our *free trial* offer below.

Will Make You An Expert

This Library of Telephony and Telegraphy will fit you to hold the biggest kind of job in this interesting and well-paying field. The 4 big books with 1,728 pages and 2,000 pictures, plates, diagrams, etc., bound in genuine leather, regular library style, explain everything you need to know.

Part of What They Contain Electric Telegraph—Wireless Telegraphy—Wireless Telephony — Elements of Electricity — Line Construction—Engineering and Maintenance—Electrical Measurements — Switchboards — Automatic Systems —Power Plants and Buildings—Special Service Features — Telegraph and Railway Work — Substation Equipment—Party Line Systems—Generators—Train Dispatching—Storage Batteries—Coils—Tests. Altogether a thousand different subjects are covered in detail.

Consulting SERVICE FREE With every set of the Cyclopedia of Telephony and Telegraphy we will give without any charge whatever a one year membership in the American Technical Society enabling you to consult our engineers and experts on any telephone, telegraph or wireless problem you want solved for one year. This membership usually sells for $12.00. It is yours free with the books.

DON'T SEND MONEY

Don't send one cent with your free trial request. The coupon is all you need to get the books. Just fill out all three lines and mail it to us. We will ship the books to either your home or shop by express collect and you can use them as if they were your own for a whole week. Then if you want to send them back do it. It's all right with us and we will pay the expense of shipping them back ourselves. If you want to keep the books send us only $2.00. You can send the balance of our special $12.80 price the same way—$2.00 each month.

We reserve the right to withdraw this price at any time. In fact we cannot maintain it after the present edition is sold. Act now while the low price holds good.

FREE TO THE RUPTURED

DON'T WEAR A TRUSS

FREE TRIAL

Do Away With Steel and Rubber Bands That Chafe and Pinch

You know by your own experience that the truss is a mere makeshift—a false prop against a collapsing wall—and that it is undermining your health. Why, then, continue to wear it? STUART'S PLAPAO-PADS are entirely different—being medicine applicators made self-adhesive purposely to prevent slipping and to hold the distended muscles securely in place. No straps, buckles or springs attached. No "digging in" or grinding pressure. Soft as Velvet—Flexible—Easy to Apply—Inexpensive. Continuous day and night treatment at home. No delay from work. Hundreds of people, old and young, have gone before an officer qualified to acknowledge oaths, and swore that the PLAPAO-PADS cured their Ruptures—some of them most aggravated cases—and of long standing.

Send Today For FREE PLAPAO--No Charge for it--Now or Ever

Simply write your name and address below. Send this advertisement for absolutely FREE TRIAL PLAPAO and 48-page Book on Rupture. No charge for it—now or ever. Nothing to be returned. "Be wise today 'tis madness to defer." Address, PLAPAO CO., Block 844, St. Louis, Mo.

AMERICAN SHARPENING MACHINE CO. (Inc.), Dept E E, 184 W. Washington St., CHICAGO

collection, from Cornwall, England.) The sample examined (size 2 by 7 by 1 mm.) had the copper wire terminals attached by fusing the incandescent wire into the material. The standard lamp gave a deflection of only 1 to 2 cm., which seems to indicate that this material is not so light-sensitive as is boulangerite.

Mixtures of galena and stibnite in various proportions were melted in a crucible and poured upon a plate of metal. Several samples, 5 by 10 by 0.5 mm., were examined, but none of them gave any indication of light-sensitiveness (change in resistance) when exposed to daylight or to the standard incandescent lamp.

Bismuthinite. Bismuthinite, Bi_2S_3, was obtained from the Smithsonian collection from Jefferson County, Montana. This is the most interesting substance examined, in view of the diverse results obtained and the explanation offered therefor.

The sample of bismuthinite examined consisted of a non-homogeneous mass of acicular crystals, which was easily crushed into numerous fine needle-like crystals. The first sample examined was a small mass of crystals (size 1 by 1 by 0.7 mm.) held by compression between two heavy electrodes of copper. When the crystal was exposed to the standard carbon lamp *no change in conductivity* could be detected with certainty.

A second sample, 3 by 6 by 1 mm., had the copper wire terminals attached by fusion, as already described. The e.m.f's applied were the same as for the preceding sample. When exposed to the standard lamp no change in conductivity was observed. These results being contradictory to those published by Case, who used a three stage Audion amplifier to detect the change in conductivity of the crystals, the foregoing experiments were repeated in the manner described by him. For this purpose the light from an acetylene flame shining thru a slit 2 by 10 mm. was focused upon the crystal by means of a triple achromatic lens, 6 cm. in diameter and 18 cm. focal length. The light was interrupted by means of a sectored disk having 15 openings and operated by means of an electric motor, the speed of which could be varied. The usual speed gave 240 interruptions per second. The crystal was connected to a three stage Audion amplifier and telephone receiver. A crystal of selenium or a selenium cell produced a loud note, but the samples of boulangerite and jamesonite, which by previous tests were light-sensitive, did not give a musical sound in the telephone.

The sample of bismuthinite with electrodes sealed on produced no audible note when exposed to light.

At least a dozen samples of bismuthinite held by compression between heavy copper electrodes were examined in connection with the amplifier. Of this number only two samples appeared to be light-sensitive. One sample produced only a faint sound in the telephone receiver. The second sample produced a loud note in the telephone. The sound was the loudest when the crystal was exposed along the line of contact with the copper electrode. Covering the crystal with red glass did not reduce the loudness of the note very much, indicating that the effect is due to heating of the material. Unfortunately, this crystal was crushed while under investigation. Prolonged tests on other samples gave negative results as regards the production of sound.

In view of the fact that the tests made with a sensitive galvanometer failed to show an increase in conductivity when bismuthinite was exposed to light, it appears that the change in conductivity which was observed when a certain specimen was exposed to intermittent flashes of light (photophone or, rather, radiophone) is

www.americanradiohistory.com

the result of a *thermal change* within the crystal, or perhaps a change in the *contact resistance* at the electrodes. In this connection the following experiments on thin strips of metals are of interest.

Platinum and Gold. In conclusion it is of interest to record the results obtained when using thin blackened strips of platinum and of gold-leaf as radiophones, by connecting them thru a battery to an amplifier.

These blackened strips were warmed intermittently by exposing them thru a rotating sectored disk to the acetylene flame, as already described.

When a sensitive platinum bolometer receiver was used as a radiophone, the sound produced in the telephone was not very audible. This no doubt was due to the great heat capacity of the material which prevented the rapid alternations in resistance and hence in electric current, from being of sufficient magnitude to affect the telephone receiver.

Using a lightly smoked strip (6 by 2.5 mm.) of gold-leaf, the ends of which were clamped between thin (0.02 mm.) strips of tin, the sound produced in the telephone receiver was as loud as was observed in the photophone made of selenium.

This device was mounted in a glass bulb which could be evacuated. As was to be expected, there was no marked difference in the intensity of the sound produced when operated in air and in a vacuum.

In the gold-leaf radiophone as used, the limit of audibility was attained for a light (radiant power) intensity of 4.8×10^{-5} watts. Using a larger receiver and amplifier and a larger current (which was 0.2 amp. in the present tests) thru the receiver, the sensitivity could be greatly increased.

MENTAL TELEPATHY—A SIMPLE CONCEPTION OF PSYCHICAL ACTIVITY.

By Dr. Charles H. Merlitz

IN the September issue of the ELECTRICAL EXPERIMENTER there appeared an extremely interesting article by Dr. A. Abrams on *Thought Transference and Other Phenomena.* Altho he gave many interesting experiments he did not show the relationship of this theory to the modern physical theories. It is the author's intention in the present article to present an explanation for this remarkable phenomena.

We know very little in regard to the functioning of the human mind. We have practically no insight into the mechanism of thought and memory. We do know, however, that the brain in functioning requires nourishment. Thus it follows that any operation of the brain is accompanied by the absorption of a certain amount of energy. However, *contrary* to ordinary laws, in storing a thought and in subsequently recalling it, *energy is absorbed.* These two processes are the opposite of each other, and it would naturally be supposed that in remembering energy would be dissipated.

To commit a thought to memory we repeat it several times, each successive repetition requires the expenditure of a certain amount of energy. Thus we may say that the energy expended after a number of repetitions equals:

$1^2 + 1^2 + 1^2 + 1^2 - - - - - -$ n times

Now when we remember it the process is the reverse, which gives us $(-1)^2$ which would equal 1^2, which means the *addition of energy.* Thus the act of remembering a fact more firmly implants it in the mind.

We may easily assume that there is a certain practical limit to the amount of effect that can he produced. This limit might be called the *saturation* of the brain. It would he reasonable to suppose from this that for each repetition or act of remembering the amount of energy stored is less than that of the preceding one, decreasing in geo-

VIOLET RAYS for Health Strength and Beauty

You can TREAT YOURSELF at home with the wonderful Violet Ray, most effective health-restoring agent known to science. At practically no cost, the great benefits of famous Violet Ray Treatment heretofore only procurable at big expense from physicians and beauty specialists, now secured in your own home. Look over the list of treatments on the coupon below. Send for particulars.

RENULIFE VIOLET RAY
High Frequency Generators

USE AT HOME

How Violet Ray Benefits

Electricity from your light socket is transformed into health and beauty-giving Violet Ray—powerfully effective, yet gentle, soothing, perfectly safe. Voltage is raised from lighting current, giving tremendous penetrative force. The irresistible, revitalizing powers of Renulife Violet Ray are carried at once to every nerve cell of body. Blood is enriched and purified by a flood of oxygen, functions restored to normal—extra supply of fresh blood quickly brought to area treated, removing congestion and supplying nourishment; combines the benefits of electricity, vibration, exercise, stimulation and oxidation.

Painless Electricity

Science has modified electricity that the weakest may stand its force without fear or pain. Violet Ray high frequency has no comparison with old, crude, electrical batteries and shocking current. Every jar and shock is removed. The effects are marvelously rapid. Relief can be given in one or more treatments. Often permanent improvement is accomplished in that time.

Offered on Liberal TRIAL PLAN
Learn the Wonderful Benefits by Actual Use.

To keep or restore your good looks and gain vitality, throw away medicine bottles—take this sensible scientific means. Every day's delay makes relief more difficult. Send for Booklet "Health via Violet Ray."

Men Wanted for Airplane INDUSTRY

Wonderful opportunities —great scope for advancement—and big pay—await you in the airplane industry. This does not mean actual flying, but in any and all of the various branches of the industry. It is the coming profession—the future means of transportation. U. S. Mail is already being carried by airplanes. Factories are springing up everywhere and trained men are in big demand.

Openings in Many Branches You can get into this profession while it is still in its infancy as a mechanic, engineer, repairman, instructor, inspector, builder, contractor, salesman or professional aviator. The minute you understand the science and mechanics of aviation you can step into a high-salaried position.

We Guarantee Our Training

We absolutely and unreservedly guarantee that our Home Training Course will enable you to qualify for a good position as soon as you graduate. The Course itself has been written by noted aeronautical engineers, and covers the entire fundamentals of practical aeronautics. Every lesson is written and illustrated so clearly that you cannot fail to understand it. **But see for yourself.** Take ten lessons. Then if you are not satisfied you are not out one cent. We guarantee satisfaction.

Prepare Now for a Big Future

Only by specialized instruction can you expect to succeed in aviation or in any line of business. Training alone will fit you for a big job—and NOW is the time to begin. Check and mail the coupon for Big Free Bulletin and Money-Back Guarantee.

metrical progression. Each repetition, however, is accompanied by the absorption of a certain amount of energy. Thus it follows that for each succeeding repetition there is a certain amount of surplus energy to be accounted for. It is this surplus energy that gives us an explanation for the process known as *Mental Telepathy*. Our question then resolves itself into the manner of transference or transmission of this energy.

Sir William Crookes has suggested that the transmission of this energy is effected by means of *ether waves* of *smaller magnitude* and *greater frequency* than those which constitute X-rays. These rays also possess the property of neither being reflected or refracted. Prof. Flournoy suggested that these waves are undulations starting from the nervous centers in the brain. The greatest objection to this theory of telepathy is that the intensity of the received impulses is not inversely proportional to the square of the distance, no perceptible diminution in the impulses being produced by distance. In actual experiments the intensity sometimes even increased with the distance. The explanation of this curious phenomena is extremely simple, however. Pocock has suggested that the sensibility and capacity of the brain for the reception of these transmitted impulses is extremely small, so small in fact that the receiver is saturated even at the greatest distance over which telepathy has been observed. The excess energy passes on—unable to produce any effect upon the already saturated brain. This explains why the intensity is not diminished by distance.

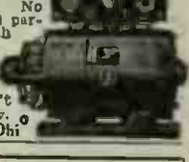
We may postulate then that Mental Telepathy is a case of *radiant energy*. These radiations emanating from the brain when the mind is concentrated, are therefore very penetrating and traverse great distances without perceptible decrease in intensity.

The reasoning which I have heretofore pursued has been from the purely theoretical standpoint. The fact that the brain actually radiates energy has been demonstrated by several scientists. Charpentier showed that the human body emits what he has called "N-rays." He found that the phosphorescence of certain substances is increased when they are brought into the vicinity of contracting muscles or one of the nervous centers of the cerebral cortex. He demonstrated this by the use of a simple piece of apparatus. A lead tube about two inches long covered at one end by a piece of paper or silk treated with phosphorescent calcium sulfate was employed. By placing this tube near nervous centers a marked increase in phosphorescence was observed. Di Brazza showed that when a phosphorescent, platino-cyanid of barium screen faintly illuminated by a distant X-ray tube was placed near certain portions of the head, that when the subject concentrated his will the luminosity of the screen was varied in relation to the subjects *psychical activity*. From this he concluded that the brain was the seat of active radiations. When the subject's attention is not concentrated no variation in the luminosity is noticeable. Di Brazza found that the activity was greatest around the temples, the eyes and behind the ears. This experiment may be repeated by exercising great care. It must be remembered, however, that the variations in luminosity are extremely small.

There have been many experimenters in this branch of science, many of whom have recorded remarkable instances of telepathy or *action at a distance*, as it is sometimes called. Professor Henry Sidgwick has collected a great number of instances in which hallucinations directly preceded death, and which he attributed to mental telepathy. Wessermann has recorded a singularly in-

The ANDERSON Steam Vulcanizers
We manufacture them—we own and teach you the Anderson Method of Vulcanizing—90% profit. And still you guarantee your work to outlast balance of the tire and collect full customary prices.
Ask us for literature and location of nearest Anderson State School. We urge you visit that city where you can see all other makes and learn their method, then visit the Anderson School there and learn our Method.
Go prepared to take 5 to 10 days' course of the ANDERSON METHOD. We guarantee to make a first-class vulcanizer out of you or refund your money. Our course will cost you $20 in either the day or night classes and any time thereafter you buy and pay us for a vulcanizer, your $20 will be refunded in cash. $235 and 5 to 10 days in Any Anderson State School of Vulcanizing will start you in this most profitable business. The Anderson Steam Vulcanizer Co., 23 Williams Bldg., Indianapolis, Indiana, U. S. A.
Please print your name. We receive many we can not make out.

Swing 4 in., 11 in. between centers, 17 in. total length. Shipping weight 13 lbs. Bed of lathe is machined. Workmanship first-class. Equipped with wood turning chuck. Can be fitted with 3 in. face plate and drill chuck as special equipment. Order one today. Price $6.00 cash with order. SYPHER MFG. CO., DEPT. C TOLEDO, OHIO



THE NEW MIDGET SLIDE RULE
has many exclusive features. It will add and subtract fractions and give decimal equivalents. It will also multiply, divide, add and subtract, solve problems involving any root or power (excepting—1) and will give Logarithms and the Sines, Tangents, Cosines and Cotangents of all angles. Made of metal. Size 3 1-4 inches. Send for free circulars. Price with complete instructions $1.00
Your money back if you are not satisfied.
GILSON SLIDE RULE CO., Niles, Mich

Says the Master Mechanic. The Greb Automatic Grip Puller is a One-Man Puller—Quick-acting, strong and simple in the extreme. May be locked in any desired position. A combination of two or three arms. Heavy Duty Size capacity 1" to 18"—Junior size capacity 1" to 7". Two sets of jaws furnished with each size.
Ten Days' Trial If your dealer or jobber does not have them we will send you one. Try it ten days. If not satisfactory, return to us and we will refund your money. We also make the GREB RIM PULL.
THE GREB CO., 230 State Street, BOSTON

Electricians Get up-to-date in HOUSE WIRING! Save TIME, MONEY, LABOR and MATERIAL by using our 98 GENUINE BLUE PRINT DRAWINGS, containing all the latest diagrams and connections known in house wiring—every diagram and connection up-to-the-minute as used by first class electricians for wiring BELLS, BURGLAR ALARMS, LIGHTS, ANNUNCIATORS, FIRE ALARMS and ELECTRIC GAS LIGHTING. These drawings are bound in the form of a flexible book (9 x 12) for convenience in using on the job. Send for them, and if they don't make you more efficient as a wireman and save you many times their cost as a contractor, return them and money will be refunded—you can't afford to be without them. ONE DOLLAR Postpaid. Send for circulars on other sets of drawings.

teresting incident. He wished to make the apparition of a young lady appear to a lieutenant living several miles away. At the time of the experiment a visitor happened to be with the lieutenant, who is said to have seen the apparition also. Many instances are recorded in which persons were hypnotized at some distance. All of these phenomena can be easily explained by the *brain wave* theory.

Besides the transference of thought, both sympathy and affection may be the outgrowth of these radiations from the brain. Whether our capacity for the reception of these impulses is increasing with the evolution of man, cannot be ascertained directly. It would seem probable, however, that with our increase in education and civilization that a conscious use of this *thought language* may be found. Who knows but that the man of the future may find a practical application for this radiation from the brain, and a higher and more delicately made creature may result who would effect mutual understanding by means of this marvelous and as yet but little understood *psychical activity.*

MY INVENTIONS

(*Continued from page* 865)

travel at a rate of about one thousand miles an hour, impracticable by rail. The reader will smile. The plan was difficult of execution, I will admit, but not nearly so bad as that of a well-known New York professor, who wanted to pump the air from the torrid to the temperate zones, entirely forgetful of the fact that the Lord had provided a gigantic machine for this very purpose.

Still another scheme, far more important and attractive, was to derive power from the rotational energy of terrestrial bodies. I had discovered that objects on the earth's surface, owing to the diurnal rotation of the globe, are carried by the same alternately in and against the direction of translatory movement. From this results a great change in momentum which could be utilized in the simplest imaginable manner to furnish motive effort in any habitable region of the world. I cannot find words to describe my disappointment when later I realized that I was in the predicament of Archimedes, who vainly sought for a fixt point in the universe.

At the termination of my vacation I was sent to the Polytechnic School in Gratz, Styria, which my father had chosen as one of the oldest and best reputed institutions. That was the moment I had eagerly awaited and I began my studies under good auspices and firmly resolved to succeed. My previous training was above the average, due to my father's teaching and opportunities afforded. I had acquired the knowledge of a number of languages and waded thru the books of several libraries, picking up information more or less useful. Then again, for the first time, I could choose my subjects as I liked, and free-hand drawing was to bother me no more. I had made up my mind to give my parents a surprise, and during the whole first year I regularly started my work at three o'clock in the morning and continued until eleven at night, no Sundays or holidays excepted. As most of my fellow-students took things easily, naturally enough I eclipsed all records. In the course of that year I past thru nine exams and the professors thought I deserved more than the highest qualifications. Armed with their flattering certificates, I went home for a short rest, expecting a triumph, and was mortified when my father made light of these hard-won honors. That almost killed my ambition; but later, after he had died, I was pained to find a package of letters which

(*Continued on page* 907)

Volume II 180 pages — Volume I 184 pages

both bound in red Athol-leather, gold title, good paper, handy size, 4½" x 7".

You Will Want Both Books

These handy reference books are of exceptional value to you, whether you are an apprentice or a highly skilled mechanic. Both books are edited by men prominent in the machinery field—men who know exactly what is most helpful to the beginner as well as the experienced man.

Volume II for Practical Machinists
Sequel to Volume I

180 pages of important technical data, tables relating to machine speeds, power transmission, drilling, turning and milling, materials, etc.

Volume I for Machinists' Apprentices
Now in 4th Edition

184 pages of material that shows "how to do it." Essential to the beginner, valuable to the experienced machinist. It deals with the layout and precise measurement of work.

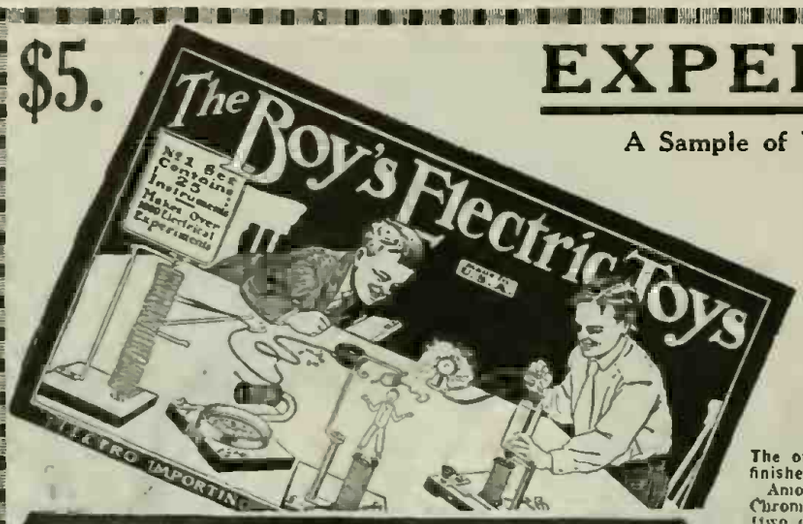
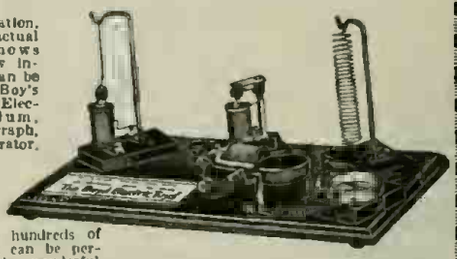
What 15c will bring You from the Nation's Capital



Washington, the home of the Pathfinder, is the nerve center of civilization; history is being made at this world capital. The Pathfinder's illustrated weekly review gives you a clear, impartial and correct diagnosis of public affairs during these strenuous, epoch-making days.



The little matter of 15c in stamps or coin will bring you the Pathfinder 13 weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation; a paper that prints all the news of the world and tells the truth and only the truth; now in its 26th year. This paper fills the bill without emptying the purse; it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send 15c to show that you might like such a paper, and we will send the Pathfinder on probation 13 weeks. The 15c does not repay us, but we are glad to invest in new friends. **The Pathfinder, Box 576, Washington, D. C.**

$5. EXPERIMENTERS!

A Sample of What You Can Do With This Outfit

This illustration, made from an actual photograph, shows only a very few instruments that can be made with the Boy's Electric Toys: Electric Pendulum, Electric Telegraph, Current Generator, Electric Dancing Spiral, Galvanometer, Space does not permit us to show the hundreds of experiments that can be performed with this wonderful outfit.

The outfit contains 114 separate pieces of material and 24 pieces of finished articles ready to use at once.

Among the finished material the following parts are included: Chromic salts for battery, lamp socket, bottle of mercury, core wire (two different lengths), a bottle of iron filings, three spools of wire, carbons, a quantity of machine screws, flexible cord, two wood bases, glass plate, paraffine paper, binding posts, screw-driver, etc., etc. The instruction book is so clear that anyone can make the apparatus without trouble, and besides a section of the instruction book is taken up with the fundamentals of electricity to acquaint the layman with all important facts in electricity in a simple manner.

We guarantee satisfaction.

The size over all of the outfit is 14x9x2¾. Shipping weight, 8 lbs. **No. EX2002 "The Boy's Electric Toys," outfit as described. $5.00**

IMMEDIATE SHIPMENTS

No. EX2002

THE BOY'S ELECTRIC TOYS" contains enough material TO MAKE AND COMPLETE OVER TWENTY-FIVE DIFFERENT ELECTRICAL APPARATUS without any other tools, except a screw-driver furnished with the outfit. The box contains the following complete instruments and apparatus which are already assembled:

Student's chromic plunge battery, compass-galvanometer, solenoid, telephone receiver, electric lamp. Enough various parts, wire, etc., are furnished to make the following apparatus:

Electromagnet, electric cannon, magnetic pictures, dancing spiral, electric hammer, galvanometer, voltmeter, hook for telephone receiver, condenser, sensitive microphone, short distance wireless telephone, test storage battery, shocking coil, complete telegraph set, electric riveting machine, electric buzzer, dancing fishes, singing telephone, mysterious dancing man, electric jumping jack, magnetic geometric figures, rheostat, erratic pendulum, electric butterfly, thermo electric motor, visual telegraph, etc., etc.

This does not by any means exhaust the list, but a great many more apparatus can be built actually and effectually.

With the instruction book which we furnish, one hundred experiments that can be made with this outfit are listed, nearly all of these being illustrated with superb illustrations. No other materials, goods or supplies are necessary to perform any of the one hundred experiments or to make any of the 25 apparatus. Everything can be constructed and accomplished by means of this outfit, two hands, and a screw-driver. (Continued in next column)

The "Electro" Radiotone
HIGH FREQUENCY SILENT TEST BUZZER

This instrument gives a wonderful high pitched MUSICAL NOTE in the receivers, impossible to obtain with the ordinary test buzzer. The RADIOTONE is built along entirely new lines; it is NOT an ordinary buzzer, reconstructed in some manner. The RADIOTONE has a single fine steel reed vibrating at a remarkably high speed, adjusted to its most efficient frequency at the factory. Hard silver contacts are used to make the instrument last practically forever.

Yes, the RADIOTONE is SILENT. In fact, it is so silent that you must place your ear on top of it to hear its beautiful musical note.

You will be astounded at the wonderfully clear, 500 cycle note, sounding sharply in your receivers. To learn the codes there is absolutely nothing like it. With the radiotone, a key and one dry cell and ANY telephone, a line learner's set is had. Two or more such sets in series will afford no end of pleasure for intercommunication work. Shipping Weight 1 lb.

Radiotone as described.....each **$.90**

IMMEDIATE SHIPMENTS

The "Electro" Telegraph

is not a toy, but a practical, honestly built telegraph outfit, which not only sounds but works like the big commercial instruments. By studying the code for 30 days you can become a first-class telegraph operator. Such operators are in big demand now. Outfit consists of TWO complete telegraph instruments each measuring 3½ x 2½ x 2¾. All metal parts are highly nickel plated, including key lever. Note hard rubber knob. Telegraph Code Chart, telegraph blanks and connecting wire comes with set, but no batteries. Outfit works on 2 dry cells (one cell for each instrument). The "Electro" is the ONLY Outfit that works both ways, each station can call; no switches, no extras. Nothing to get out of order. Guaranteed to please you or money back. **Price Complete as Illustrated (TWO INSTRUMENTS).... $1.25**

Shipping Weight, 2 lbs.

IMMEDIATE SHIPMENTS

The "Electro" Codophone (*Patents Pending*)

$1.50

What this remarkable instrument is and does.

The "Electro" Codophone is positively the only instrument made that will imitate a 500 cycle note exactly as heard in a Wireless receiver. The loud-talking receiver equipped with a horn, talks so loud that you can hear the sound all over the room, even if there is a lot of other noise.

THAT'S NOT ALL. By lessening or tightening the receiver cap, a tone from the lowest, softest quality, up to the loudest and highest screaming sound can be had in a few seconds.

FOR INTERCOMMUNICATION. Using two dry cells for each instrument, two Codophones when connected with one wire and return ground, can be used for intercommunication between two houses one-half mile apart.

One outfit alone replaces the old-fashioned learner's telegraph set, consisting of key and sounder.

The "Electro" Codophone is a handsome, well made instrument, fool proof, and built for hard work. Contacts are of hard silver ⅛ inch in diameter, that will outlast the instrument.

There is also a neat code chart and full directions enabling any intelligent young man or girl to learn the codes within 30 days, practising one-half hour a day.

Size: 6¾ x 3 x 2¾." Shipping weight, 2 lbs.

The "Electro" Codophone as described, complete..... **$1.50**

MY INVENTIONS.

(*Continued from page* 905)

the professors had written him to the effect that unless he took me away from the Institution I would be killed thru overwork. Thereafter I devoted myself chiefly to physics, mechanics and mathematical studies, spending the hours of leisure in the libraries. I had a veritable mania for finishing whatever I began, which often got me into difficulties. On one occasion I started to read the works of Voltaire when I learned, to my dismay, that there were close on one hundred large volumes in small print which that monster had written while drinking seventy-two cups of black coffee per diem. It had to be done, but when I laid aside the last book I was very glad, and said, "Never more!"

My first year's showing had won me the appreciation and friendship of several professors. Among these were Prof. Rogner, who was teaching arithmetical subjects and geometry; Prof. Poeschl, who held the chair of theoretical and experimental physics, and Dr. Allé, who taught integral calculus and specialized in differential equations. This scientist was the most brilliant lecturer to whom I ever listened. He took a special interest in my progress and would frequently remain for an hour or two in the lecture room, giving me problems to solve, in which I delighted. To him I explained a flying machine I had conceived, not an illusionary invention, but one based on sound, scientific principles, which has become realizable thru my turbine and will soon be given to the world. Both Professors Rogner and Poeschl were curious men. The former had peculiar ways of expressing himself and whenever he did so there was a riot, followed by a long and embarrassing pause. Prof. Poeschl was a methodical and thoroly grounded German. He had enormous feet and hands like the paws of a bear, but all of his experiments were skillfully performed with clock-like precision and without a miss.

It was in the second year of my studies that we received a Gramme dynamo from Paris, having the horseshoe form of a laminated field magnet, and a wire-wound armature with a commutator. It was connected up and various effects of the currents were shown. While Prof. Poeschl was making demonstrations, running the machine as a motor, the brushes gave trouble, sparking badly, and I observed that it might be possible to operate a motor without these appliances. But he declared that it could not be done and did me the honor of delivering a lecture on the subject, at the conclusion of which he remarked: "Mr. Tesla may accomplish great things, but he certainly never will do this. It would be equivalent to converting a steadily pulling force, like that of gravity, into a rotary effort. It is a perpetual motion scheme, an impossible idea." But instinct is something which transcends knowledge. We have, undoubtedly, certain finer fibers that enable us to perceive truths when logical deduction, or any other willful effort of the brain, is futile. For a time I wavered, imprest by the professor's authority, but soon became convinced I was right and undertook the task with all the fire and boundless confidence of youth.

I started by first picturing in my mind a direct-current machine, running it and following the changing flow of the currents in the armature. Then I would imagine an alternator and investigate the processes taking place in a similar manner. Next I would visualize systems comprising motors and generators and operate them in various ways. The images I saw were to me perfectly real and tangible. All my remaining term in Gratz was past in intense but fruitless efforts of this kind, and I almost came to the conclusion that the problem was insolvable. In 1880 I went to Prague, Bohemia, carrying out my father's wish to complete my education at the University there. It was in that city that I made a decided advance, which consisted in detaching the commutator from the machine and studying the phenomena in this new aspect, but still without result. In the year following there was a sudden change in my views of life. I realized that my parents had been making too great sacrifices on my account and resolved to relieve them of the burden. The wave of the American telephone had just reached the European continent and the system was to be installed in Budapest, Hungary. It appeared an ideal opportunity, all the more as a friend of our family was at the head of the enterprise. It was here that I suffered the complete breakdown of the nerves to which I have referred. What I experienced during the period of that illness surpasses all belief. My sight and hearing were always extraordinary. I could clearly discern objects in the distance when others saw no trace of them. Several times in my boyhood I saved the houses of our neighbors from fire by hearing the faint crackling sounds which did not disturb their sleep, and calling for help.

In 1899, when I was past forty and carrying on my experiments in Colorado, I could hear very distinctly thunderclaps at a distance of 550 miles. The limit of audition for my young assistants was scarcely more than 150 miles. My ear was thus over thirteen times more sensitive. Yet at that time I was, so to speak, stone deaf in comparison with the acuteness of my hearing while under the nervous strain. In Budapest I could hear the ticking of a watch with three rooms between me and the time-piece. A fly alighting on a table in the room would cause a dull thud in my ear. A carriage passing at a distance of a few miles fairly shook my whole body. The whistle of a locomotive twenty or thirty miles away made the bench or chair on which I sat vibrate so strongly that the pain was unbearable. The ground under my feet trembled continuously. I had to support my bed on rubber cushions to get any rest at all. The roaring noises from near and far often produced the effect of spoken words which would have frightened me had I not been able to resolve them into their accidental components. The sun's rays, when periodically intercepted, would cause blows of such force on my brain that they would stun me. I had to summon all my will power to pass under a bridge or other structure as I experienced a crushing pressure on the skull. In the dark I had the sense of a bat and could detect the presence of an object at a distance of twelve feet by a peculiar creepy sensation on the forehead. My pulse varied from a few to two hundred and sixty beats and all the tissues of the body with twitchings and tremors which was perhaps the hardest to bear. A renowned physician who gave me daily large doses of Bromid of Potassium pronounced my malady unique and incurable. It is my eternal regret that I was not under the observation of experts in physiology and psychology at that time. I clung desperately to life, but never expected to recover. Can anyone believe that so hopeless a physical wreck could ever be transformed into a man of astonishing strength and tenacity, able to work thirty-eight years almost without a day's interruption, and find himself still strong and fresh in body and mind? Such is my case. A powerful desire to live and to continue the work, and the assistance of a devoted friend and athlete accomplished the wonder. My health returned and with it the vigor of mind. In attacking the problem again I almost regretted that the struggle was soon to end. I had so much energy to spare. When I undertook the task it was not with a resolve such as men often make. With me it was a sacred vow, a question of life and death. I knew that I would perish if I failed. Now I felt that the battle

HIGH SCHOOL COURSE IN TWO YEARS

Are you one of the 98% who didn't finish High School? If so you are badly handicapped. Without this training you are barred from a successful business career, from the leading professions, from well-paid civil service jobs, from teaching and college entrance, in fact from all worthwhile positions.

GET THIS TRAINING NOW! You don't want to be handicapped nor do you have to be. Let the American School give you the training you missed. Our High School Course covers every subject taught in a resident school. It will broaden your knowledge, make you keen, alert and capable and fit you to earn a higher salary. You can complete the entire course in two years.

TAKE 10 LESSONS AT OUR EXPENSE

Test this Course at our expense. Take ten full examinations, then if you don't feel satisfied you are not out one cent. Training alone will make you master of your work, able to think and act for yourself, and competent enough to secure and hold the position you want. Whether you lack High School training or specialized instruction NOW is the time to get it.

BIG DEMAND FOR SKILLED WORKERS

The demand was never greater for skilled workers in every trade and profession. The pay was never higher—the opportunities never greater. Train and get into the game for all it is worth. We guarantee satisfaction. You do not risk one cent. Check and mail Coupon NOW. We will promptly send you full details and Free Bulletin.

The Purpose of This Analog Is to Portray, As Faithfully As Possible, the Phenomena of Tesla's Rotating Magnetic Field So As to Make Them Easily Understandable to the Average Reader. The Two Alternating Fluxes Are Represented By Streams of Water Having the Same Relation As to Phase, Amplitude and Direction. The Magnetic Polarity of the Rotor Is Imitated By the Employment of a Body So Shaped As to Behave, With Respect to the Streams, Exactly As the Rotor With Respect to the Poles. Moreover, the Corresponding Rotating and Stationary Parts Are Given a Similar Appearance and Are Disposed In Like Manner. To Make the Analog Complete, It May Further Be Assumed That the Liquid Is Compressible So That There Will Be a Phase Displacement Between Pressure and Flow As That Existing Between Electro-Motive Force and Current.

www.americanradiohistory.com

MY INVENTIONS.

(*Continued from page 907*)

was won. Back in the deep recesses of the brain was the solution, but I could not yet give it outward expression. One afternoon, which is ever present in my recollection, I was enjoying a walk with my friend in the City Park and reciting poetry. At that age I knew entire books by heart, word for word. One of these was Göethe's "Faust." The sun was just setting and reminded me of the glorious passage:

"Sie rückt und weicht, der Tag ist überlebt,
Dort eilt sie hin und fördert neues Leben.
Oh, dass kein Flügel mich vom Boden hebt
*Ihr nach und immer nach zu streben!**

* * * * * * *

Ein schöner Traum indessen sie entweicht.
Ach, zu des Geistes Flügeln wird so leicht
Kein körperlicher Flügel sich gesellen!"†

As I uttered these inspiring words the idea came like a flash of lightning and in an instant the truth was revealed. I drew with a stick on the sand the diagrams shown six years later in my address before the American Institute of Electrical Engineers, and my companion understood them perfectly. The images I saw were wonderfully sharp and clear and had the solidity of metal and stone, so much so that I told him: "See my motor here; watch me reverse it." I cannot begin to describe my emotions. Pygmalion seeing his statue come to life could not have been more deeply moved. A thousand secrets of nature which I might have stumbled upon accidentally I would have given for that one which I had wrested from her against all odds and at the peril of my existence.

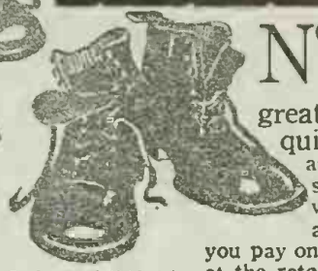
* "The glow retreats, done is the day of toil;
It yonder hastes, new fields of life exploring;
Ah, that no wing can lift me from the soil,
Upon its track to follow, follow soaring!"

† A glorious dream! though now the glories fade.
Alas! the wings that lift the mind no aid
Of wings to lift the body can bequeath me."

TESLA ON HIGH FREQUENCY GENERATORS.

Editor, ELECTRICAL EXPERIMENTER:

It is to be regretted that a letter addrest to me by Mr. J. Harris Rogers, in your care, was published in the march number of the ELECTRICAL EXPERIMENTER, altho the concurrence of our views in some wireless features might have made this desirable to so wide-awake and enterprising a periodical as yours.



Mr. Rogers seems to be a very appreciative gentleman and nothing would be farther from my thoughts than to detract anything from his merit, but in a separate contribution, which I expect to prepare for your next issue, I shall express myself on this subject without prejudice and in the interest of truth. However, the article by your Mr. H. Winfield Secor on "America's Greatest War Invention—The Rogers Underground Wireless" contains a reference to "a novel and original high frequency generator" of Mr. Rogers' invention. May I not —to use the President's elegant expression —call attention to the fact that this device was described by me years ago, as will be evident from the following excerpt of a communication which appeared in the *Electrical Review* of March 15, 1899. In speaking of circuit controllers, I said: "I may mention here, based on a different principle, which is incomparably more effective, more efficient, and also simpler on the whole. It comprises a fine stream of conducting fluid which is made to issue, with any desired speed, from an orifice connected with one pole of a generator, thru the primary of the induction coil, against the other terminal of the generator placed at a small distance. This device gives discharges of a remarkable suddenness, and the frequency may be

Foreman and Superintendents $1800 to $5000 Yearly

Learn to Fill Bigger Shoes

Engineers (all kinds) $2000 to $5000 Yearly

Office Manager or Auditor $1800 to $5000 Yearly

NO matter what kind of work you are doing now, a set of these great home study books will quickly fit you for a bigger and better paying job. We will send any set you select for one week's FREE examination, and if you want to keep them you pay only the special reduced price—at the rate of 50 cents a week. This is your opportunity to make more money—grasp it NOW. Use these books and a little spare time and LEARN TO FILL BIGGER SHOES.

Carpentry and Contracting

Five volumes, 2138 pages and more than 400 illustrations. Prepares for Contractor, Building Superintendent and Carpenter Foreman. Regular price, $25.00. Special price, $17.80.

Civil Engineering

Nine volumes, 3900 pages and 3000 illustrations, plates and diagrams. Prepares for Civil or Structural Engineer, Transitman, Estimator, Designer or Chief Draftsman. Regular price, $45.00. Special price, $29.80.

Telephony and Telegraphy

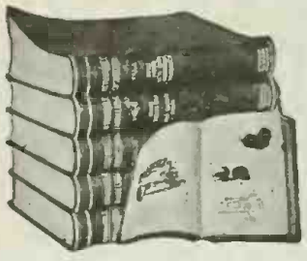
Four volumes, 1728 pages and 2000 illustrations, plates and diagrams. Prepares for Telephone Engineer, Wire Chief, Exchange Manager, Trouble Man or Telegrapher. Regular price, $20.00. Special price, $12.80.

Steam and Gas Engineering

Seven volumes, 3300 pages and 2600 illustrations, plates, diagrams, etc. Prepares for Stationary, Marine or Locomotive Engineer or Fireman. Regular price, $35.00. Special price, $21.80.

Law and Practice

(with Reading Course in 25 bound pamphlets). Thirteen volumes, 6000 pages and 24 illustrations. Prepares for all Bar Examinations. A wonderful aid to business men. Regular price, $72.00. Special price, $39.80.



Practical Accounting

Four volumes, 1840 pages and 800 illustrations, plates and diagrams. C. P. A. questions and practical problems. Prepares for Accountant, Bookkeeper or Cost Clerk. Regular price, $20.00. Special price, $12.80.

Pay Raisers

These books are written by well known authorities—the top-notchers in each line. They will help you make more money. You can't fail to understand them, because they are written in plain, everyday language. Thousands of photographs, diagrams, charts, etc., help to make difficult points as simple as A-B-C.

See our Free Examination—no money down offer below

Ask Our Experts

With these books goes free of all charge a $12.00 Consulting Membership in the American Technical Society. If any question puzzles you—write us. Our corps of experts and engineers will solve any problem. Ask all the questions you want for a whole year. This service is absolutely FREE.

Automobile Engineering

Five volumes, 2400 pages and 2000 illustrations. Prepares for Garage Foreman, Automobile Mechanic or Chauffeur. Invaluable to car owners. Regular price, $25.00. Special price, $17.80.

Machine Shop Practice

Six volumes, 2300 pages and 2500 illustrations. Prepares for Machine Shop Superintendent or Foreman, Foundryman, Pattern Maker, Tool Designer or Tool Maker. Regular price, $30.00. Special price, $19.80.

Sanitary, Heating and Ventilating Engin'ring

Four volumes, 1454 pages and more than 1400 illustrations, etc. Prepares for Sanitary Engineer, Heating and Ventilating Engineer, Master Plumber or Plumber. Regular price, $20.00. Special price, $13.80.

Mechanical and Architectural Drawing

Four volumes, 1678 pages and more than one thousand illustrations. Prepares for Architectural or Mechanical Draftsman. Regular price, $20.00. Special price, only $13.80.

Electrical Engineering

Seven volumes, 3000 pages and 2600 illustrations, plates and diagrams. Prepares for Electrical Engineer, Power Plant Superintendent, Substation Operator or Electrician. Regular price, $35.00. Special price, $19.80.

Accountancy and Business Management

Ten volumes, 3680 pages and 1987 illustrations, forms, etc. Prepares for Certified Public Accountant, Auditor, Office Manager, Accountant, Credit Man or Bookkeeper. Regular price, $50.00. Special price, $24.80.

DON'T SEND ANY MONEY!

Write the name of the books you want on the coupon and mail it today. We will send the books at once, express collect, and you can use them just as if they were your own for a whole week. If you decide you don't want to keep them, send them back at our expense. If you like the books, as thousands of other men have after examination, just send us $2.00. You can send the balance of the special reduced price the same way—$2.00 each month (50 cents a week).

Start right now and learn to fill bigger shoes. There will be a better job looking for you if you do. Be ready to meet it when it comes. *Send the coupon now.*

American Technical Society, Dept. T3384, Chicago, Ill.

American Technical Society, Dept. T3384, Chicago, Illinois

Please send me set of _____ for 7 days' examination, shipping charges collect. I will examine the books thoroughly and, if satisfied, will send $2 within 7 days and $2 each month until I have paid the special price of _____. If I decide not to keep the books, I will return them by express at your expense. Title not to pass to me until the set is fully paid for.

Chemical Laboratory

We present herewith to our friends our new E. I. Co. Chemical Laboratory which contains real chemicals and apparata to perform real chemical experiments. This outfit is not a toy, put up merely to amuse, but a practical laboratory set, with all the chemicals, apparata and reagents necessary to perform real work and to teach the beginner all the secrets of inorganic chemistry. With this outfit we give free a book containing a Treatise in Elementary Chemistry, useful data and recipes, and 100 instructive and amusing experiments.

It contains the following 44 chemicals:

Alum $Al_2(SO_4)_3$, $(NH_4)_2SO_4$
Antimony (powdered) (Sb)
Ammonium Aqua (NH_3+H_2O)
Ammonium Carbonate $(NH_4)_2CO_3$
Ammonium Chloride (NH_4Cl)
Ammonium Sulphate $(NH_4)_2SO_4$
Barium Chloride ($BaCl_2$)
Boric Acid (H_3BO_3)
Brimstone (Sulphur) (S)
Calcium Chloride ($CaCl_2$)
Calcium Oxide (CaO)
Calcium Sulphate ($CaSO_4 2H_2O$)
Charcoal (Carbon) (C)
Chloride of Zinc ($ZnCl_2$)
Copper Sulphate ($CuSO_4$)
Ferrous Sulphate ($FeSO_4$)
Ferrous Sulphide (FeS)
Glycerol (Glycerine) $C_3H_5(OH)_3$
Hydrochloric Acid (HCl)
Iodine (I)
Iron Chloride ($FeCl_2$)
Iron Oxide (Fe_2O_3)
Lead Acetate Pb $(C_2H_3O_2)_2$
Litmus Paper
Magnesium Carbonate ($MgCO_3$)
Manganese Dioxide (MnO_2)
Mercury (Quicksilver) (Hg)
Nickel Chloride ($NiCl_2$)
Oxalic Acid ($H_2C_2O_4$)
Sodium Bicarbonate ($NaHCO_3$)
Sodium Borate ($NaBO_2$)
Sodium Carbonate (Na_2CO_3)
Sodium Chloride (NaCl)
Sodium Nitrate ($NaNO_3$)
Sodium Phosphate (Na_2HPO_4)
Sodium Sulphate (Na_2SO_4)
Sodium Sulphite (Na_2SO_3)
Stannous Chloride ($SnCl_2$)
Sulphate of Nickel ($NiSO_4$)
Sulphate of Zinc ($ZnSO_4$)
Sulphuric Acid (H_2SO_4)
Tin (Granulated) (Sn)
Zinc (Metal) (Zn)
Zinc Carbonate ($ZnCO_3$)

The following apparata are furnished:

One Standard Washbottle
One Alcohol Lamp
One Conical Glass Measure
One Erlenmeyer Flask
One Glass Funnel
One Delivery Tube
Six Assorted Test-Tubes
One Test-Tube Holder
Ten Sheets of Filter Paper
One Glass Dropper
One Spoon Measure
Glass Tubing
One book containing Treatise on Elementary Chemistry and 100 Chemical Experiments to be performed with this outfit.

DESCRIPTION OF THE OUTFIT:

The outfit consists of forty-four (44) Chemicals all C. P. (chemical pure) put up in appropriate wooden boxes, glass bottles, and hermetically closed jars. The acids are put up in glass bottles, with ground-in glass stoppers and there is a sufficient quantity of chemicals supplied (mostly one to two ounces) enough to make dozens of experiments with each. See list of Chemicals herewith.

The apparata furnished are all of the best obtainable make and of standard laboratory size and shape. A list of the 17 pieces of apparata furnished with this outfit is printed also herewith.

The Instruction book is a real **Chemistry Course for the Beginner.** Some of the Contents are: **Division of Matter:** This is a Treatise on Elementary Chemistry and deals with the theory of the Elements, Molecules and Atoms, etc. **Chemical Nomenclature.** This explains in simple language the derivation of the chemical names of the Elements and their compounds. There is a chapter on **Laboratory Operations; Glass Working; First Aid; Fire Extinguishers; Experimenters' Aphorisms,** etc.

A good part of the book is devoted to Weights and Measures. The Metric System, the English system and the U. S. System are fully explained.

The following tables are furnished: Symbols and Atomic weights of the Elements; Measures of Weights, Volume, Capacity and Length; Per Cent solutions; Conversion of Measure expressed in parts; Poisons and their antidotes; Technical and common name of chemical substances; Formulas for Cleaning various substances, etc., etc.

Among the **100 Experiments** are:

How to make chemical tricks; How to make invisible and magic inks; How to test flour; How to test soil; How to Make Chlorine Gas and smoke (German War Gas); How to bleach cloth and flowers. How to produce Oxygen and Hydrogen; How to make chemical colors; How to test Acids and Alkalies and hundreds of interesting hints and formulas.

The price is still $5.00

Shipping Weight 10 lbs.

(Can be shipped by Express only.) Send your order today to:

PRACTICAL CHEMICAL EXPERIMENTS.

(*Continued from page* 894)

tee, and must furnish certificates of good character and honesty. These secrets have been handed down faithfully from one generation to another for hundreds of years.

QUESTIONS AND ANSWERS IN CHEMISTRY.

Standard Soap Solution.

Q. 1. Roy Munsell, Henryetta, Okla., wants to know the method of preparing the Standard Soap Solution as mentioned in the lesson on water testing of the "Experimental Chemistry" lessons.

A. A strong solution of this soap is first prepared by rubbing together in a mortar, 75 grams of the so-called "lead plaster" (which consists practically of lead oleate), which may be obtained from your druggist, and 20 grams of dry potassium carbonat. When the two are thoroly mixed a small quantity of methylated alcohol is added, and the mixture worked to the consistency of a thin smooth cream. More spirit is then added, and the contents of the mortar rinsed, using more of the spirits for this purpose. This is then collected in a bottle and the mixture placed aside to settle. The clear liquid is decanted off thru a filter, and the sediment finally washed upon the filter with more spirit. The volume of the liquid may now be made up to 200 or 250 cc., by adding a mixture of equal volumes of spirit and water.

Solvay Process.

Q. 2. C. H. Hathaway, of Peoria, Ill., desires information regarding the Solvay Process.

A. Sodium Chlorid, commonly known as table salt, is the source from which the sodium alkalies are derived. The starting point of this process is therefore salt—in the form of a good strong salt brine. If you open a bottle of ordinary smelling salts and inhale the vapor, you will immediately recognize the second fundamental of the process in the form of Ammonia, similar to the gas which is contained in the common household ammonia. The third and last fundamental is ordinary carbonic acid gas, the same as is used to make soda water fizz. For the purpose of this process it is obtained from limestone, by heating the stone to a high temperature. Thus we see that Salt, Ammonia and Carbonic acid gas are the three fundamentals upon which the process is based.

The salt brine is saturated with ammonia gas and carbonic acid gas is then blown into this solution of ammonia in the brine.

The process does not take place in one step, but the final products are Sal-ammoniac and crude bicarbonat of soda. The crude bicarbonat of soda separates out as a white powder and the sal-ammoniac remains dissolved. The Ammonia takes the place of the sodium in the salt, and the sodium combines with water and carbonic acid to form the well-known baking soda (Sodium Bicarbonat).

This is separated from the liquids by filtration. It is then necessary to prepare this for a commercial product by heating it in a furnace where it loses all its water and carbonic acid gas. The product is now known as sodium carbonat, or soda ash, the finished product of the Solvay process, and the starting point for other forms of sodium alkalies. (The liquid coming from the filtration process contains the sal-ammoniac, and this is distilled with lime to recover the ammonia to be used over again—no ammonia remains in the soda.)

Mercury Vapor

Q. 3. Gordon Jones, Jr., Cordele, Ga., wants to know how Mercury Vapor is obtained.

A. Under a pressure of 760 mm., mercury boils at 357.25 degrees C., giving off a colorless vapor. Mercury gives off vapor even at ordinary temperatures, and a gold leaf suspended over mercury in a stoppered bottle, gradually becomes white upon the surface, owing to its amalgamation with the mercurial vapor. This vapor is poisonous, giving rise to salivation, such as loosening of the teeth, etc.

Buttermilk in Butter.

Q. 4. Theodore Coughlin, Rochester, N. Y., wants to know why buttermilk is objectionable in butter.

A. Buttermilk is very objectionable as it begins to decompose almost immediately, and sets up fermentation, in the butter itself. See article at head of this month's "Chemistry Department."

BACK NUMBERS CONTAINING "EXPERIMENTAL CHEMISTRY SERIES.

The "Experimental Chemistry" series, by Albert W. Wilsdon, started in the June, 1916 issue of the ELECTRICAL EXPERIMENTER and has run continuously since that date. Prices on the back numbers containing these respective lessons, many of which have been of the greatest value to High School as well as Correspondence School and University Scholars, as has been proven by many letters which we have received from readers of all classes, will be furnisht upon receipt of stamped and addrest envelope. If you wish a first-class and clearly explained treatise on Experimental Chemistry, procure all of the lessons and bind them together. Many valuable and original tables and formulas are included in these lessons which the author has found of particular value in his commercial experience as a chemist.

SCIENCE IN SLANG.

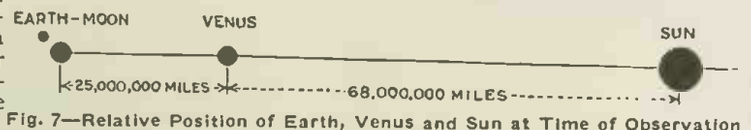

Fig. 7—Relative Position of Earth, Venus and Sun at Time of Observation at Opposition.

"I Can Succeed!"

"What other men have done with the help of the International Correspondence Schools, I can do. If the I. C. S. have raised the salaries of other men, they can raise mine. If they have helped others to advance, they can help me. To me, I. C. S. means 'I CAN SUCCEED.'"

Make up your mind right now that not another day shall pass until you have made *your* start toward success.

For 27 years men in offices, stores, shops, factories, mines, railroads, and in the Army and Navy have been winning promotion and increased salaries through the I. C. S. More than 100,000 men and women are getting ready *right now* with I. C. S. help for the bigger jobs ahead.

No matter where you live, the I. C. S. will come to you. No matter what your handicaps, or how small your means, we have a plan to meet your circumstances. No matter what career you may choose, some one of the 280 I. C. S. Courses will surely suit your needs.

When everything has been made easy for you—when one hour a day spent with the I. C. S. in the quiet of your own home will bring you a bigger income, more comforts, more pleasures, all that success means—can you let another single priceless hour of spare time go to waste? Make your start right now! This is all we ask: Without cost, without obligating yourself in any way, put it up to us to prove how we can help you. Just mark and mail this coupon.

and the stars appear even in the lunar day.

To one equipt with an opera glass on the moon many of the wonders and beauties of our planet would be revealed: the shadows of our lofty mountain peaks would be seen falling across the adjacent plains and passing ram or snow storms would temporarily veil certain portions. Were our most powerful telescopes placed on the moon we could easily distinguish small islands and lakes and cities, as well. All objects five miles or so in diameter would be well within the reach of our great telescopes and we can imagine that the lunar inhabitants would spend a considerable portion of their time in attempting to solve the nature of many mysterious markings that come and go over the face of their nearest neighbor. It is indeed a pity that the opportunity to study a living planet at close range is granted to a world devoid of all forms of life while the great telescopes of our own planet sweep searchingly over a barren mass of lifeless rocks presenting no signs of growth or decay, a desolate and uninhabitable waste.

We have considered how our planet appears from the two other planets that are most likely to be the abode of life, Venus and Mars, and how it would appear if seen from our satellite the moon.

It will not take us long to consider how we would appear from the major planets—Jupiter, Saturn, Uranus and Neptune. The greatest possible distance the earth could depart from the sun viewed from Jupiter would be a little less than twelve degrees. Mercury, as we know, is not an easy planet to observe, yet it departs at times nearly thirty degrees from the sun. Moreover it is so near to the earth that when it is seen near its elongations it appears as a bright first magntitude star. Our planet earth on the other hand is so distant from Jupiter that it would be just barely visible to the naked eye if seen against a black sky. When we consider that it never gets more than twelve degrees from the sun under the most favorable circumstances as viewed from Jupiter and must therefore always be searched for in the light of the sun's rays we see the hopelessness of expecting to see our planet earth from the distance of Jupiter without telescopic aid and were it possible to set up our telescopes at the distance of Jupiter we would find that our little planet earth was not only a most elusive little body but also quite uninteresting when found. It would appear only as a very small half moon with a suspicion of a few dark shadings here and there. As we travel outward from Jupiter to the planets Saturn, Uranus and Neptune our interest in the little planet decreases rapidly. It appears to shrink more and more in size in the telescope until at the distance of Neptune it has become so tiny and so near to the sun that it is hardly worth a search in the telescope.

(The next Installment will appear in the May number.)

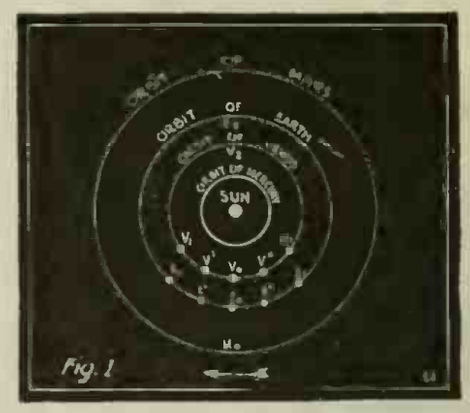

Fig 1. Diagram Showing Relative Positions of Mars and the Three Inner Planets, Earth, Venus, and Mercury, the Three Morning and Evening Stars of Mars. Assuming Mars to Be In the Position M_0 the Planets Are Best Seen When on the Near Side of Their Orbits, Positions E, E', E'' and E_3 for Earth and v, v', v'' and v_3 for Venus. At E_0 and E_3 Earth Is Invisible from Mars, Being In Inferior and Superior Conjunction with the Sun Respectively. At E, and E_2 It Is at Its Eastern and Western Elongations Respectively and at E' and E'' It is at the Greatest Brilliancy. When Venus Is at Its Greatest Brilliancy V' and V'' and the Earth Is in the Far Part of Its Orbit. Beyond E, and E_3 Venus Appears Brighter to the Martians Than Our Own Planet, but When the Earth Is Near E' and E'' It Surpasses Venus in Brightness Because It Is Then Considerably Nearer to Mars.

Experiments in Boston have shown that electric trucks deliver coal at a saving of 3.2 cents per ton mile from the expense of horse delivery and seven cents per ton mile cheaper than gasoline trucks.

Fig. 2. Changes In Size and Appearance of the Disk of the Planet Earth As Seen from Mars In Various Parts of Its Orbit. (1) At Superior Conjunction (E_2 In Fig. 1) Planet Invisible from Mars. (2) Just Before and After Superior Conjunction With the Sun. In This Position the Disk Is Quite Fully Illuminated, But It Is Comparatively Small and Indistinct Being On the Far Side of Its Orbit from Mars and Near the Sun. (3) At Times of Elongation (E, E_2 In Fig. 1). The Earth Is Now At Its Greatest Angular Distance from the Sun and Well Placed for Observation from Mars. (4) At Times of Greatest Brilliancy (E' and E'' In Fig. 1). The Planet Is Now At Its Best for Observation. (5) Just Before and After Inferior Conjunctions. The Planet Is On the Side of Its Orbit Nearest to Mars. But Is too Near the Sun for Good Observations. (6) At Inferior Conjunction (E_0 In Fig. 1) Nearest to Mars But In Line With Sun and Therefore Invisible from Mars.
The Illuminated Portion of the Planet's Disk Is Always Turned Toward the Directions of the Sun.

Ultra-violet rays are being blamed for the fading specimens in European museums, and a search is being made for a glass for cases that will cut off the rays and at the same time be colorless and inexpensive.

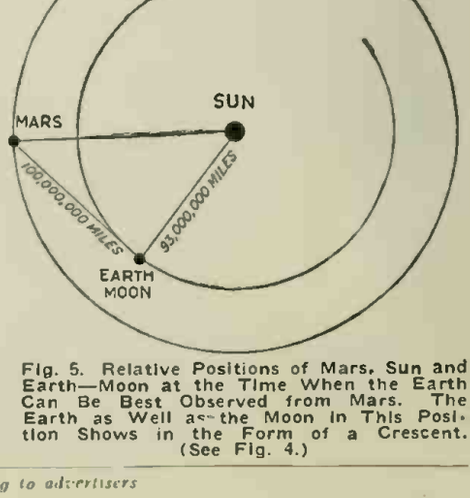

Fig. 5. Relative Positions of Mars, Sun and Earth—Moon at the Time When the Earth Can Be Best Observed from Mars. The Earth as Well as the Moon In This Position Shows in the Form of a Crescent. (See Fig. 4.)

www.americanradiohistory.com

PATENT ADVICE

Edited by H. GERNSBACK

In this Department we publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Regular inquiries address to "Patent Advice" cannot be answered by mail free of charge. Such inquiries are publisht here for the benefit of all readers. If the idea is thought to be of importance, we make it a rule not to divulge all details, in order to protect the inventor as far as it is possible to do so.

Should advice be desired by mail a nominal charge of $1.00 is made for each question. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

NOTICE TO CORRESPONDENTS

Questions on Patent Advice are answered in this department every month, and naturally each question must take its turn. We have received so many letters during the past months that it is absolutely impossible for us to answer them all in the "Experimenter." Thus, for instance, the answers appearing in this issue are of letters going back as far as July, 1918. We would therefore urge our correspondents to bear this in mind, and if an answer is wanted quickly, correspondents should make themselves acquainted with the rules printed above.

Angle Finder.

(305) Geo. E. Zeigler, Urbana, Ohio, submits a device which he calls an *angle-finder*. It is an instrument to show on a scale directly the degree of any angle. Such an instrument could be used in connection with drafting work, building, construction, etc. Our advice is asked.

A. In the instrument described, use is made of a spirit tube with the usual air bubble, and by displacing the apparatus, the angle can be read off in a certain manner. This device itself is not new, and a similar one has been used on autos to read the percentage of the grade, and we do not think it would be possible for this reason to obtain a patent.

Submarine Shell.

(306) J. R. Pell, Jr., Parkershurg, W. Va., has submitted an idea on a submarine shell which only explodes fifteen feet under water. Diagram submitted shows the electrical connections which are acted upon chiefly by salt water, making a contact as soon as the shell comes within about 15-ft. under the water. Our advice is asked.

A. There is nothing fundamentally new shown in this device, and there are much better ones made which have been used freely in the war.

Electric Depth Bomb.

(307) Geo. W. Curtis, Detroit, Mich., has invented a depth bomb. In this particular bomb, when it is dropt, salt water enters thru the water inlets, and being conductive, completes a circuit between certain contacts. These contacts may be regulated by a water regulator in such a way, making it possible to explode a homb at any depth.

A. Nothing new is shown in this idea, and we doubt very much if a patent can be obtained upon it. There are many patents on electrical depth bombs of this kind.

Flue Cleaner.

(308) Wm. H. Roberts, Chandler, Ind., has invented a device which he terms a "flue cleaner." In short, the idea consists of a fan arranged in the chimney in such a manner that the soot is cleaned out automatically, so that the latter will not clog the air passages of the flues. Various means are shown to carry out the idea.

A. While highly ingenious, we doubt if the device will work. Soot will he precipitated along the walls, fan or no fan, to our mind, and we do not think that the problem can be solved satisfactorily in this manner.

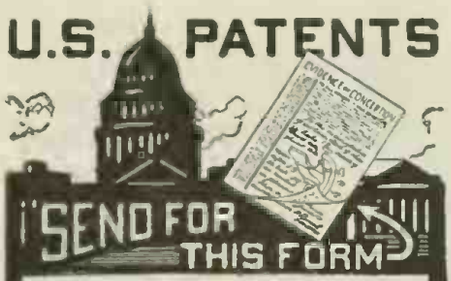
Steam Boat Brake.

(309) Otto I. Kirby, St. Vincent, B. W. I., submits an idea of a brake for steamers or boats. The idea in short is to have large steel vanes folded up against the body of a ship in normal position. If the boat is to be stopt, the vanes automatically open up at right angles to the boat, and the ship, thereby exposing an additional surface to the water, consequently must slow down.

A. This idea is a good one but unfortunately it has been described before, and to our mind no patent can be obtained upon it today. We do not think the device works out in practise.

Grass Cutter.

(310) John C. Reno, Spring Brook, Wis., has an idea of an arrangement to clean out grass that grows over the sidewalk. The device is to be made of sheet steel and by having a triangular nose, in our correspondent's opinion, such a tool would clean out the grass very readily in the corners between roadway and curb.



A. While no doubt this device would work satisfactorily on the ordinary concrete sidewalk, there would certainly be trouble if the road was compromised of cobblestones for instance. Otherwise, we find no trouble with the device, and think that a patent can be obtained upon it.

Fire Truck Device.

(311) M. Dunbar, Lorain, Ohio, writes: "I wish your advice about a patent on an electrical device that will immediately start the engine of a fire truck. My idea is, as soon as the alarm rings it closes the circuit which starts off the engine of the fire truck. Please advise if this idea is patentable."

A. Providing such a device can be made rugged enough, so that it conforms with the Fire Department's exacting requirements, we believe that such a device should prove of considerable benefit, altho most of the Fire Departments now have devices whereby the fire under the engines is started within a few seconds after the alarm has sounded.

U.S. PATENTS

Don't Lose Your Rights

Before disclosing your invention to anyone send for blank form "Evidence of Conception" to be signed and witnessed. A sample form together with printed instructions will show you just how to work up your evidence and establish your rights before filing application for patent. As registered patent attorneys we represent hundreds of inventors all over the U. S. and Canada in the advancement of inventions. Our schedule of fees will be found reasonable. The form "Evidence of Conception" sample, instructions relating to obtaining of patent and schedule of fees sent upon request. Ask for them,—a post card will do.

Acetylene Bunsen Burner.

(312) Richard E. Mathes, Excelsior, Minn., writes: "I have devised a scheme whereby an acetylene gas plant for bunsen burners and gas in a small chemical laboratory may be installed at very low cost. This is meant especially for the amateur who does not have gas in his home. Is this practical? Could I sell a patent for it? If so, what would it be worth? Could I use an ordinary bunsen burner as part of the patent without infringement?"

A. We see nothing fundamentally new about this idea, as burners of this kind have been used for years, and such a device is well known in the art. We are quite positive that a patent could not be obtained upon it.

Double Lock.

(313) Chas. H. Morgan, Newton, Iowa, sends in an idea on a Double Hasp Lock which can be operated from both sides of the door. He wants to know if this device can be patented.

A. We see nothing fundamentally new in this, and furthermore doubt the utility of the device. We also doubt if a patent can be obtained on it.

Envelope.

(314) José Mata, San Francisco, Cal., submits a sample of an envelope. He wishes us to give him our advice if such an envelope could be patented and if it is feasible. As will be noted, a string with a knot at each end is glued into the envelope when made.

A. This is a good idea but it is not new. Similar devices have been on the market for a long time, and some years ago very many magazines used a string of this kind to open up the mailing wrapper, simply by having a thread incorporated into the magazine wrapper. This thread was pulled in a similar fashion as the string of our correspondent's envelope. We are positive no patent can be obtained on this device.

Automatic Fuse Replacer.

(315) Wm. Sambur, New York City, says: "I would like to know if an automatic fuse replacer which instantly inserts new fuses after extracting burnt out fuses would be patentable. This device could be manufactured at a cost of $3.00. Would this be a good selling article? I await anxiously the next issue of the ELECTRICAL EXPERIMENTER for my answer."

A. Without having the necessary details, it is impossible for us to give advice. Correspondents should bear in mind that merely by giving vague indications, it is extremely dangerous for us to give advice as well as for correspondents to accept it.

Smoke Stack.

(316) Walter A. Buckheim, Boulder, Colo., asks us: "Please let me know thru your magazine if the following idea is patentable. It is desired to construct a chimney or factory smoke stack with rifles or vanes which will impart a rotary motion to the escaping gases. In forced draft plants the gases can be given a rotary motion by mechanical means. In this way a miniature whirlwind will be created which will hold the gases in a narrow column and carry them to a great height, where especially, if they are poisonous, they will be out of everyone's way. The gases will in effect pass thru a chimney made of air."

A. This is a clever idea, but it has one great fault, namely, it won't work. No matter what arrangement were used and even if you were to expend 10,000 H. P. to push the gases out of the smoke stack, if a moderately strong wind was blowing the gases would positively be forced sidewise, and if the wind was blowing earthward, the gases in this case would be blown earthward too. You cannot hope to raise a gaseous column into the air and prevent its swaying sidewise by any known means. For this reason smelters and chemical industries having to do with poisonous gases build their chimneys as high as possible. There are some cases known where a chimney has actually been laid up the side of a moderate mountain in order to let the gases escape at the top as far away from human habitation as possible.

Radio Break-In System.

(317) C. E. Mitchell, Miami, Fla., submits for our advice the following idea: "I have a break-in system for use in wireless telegraphy that does away with anchor gaps and other troublesome apparatus used in break-in systems. It consists of the ordinary heavy wireless key, with an attachment at the rear, working something similar to a compound lever. When the key is raised the antenna is connected to the receiver, the detector unshorted, and circuit to power transformer opened. In this manner the receiver is always in a receptive condition at the instant the key is raised. The idea provides for an extension in length to the ordinary wireless key and may be installed in any circuit with ease and does not hamper the pressure adjustment of the key. This means of break-in will prevent considerable interference and loss of time.

A. This is not at all a new idea and the Patent Office is full of break-in systems of this kind. A great many similar ones have been described in the past volumes of the ELECTRICAL EXPERIMENTER. Many of these systems are very good, as is our correspondent's, and many are actually in use, particularly amateurs seem to like them.

NEW PULL SOCKET HAS CURRENT TAP.

In many cases it is desirable to connect an electrical appliance to a single-lamp wall bracket or ceiling fixture without interfering with the lamp. A very convenient way for doing this has been provided by means of the new pull socket current tap illustrated. It is a combination pull socket and plug receptacle built into a single compact body. It is also supplied with a ⅛", ¼", ⅜" or pendent cap. The pull chain controls the current to the lamp socket proper, whereas the terminals of the receptacle in the side of the body are continuously in circuit.

An advantage that this type of socket gives is that it eliminates the annoyance of the long cord running from side-wall outlets. By means of the new fitting, current can be supplied directly below the fixture

to operate various table appliances or other portable devices such as are in general use, without sacrificing the use of light from the lamp itself. It thus eliminates the annoyance of groping about in the dark while trying to plug into the socket.

AERONAUTICAL EXPOSITION AT NEW YORK.

Army Day at the Aeronautical Exposition in Madison Square Garden and the 69th Regiment Armory, New York City, brought several thousand uniformed spectators at the afternoon and evening sessions. Secretary of War Newton D. Baker was to have been the guest of honor, but at the last minute he notified the officials of the exposition that he had been summoned by the President for a conference. Major General Thomas Barry, Commandant of the Department of the East, accompanied by members of his staff, represented the Secretary of War.

At the wireless telephone exhibit in the 69th Regiment Armory, Lieutenant J. F. Adams entertained the spectators by reading news from a daily newspaper to ships in the harbor and places on land equipt with apparatus. The spectators, by means of a sounding horn, were able to hear the answers he received.

Brigadier General Guy Livingston, who represented the British Air Ministry in this country, was an interested spectator at the afternoon session. He said that he believed the Atlantic would be crost by airplane or dirigible within the next two or three months.

TESLA ON HIGH FREQUENCY GENERATORS.

(*Continued from page* 909)

brought within reasonable limits, almost to anything desired. I have used this device for a long time in connection with ordinary coils and in a form of my own coil with results greatly superior in every respect to those obtainable with the form of your letter, make a few statements referring to such make-and-break devices in general, and various forms based on this new principle."

I may add that a great many forms of this apparatus were constructed and employed by me for a long time, proving very convenient and useful. Water does not give particularly good results, being incapable of causing very abrupt changes, but electrolytes have the property of diminishing enormously in resistance when they are heated and the effects are much more intense. Salts of lithium are especially efficient.

NIKOLA TESLA.

New York, February 20, 1919.

HEL-MET THE KAISER

Send one to your boy in camp; all the boys will want them. Anyone against the Kaiser or Germany should wear this pin. Same size as picture. Handsome metal, black letters. Will wear for years. Men and women wear them — causes laughter wherever seen.

Price 10 Cents

Voice Thrower 10c

Learn to throw your voice into a TRUNK, under the bed, out in the hall or anywhere. Lots of FUN fooling the Teacher, Janitor, Policeman, Parents, Neighbors, or Friends.

THE VENTRILO

is a little instrument that fits into the mouth out of sight. BOYS or GIRLS can use it. NEVER FAILS! A 32-page book on Ventriloquism sent with the VENTRILO for TEN Cents.

NEW FORD JOKE BOOK 1919

All the latest jokes on the Ford auto. Hundreds of them, and all good ones. Spring a new one on your neighbors.

Large book with colored cover by mail, 10c.

Devil Resigns to the Kaiser

Everyone who reads this book is wild over it. Contains the following:— The Kaiser's Dream, A Letter from the Devil to the Kaiser, Kaiser's Prayer, How Satan Resigns to the King of Devils, The Kaiser, etc. Many other stories, jokes, etc., about the German Emperor. Book mailed 10 cents, postage 2 cents extra.

ROGEN X-RAY

Price 10 Cents

HERE, BOYS, is just what you want. With this instrument you can apparently see through clothes, see the bones in your fingers. Think of the fun you can have with it. Sample, by mail, TEN CENTS.

SKULL RING

Here is a handsome, up-to-date Ring, representing a Skull and Cross-Bones. Has stones in the eyes and looks something frightful. Women won't like it, but for men or boys it is a great novelty. Sample, by mail, 15c.

Gee! What a Wad!

This is STAGE MONEY

Looks like the GENUINE STUFF. Some Green backs and some Yellow backs. Create a BIG sensation among your friends. The girls will all be after you when they see the wad. BIG roll of 15 pieces by mail, 10 cents.

Boys Own Toy Maker

and Nine Other Books for 10c

Tells how to make a Telephone, Magic Lantern, Kites, Sail Boat, Stilts, Electric Telegraph, Pop Gun, Red Fire, Galvanic Battery and many other things. This book, with nine other interesting books, mailed for 10c.

ENCHANTED BARREL

The Most Wonderful Pocket Trick Made

CHANGE A CENT INTO A DIME

Ask your friend to drop a dime in the barrel. When he takes it out, Behold! It is a CENT. You make 9 cents every time you fool them. Never fails. They cannot get on to it. Sample barrel, with directions, only.... 10c

NEW YORK TO CHICAGO VIA THE AIR IN 12 HOURS.

(*Continued from page* 856)

this important subject. Mr. Hawley said:

"Aërial transportation is here and here to stay," said the president of the Aero Club, speaking along general lines. Aërial transportation bears the same relation to land and water transportation that the wireless bears to the regular mail and telegraph. It is unlimited by obstacles on land and water; curves are eliminated, and there are no grades to climb after reaching your flying level.

"It has been estimated that aërial express could be carried profitably at a charge of $2 a pound for packages of a given size between New York and Chicago. A twin-motored 'plane can make the New York-Chicago trip without stopping, carrying a thousand pounds of express matter.

"The postoffice has been operating an aërial mail between New York and Washington daily since May 15, 1918, and has cut down the time of transit to two hours. Only small planes are used, which are more expensive than the large ones, when operated on the ton-a-mile basis. Yet the cost has been cut down to 40 cents a mile. It is cheaper than taxicab rates.

"British dirigible balloons, some of which are capable of carrying sixty tons of useful load at a speed of sixty miles an hour, may soon ply between Great Britain and the United States, carrying passengers, mail and express."

HOW ELECTRICITY SERVES WORLD'S LARGEST HOTEL.

(*Continued from page* 858)

own, as they obtain the required electric power and steam for heating and other purposes, from the railroad companies near the respective railroad terminals of which they are located. The Hotel Pennsylvania has a high tension transformer vault in the sub-basement as well as a large switchboard for controlling the power and light supply to the various parts of the building, and there is an auxiliary 500 K.W. steam-driven generating unit installed in the power plant.

My guide suggested that we next visit a typical "guest floor", and so we took an *express elevator* to the ninth floor, there being nineteen floors in all. On each floor there is a lady floor clerk, who has charge of everything on that particular floor, and is responsible for all the service in that particular part of the hotel. Obtaining keys for several of the rooms, we set out to look them over, and as the writer had heard of the far-famed "servidor", long before he had even thought of visiting the hotel, he asked the guide to explain this first of all. The "servidor", as its name implies, is a scheme for rendering service between the guest and the hotel attaches without introducing the objectionable personal touch, which is all right in the public rooms of the hotel, but rarely ever on the guest room floors, excepting when a waiter may have to bring in a table to serve a meal or something of that sort. The accompanying illustration includes a detail drawing of the servidor, which at the same time is also the "door" of the room, and "believe me, Xantippe", that door is one of the greatest masterpieces in all Hoteldom, and thereby hangs a tale, to wit:—In the first place the servi-"door" is made of steel, and finished in a perfect imitation of hard wood such as mahogany, or in some cases walnut, and so cleverly camouflaged that you cannot perceive the difference, unless you knock your head against it. The guide demonstrated all of the features of this most marvelous door at the request of the writer. This door swells out on both sides, giving a depth of ten inches between the inner and outer curved panels, which extend the full height of the door. These hinged steel panels are provided with an interlock, so that the outside or hall door *in the*

STRONGFORT
The Perfect Man

Don't Be Handicapped

You will always stagger under the worst kind of a handicap, if you remain a puny, weak, ailing, skinny, miserable apology for a man. Big men, in the terrific competition of business life today, must be virile, strong, full of health and life and jump and ginger. Weaklings haven't the ghost of a show, *in any position; they* never can advance, their jobs may be taken from them any day and given to some man the boss knows is going to forge ahead.

ARE YOU HANGING ON TO YOUR JOB?

If you are just managing to stagger through your work each day, with constipation, indigestion, biliousness, lack of energy or frazzled nerves taking all the pep out of you, that job of yours will get away some day before you know it. Three million or so husky, hearty, healthy men will soon be back from the camps and the fighting lines in France, *looking for jobs*, and they're the kind of boys employers want!

MAKE YOUR JOB HANG ON TO *YOU!*

That's the only way to rid yourself of the constant fear of being fired. Build yourself up into a MAN, capable of doing all your work and more; show your employer that you are full of vim and vitality; that your body can stand any strain and that your brain is clear and keen, full of new ideas for the business. Make him feel that, and nobody could PRY your job away—the only way you'll lose it will be to take another higher up.

STRONGFORTISM WILL ENABLE YOU TO DO IT

Strongfortism will show YOU, as it has shown thousands of other men on the ragged edge of being fired, how to make yourself too valuable for any employer to lose sight of. No matter how deep a hole of dismal despair you may be in just now, no matter if you feel that you have burned out the last spark of vitality in you by dissipation or early excesses—*Strongfortism can make you over, BUILD YOU UP*, strengthen every vital organ in you and make you fine and fit again.

No druggist's dope or patent bottled humbugs in the Strongfort way—just living life as Nature meant it to be lived and getting the greatest enjoyment out of it. Send for my FREE BOOK "Promotion and Conservation of Health, Strength and Mental Energy." It will show YOU how thousands of other discouraged men have made themselves whole and well and strong again.

STUDENTS ART MAGAZINE, Dept. 441, Kalamazoo, Mich

door cannot be opened by a servant until the inner door is shut and locked. What you can't get via the servidor—ain't! There are two shelves in the servidor which might accommodate a special order of ice cream soda or near-beer from the tap-room, but mostly, so my guide explained, the servidor is intended for clothes intended to be prest over night, or at any time by the hotel valet, and for soiled linen.

The *modus operandi* of the servidor follows:—Suppose you, the guest, have a suit of clothes which you wish prest, and have just arrived at the hotel, and wish to retire at once. You call the telephone operator via your room telephone, and inform her that you have a suit of clothes which you desire prest by the house valet. She does the rest. You go to bed and forget about it. Next morning you awake and open the inner door of the servi-"door", and "pressed-O"! there is your suit as spick and span as ever before, and perhaps if you are lucky, you might find a couple of five dollar silk shirts and a nice roll of clean collars in your servidor, but how could you be expected to be able to tell to whom they beong out of 3,500 guests! Ennerhow, as Abie Kabibble might say, the guests at this hotel are all rich anyway. At least they look it!X? But this is only the start of the tale of the servidor, for you can press one of two buttons on the inside of the door, and open or close a sound-proof ventilator. Also there is another very elaborate and clever mechanical conception incorporated in the knob and lock of the door—this takes the form of a small pin about the size of a lead pencil, placed just under the knob on the hall side of the door. If one of the attachés (in everyday English, the chambermaid), tries to enter the room while it is occupied, she will ascertain this fact without having to rattle the knob about fifteen dozen times, and chuck you into a French fit, wondering if one of the Bolshevik gentlemen is calling on you with a bomb. She simply presses her finger on the projecting pin, just under the knob. If the pin resists the pressure of the finger, then the room is occupied; if not, it is unoccupied. Simple, yes, but someone spent a lot of time to "dope" this out.

The conveniences to be found in the guests' rooms, no matter whether large or small, are all similar, and designed to give the utmost comfort and homelike atmosphere. The basin in each bath room is fitted with three spigots, the two outer ones giving hot and cold water, while the center spigot yields *ice water*, cooled in the hotel's large private refrigerating plant driven by electricity, located in the basement. The rooms as well as all of the halls are cleaned by vacuum cleaners, thus doing away with all dust, besides keeping the carpets and draperies thoroly clean and germproof.

The double rooms do have the cutest little "twin beds" you ever laid eyes on. Each one is fitted with a handsome brass reading lamp attached to the head of the bed, and provided with a silk shade and chain pull socket. Yes, you can read in bed if you want to at one of these palatial hotels. Between the beds or alongside of the single beds, there is a telephone and night lamp table, which also comes in conveniently to hold the immortal "ice water" pitcher. In some of the suites of rooms inspected, the furnishings are very attractive, including large pedestal style dresser lamps with silk shades, on the bureau for milady, and all in all the guests can really feel at home, just as much as if they were in their own residence. We should not forget the electric curling iron heater and the electric fan. Perhaps if you feel so disposed, you would like to have something piping hot made in the chafing dish. If so, one of the maids will bring you an electric chafing dish, which can be easily connected to a special electric floor outlet provided for just such a purpose.

www.americanradiohistory.com

The "Room Service", as it is called in all modern hotels, and which covers the serving of meals in rooms, is very carefully worked out, in the "Pennsylvania" and the "Commodore". At the "Pennsylvania" the system works out in this fashion: Suppose for a moment you are the guest, and that you decide to have breakfast served in your room. You call up the telephone operator and give her your order. She writes it down on her memorandum pad, and as soon as you have finished, she writes it on her telautograph *transmitting platen*. Then two important things immediately happen—*two* telautographs reproduce in writing your exact order for the meal, from coffee to cigars, one telautograph announcing your order in the "room service" kitchen in the basement,—while the second telautograph connected to the same circuit, *but situated on your room floor*, reproduces the order in writing before the "floor clerk" on your floor, and this is the first notice that she receives that you have ordered a meal. The system works out very beautifully in this way, and gives the greatest expedition possible to rapid service. Each floor has its own service pantry, which contains all ordinary things such as bread and butter, and which are supplied from this pantry. In this room there are also automatic high-speed electric dumbwaiters communicating with the "room service" kitchen in the basement, and as soon as any broiled meat, such as chops, steaks, etc., are prepared in the main kitchen, they are whisked skyward *via* the automatic dumbwaiter to your floor. As soon as the dumbwaiter reaches the floor, a buzzer starts signaling the fact, buzzing continuously until the door is opened; the victuals are removed and the door closed, after which the dumbwaiter is dispatched kitchenward. By means of a flexible cord and plug and a set of jacks, one for each of the 19 floors, the kitchen service dumbwaiters may be dispatched roof-ward *and caused to stop at any floor automatically*, simply by inserting the plug in the jack corresponding to that particular floor. When the meal is ready, one of the room service waiters stationed on your floor serves the meal in your room, and invariably of course, a table has to be provided for this purpose. Eventually, we presume, the servidor idea will be extended and amplified, so as to permit the serving of meals, altho this is questionable for the reasons already stated.

Returning toward the lower regions of the hotel, my guide piloted me down a long hallway on one of the lower floors, and we inspected the children's open-air playground, arranged in one of the large courts of which there are several, and ended up this part of our inspection trip, by looking over the large ladies' and gentlemen's "plunge", provided with large deep pools, and every convenience imaginable. The "plunge rooms" in general are provided with steam rooms, hot rooms, massage and silent rooms, drying and rubbing rooms, etc., while the women's plunge apartment contains specially fitted dressing and rest rooms, as well as a manicure and hair-dressing parlor and chiropodist.

Just as we were leaving the plunge rooms, we were surprised by seeing two nurses passing down the hall just ahead of us. Upon inquiry we found that the hotel management had not even overlooked such a possibility, and one to be conjured with when such a large number of guests are considered. Not only was it surprising that the hotel should include a "hospital," but it also developed that there is a physician always present. Thus the guests have always available hospital and medical attention for any emergency. Of course, for any protracted illness, the patient would have to be transferred to one of the regular city hospitals. One does not even have to leave the building in order to get a prescription filled, as there is a large and complete drug store on the street floor, which is accessible from the interior.

In various parts of the hotel, where the architects have found room for them, one suddenly bumps into unsuspected scenes of activity. On some of the lower floors, as well as in spare rooms on the roof, one finds carpenter shops, painters and decorators shops, an up-to-date upholstery shop, yes, even a silver-plating room (for taking care of the vast amount of silverware used in the dining rooms), employees' club rooms, plumbers shop, etc., etc.

A few words may be said here concerning the elaborate kitchen equipment at these hotels, and it is indeed a great revelation to see how cleverly the engineers who designed these departments have worked out their problems. For example, all the soiled dishes from any of the dining rooms are practically never touched by human hands, after once being removed from the dining tables. They are placed in metal carriers resembling large drip pans as soon as they pass the dining room service door. Here they are placed on continuous moving platforms, which travel along at a constantly changing angle, so as to utilize the power of gravity, and eventually the dishes reach the dish-washing department, which is quite an establishment all by itself. The dishes are washed by plunging them into large tanks filled with steam and boiling water. Every germ is thoroly killed as soon as he hits the tanks, and the dishes are then rinsed in other tanks filled with boiling water, which is so hot that the dishes are dried as soon as they emerge from the tank, due to the rapid evaporation of the water vapor remaining on them. The clean dishes are then whisked away on another continuous moving platform, which takes them back to their respective kitchens. The scenes in these great kitchens are ones that you will not readily forget, once having visited this important department of the great hotel organization. Here we see dozens of French chefs preparing the various meats and cooking them. It would be a great revelation to any housewife to see how rapidly the cooking is accomplisht. Steam, gas and electricity are used in the various ranges and stoves used for cooking the various foods, and there is a special kitchen fitted with all electric ranges and stoves, which is called the "home cooking kitchen". This kitchen is one of the features of the "Pennsylvania" and is in charge of an expert dietician. Any guest who has gastronomic trouble or for other reasons may desire to have a piece of pie "like Mother used to make" with its full quota of calories and other toothsome units, can have just what his stomach craves. When the writer visited the kitchen, it was near dinner time, and the chefs were busy cooking squabs by the hundreds in the gigantic ranges, chops by the same number, and steaks by the dozen, not to mention French-fried potatoes by the bushel. Other activities of the Culinary Department include ice-cream making, pastry and candy making, etc., etc. One of the most wonderful sights in this important section of any hotel, and particularly in this giant of all hostelries, is the storage room, where wagon-loads of vegetables are kept, not to mention several auto-truck loads of meats and fish. Large, thoroly ventilated refrigerators, kept cold by the ammonia compressor plant operated by the hotel, maintain a constant degree of cold in them.

Of course, there are the usual wine cellars, one of which extends the whole block, not to mention large rooms filled with snow white linen, shining silver and glassware and crockery, enough to stock an average department store.

ELECTRICITY!

HERE'S just the book on Electricity that you need to answer your many questions—to solve your knotty problems, to teach you new kinks, to be your memory for tables, rules, formulas and other Electrical and Mechanical facts that some people try to carry in their heads—and fail.

With this "Little Giant" I. C. S. Electrical Engineer's Handbook in your pocket, toolchest, on your work bench, drawing table or desk, an hour or a day need not be lost "digging up" some forgotten rule, some unfamiliar fact; you'll just turn to the very complete index and get it "in a jiffy." Just a few of the subjects treated are:

Electricity and Magnetism; Electrical Symbols; Batteries; Circuits; Magnets; Direct and Alternating Currents; Dynamos and Motors; Belts; Shafting; Electroplating; Electrical Measurements; Meters; Arc and Incandescent Lamps; Mercury Arc Rectifiers; Transformers; Insulation; Electric Cars; Single and Multiple-Unit Control; Transmission; Rail Welding; Tables of Wires—Sizes, Capacities, etc.,—Mathematical Rules; Formulas, Symbols; Tables of Constants, Equivalents, Roots, Powers, Reciprocals, Areas, Weights and Measures; Chemistry; Properties of Metals; Principles of Mechanics; First Aid, etc.

The Electrical Engineer's Handbook is one of 22 I. C. S. Handbooks covering 22 Technical, Scientific and Commercial subjects. (See titles in coupon below.) They have the contents of a full-size book condensed into pocket-size ready to go with you anywhere and be at your instant command. Substantially bound in cloth, red edges, goldleaf stamping, printed from new, clear, readable type on good quality book paper and illustrated wherever a picture will help.

No Risk Money-Back Offer!

The price of the famous I. C. S. Handbooks, of which more than 2,000,000 have been sold and are in practical everyday use, is $1 per copy. So confident are we that you will find them exactly what you need for ready reference in your work, that we stand ready to promptly and cheerfully refund your money if for any reason you are not fully satisfied with their value. Simply send a letter or the coupon below, enclosing $1 for each book wanted. If at any time within 10 days you wish to return the books, your money will be refunded.

Mesco Telegraph Practice Set

For Learning Telegraph Codes

The Practice Set comprises a regular telegraph key, without circuit breaker, a special high pitch buzzer, one cell Red Seal Dry Battery, and four feet of green silk covered flexible cord.

The key and buzzer are mounted on a highly finished wood base, and three nickel plated binding posts are so connected that the set may be used for five different purposes.

List No. Price

342 Telegraph Practice Set, with Battery and Cord.....$3.24

Weighs 4 lbs. packed.

Price does not include postage.

MESCO Combination Practice Set for learning the Morse and Continental Visual and Audible Codes

This outfit is the only reliable instrument which will enable students to become proficient operators in the U. S. Naval Service, because it is equipped with a buzzer and miniature lamp enabling the user to master both the visual and audible signals quickly.

List No. 52—Practice Set with Red Seal Battery and Cord.....$4.05

Weighs 4 lbs. packed. Price does not include postage.

SCIENCE IN SLANG.

(*Continued from page* 911)

the wireless more of a success, but who have not had the public notified that they pulled a good one.

"Old Doc. Fleming got a good one in the form of a 'valve,' which is a lot like the audion. It was a close second in the patent office and only lost first place by much wrinkles and perspiration on the part of a wise old judge who weighed the proposition like a pair of assayer's scales.

"Then suddenly just when we kiss the dear old war good-bye, in drops old man Jimmy Rogers. He steps up on the platform, puts up his hand and says, says he: 'Sh, boys, before you put up your aerial zingmagics, see me! Nix on those aerial wires!' We say: 'Thehellusay. Whazzematter with our good old aerial?'

"'Not much,' says Jimmy, 'except that aerials are all wrong. Besides you don't need 'em. Just you take a hundred feet of rubber covered auto cable and bury it three feet underground into a trench, savvy? Hook the loose end to what was once your aerial connection and, presto, in come the messages louder'n a goat on a tin roof. *And* you receive *twice* as far as before, AND the old girl static, who used to tease the life out of you, is gone for good, along with the war. Simple, if you know how!'

"I guess that is about all for to-day—now for tomorrow. We may be able to carry around in our pockets a 'phone that will enable us to talk to our colored friend in Africa—when we are in Siberia or Sing-Sing. The present wireless is a great success—so was the Roman chariot, but the Handley-Page aircraft has it over the old go-cart in more ways than altitude.

"Where are we in the art of cultivation? We thought that we had it down like a scenario until Luther Burbank showed us that cactus did not have to have their stickers and the little posies that we wear on our coat lapels could aspire to the rainbow. Way back in the old ignorant days, when a gink thought that it was no worse to marry his sister and raise a colony than we consider a divorce or Wall Street play, there lived an old bird who observed that a little hoeing and so forth would not hurt a wheat stalk and that other growths were helped thereby. I don't remember the guy's name—it was so long ago—but it seems he was an Egyptian. I would not say for sure though.

"Now look how long ago it was when we got out of the boyhood stage in the electrical game—there are a string of years ahead of us yet—perhaps some electrical Burbanks will show up. Don't get it in your head I am slighting Edison, Tesla, Steinmetz, Marconi, De Forest, Fessenden, and others who now have the WATT under the microscope and wearing their glasses at that. What would Caesar have done had he possest a machine gun or a telephone—what would Edison do with the observations and discoveries of the years to come? Men, we are moving! Moving as men have never moved before!"

PREPARED TO DELUGE GERMANS WITH GAS.

Statements that America next spring would have smothered the German front with undreamed of quantities of poison gases, that Edgewood Arsenal thru gas production would have brought about the capture of Metz, that America alone would have had ten tons of mustard gas to Germany's one, and that our chemists had surprises of which German scientists never dreamed—all these facts were recently disclosed by the War Department.

Colonel Bradley Dewey, who was in charge of gas defense production, said that a mask had been evolved which required no nose clip and no piece in the mouth. A man could wear it indefinitely and could sleep in it.

DO RADIO WAVES TRAVEL ABOVE THE EARTH OR THRU IT?

(*Continued from page* 872)

stalling later stations under such conditions, to examine very carefully the topography or rise and fall of the country over which this radio system was to operate. Fig. 5 shows a more ideal condition for the operation of a radio station in a valley, and one which has proven to be entirely successful in practise. Here the surface waves have a chance to follow the contour of the ground, as shown, and the antenna in consequence receives a full quota of energy from the waves as they pass across it. It is conceivable in the case illustrated at Fig. 4 that the etheric space-wave component at B, may become totally a space wave without a grounded foot, and this would account all the more readily for the station in this case not receiving any signals.

Some very interesting experiments were made some years ago on the relative efficiency of *ground antennae* and which were reported in the journal *"Jarbuch Für Drahtlose Telegraphie und Telefonie"*, and the essence of these tests is illustrated diagrammatically at Figs. 6 and 7. The investigator, Kiebetz, working with such antennae, utilized one form composed of insulated conductors placed in an open trench, as shown in Fig. 6, and later he covered the trench over with boards and piled soil on top of it. The more soil he placed on top of the trench, the weaker the signals became, until finally *none were received at all.* This showed apparently that if wireless signals were to be received by an ordinary ground antenna, it must be placed in close proximity to the earth's surface, as I have already described in the opening part of this article, or else in a more or less shallow trench, the top of which is open and not covered with any conductive substance or material. The diagrams, Figs. 6 and 7, show how the gliding composite waves, with their ground components, cut across the antenna wires in the open trench, while in the closed trench, the ground waves or "feet" glide over the raised contour of the soil as shown, and how the ground components, reaching but a short distance below the surface as previously explained, do not cut across the buried aerial conductors, and therefore no currents are generated in them, as the tests prove.

One way in which a submarine may pick up wireless messages is shown at Fig. 8. Here the composite radio waves glide over the water with their ground components, as shown by the dotted lines. Now, if the submarine trails a heavily insulated wire, as shown, the upper end of which is supported on two or more floats, then it naturally becomes possible for this wire to pick up energy from the radio waves travelling in the direction of the wire, and signals will be received. As mentioned above, it is also possible, that by having the floats partly weighted so as to keep the antenna wires a short distance below the surface of the water, that wireless messages can then still be picked up, due to the partial penetration of the grounded components of the waves into the water, in a readily apparent manner. It is very doubtful if the submarine will be able to pick up any radio messages, if it lies at any considerable depth in the water, say below 50 feet, with the antenna wire trailing along behind it, as the penetration of the wave base has been shown to be usually but a few feet below the surface, especially over salt water. It must be clearly understood, however, that experiment as well as theory both show that the penetration into moist earth or water *increases with increasing wave length.* Hence it is that of late, as the wave lengths

TWO TYPES OF MICA TRANSMITTING CONDENSERS SUITABLE FOR MODERN AMATEUR APPARATUS. 21000 VOLTS. .004 MFD.

Make Your Wireless Apparatus Send Further
Last Longer and Work Better

The wireless amateur and experimenter is once more busy constructing apparatus for use the moment that orders go forward allowing amateur stations to open.

The kind of apparatus you used before the war doubtless answered your purpose nicely, but just consider the tremendous advancement made in the art during the past two years and you will appreciate your modern apparatus must contain several new types of equipment to bring it up to date.

DUBILIER
MICA CONDENSERS

proved their real worth in the Navy, the Signal Corps, and as a part of the equipment of the fighting Airplanes both here and abroad since 1916.

You can now purchase a genuine DUBILIER MICA CONDENSER for your new set for any voltage and capacity. They replace Leyden Jars with greater efficiency and without brush discharge and with negligible losses. They are compact and indestructible.

Made in any capacity and up to 1,000,000 volts. Special condensers supplied for experimental work.

Used in practically every Government installation.
DUBILIER MICA CONDENSERS are now ready for your use.

	Type A	Navy Type
.002—21000 volts.....	$11.00	$18.00
.004—21000 volts.....	20.00	35.00

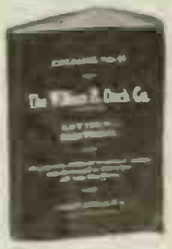
Boys! You Can Make Your Own Electrical Apparatus with the aid of these wonderful books
Home-made Electrical Apparatus
By A. M. Powell

Three wonderful big books, chuck full of just the sort of information you have been looking for and at a price within reach of your pocket book. Each volume is printed on heavy paper, contains 75 pages and over 60 illustrations, complete working drawings for making every sort of electrical apparatus. Written so you can understand them. The price is only 25 cents per copy—practically the cost of publication. See partial table of contents below and order now. The supply is limited.



Vol. I Contains *working drawings* and directions for making all sorts of Static Machines, Static Apparatus, Home-made Batteries, Storage Cells, Transformers, Rectifiers, etc.

Vol. II contains *working drawings* and directions for all sorts of Voltmeters, Ammeters, Galvanometers, Switches, Rheostats, Telegraph Keys, Sounders, Telephones, Shocking Coils, Spark Coils, Experiments, etc., etc.

Vol. III contains *working drawings* and directions for making all sorts of Dynamos, Motors, Electric Engines, Miniature Lighting Plants, Wireless Telegraph Apparatus, Tesla Coils, Wireless Telephone, Electroplating, Experiments, etc., etc.

Any of these wonderful books will be sent to you *postpaid* for 25 cents.

Everything in wireless *worth while* is listed in this catalog. The experienced amateur will tell you to see our catalog before buying. You are thereby insured against an unwise purchase. It is the *Beacon Light* to guide you right in the selection of your wireless apparatus. No bigger or better values are obtainable elsewhere.

If you have our catalog No. 11, you have our latest catalog. Do not write for another. Send for a revised price list. It is yours for the asking.

THE WILLIAM B. DUCK CO., 230-232 Superior St., Toledo, Ohio

of the larger stations have been increased, these horizontal receiving antennae can be sunk deeper and deeper before effective screening is observed. Hence the periodic "rediscovery" of the astonishing efficiency of the horizontal receiving directive antenna.

So far as I have heard the first use of the horizontal receiving antennae was at Block Island in July, 1903, where we connected the receiver direct to a telephone line running across the island from the wireless station towards the Point Judith (R. I.) transmitter. Fine loud signals were thus received.

In 1905 I used a bare copper wire lying directly on the ground at New Haven, and then determined within a few degrees the direction of the transmitting station, by swinging this wire around a circle, the center of which was the receiving instrument and ground stake. The signals were loud when the wire lay in the plane of the station, in *either* direction to or from the station—practically the same for both. But when at right angles to this plane of propagation nothing at all was received.

But to return to your editorial, "Wireless Around the World", it is highly unfortunate that the esteemed advertising propensities of the Marconi interests should have made capital over this performance of their station in the year 1918, when similar performances had been on numerous occasions a matter of record for at least two years prior to that date.

I give below a news clipping sent to me back in 1916 by a wireless operator at Awarna, New Zealand, which is self-explanatory. I have received many communications from this section which, unfortunately, I have not felt authorized to publish, recounting similar "anti-podal" radio-transmission.

"In connection with Commander Cresswell's statement regarding the reception at various Australian wireless stations of messages sent out by Nauen and other places in Germany, it is stated that similar messages are received nightly at several of the New Zealand radio stations, especially Awarua, which is probably the best equipt in the Dominion. The distance from Nauen to Awarua is about 12,000 *miles, which, if it does not constitute an absolute record, is very near it. The secret of these remarkable results which in less troublous times (referring to the World War) would excite world-wide interest, lies in the De Forest ultra-audion receiver—one of the most remarkable and simple pieces of apparatus invented since Marconi's first experiments. Dr. de Forest is an American, who lives at New York. His "ultra-audion" has the power not only of receiving the far-flung waves, but can also be used as a wireless transmitter for the voice—a field as yet practically unexplored."*

In fairness to facts wherever an epoch-marking feat of this sort is accomplisht, whether in science or in any field of discovery, I am sure you will agree that it is highly important that due credit should be given to the *first* performance and not to a repetition which happens to be generously advertised years thereafter.

Perhaps your article lays unwarranted stress on the improvements which the Alexanderson alternator today enjoys over the arc transmitter. After witnessing what the big arc transmitters are doing in Europe, as well as in the United States, together with their simplicity and ruggedness and the facility with which any wave length can be instantly obtained, it is doubtful in my opinion whether the alternator will soon supplant the big arcs; at least, except in stations where one wave length only is required.

ELECTRICITY IN FAR-AWAY BOMBAY.

The great success with which the introduction of electric power from the generating station on the Ghats is being developed in Bombay is revealed by the report of the Tata Hydro-Electric Power Supply Company. The energy now being supplied to motors in Bombay amounts to 48,000 horsepower. Thirty-six mills are receiving power, and only the difficulties arising from the war prevented development being more rapid.

THE HOW AND WHY OF RADIO APPARATUS.

(*Continued from page* 875)

them in the proper manner for giving a good indication. At this point, it is well to mention that no matter which form of detector is used in conjunction with the wave meter, that the wave meter itself must be kept at a sufficient distance from the exciting circuit, no matter what its form or make-up, so that there shall be just sufficient current picked up by the wave meter oscillating circuit to give a good clear indication in the detecting or indicating device. If the wave meter is held too close to the exciting circuit, then several wave lengths or harmonics of various wave lengths may be heard, and an incorrect reading obtained.

For many purposes it is desirable and necessary to excite the wave meter so that it will radiate a wave length of known value, such as in various radio measurements, etc. Fig. 5 shows a standard method of exciting the wave meter. Here we have a high note or other form of buzzer connected with a few cells of dry battery, and a key or switch. This circuit is shunted across the variable condenser of the wave meter as the diagram indicates. This arrangement will cause oscillations to be set up in the oscillatory circuit of the wave meter, and an auxiliary inductance can be placed near the wave meter inductance so as to link the two inductively, and thus transfer the energy electro-magnetically from the wave meter circuit to the auxiliary circuit, and which energy shall have a wave length and frequency of known value.

At this juncture, the matter of arranging the wave meter cabinet, and especially the variable condenser and its scales, etc., should be considered. In this connection we may refer to Figs. 6, 7 and 8, wherein several important and simplified methods of arranging the variable condenser scales, especially direct reading scales, are given. Fig. 6 shows a method used by the writer for several years with good satisfaction. In the scheme the variable condenser scale is specially made up on heavy bristol board or celluloid, (or else hard rubber with the graduations scratched in with a scriber and then filled with Chinese white), and instead of having simply the angular spaces marked off in degrees, and then having to refer to a calibration chart in the usual way, the corresponding wave length values for the coil are read off from the calibration chart (see Fig. 9) and marked off on the scale as shown in Fig. 6. Then as the indicator attached to the variable condenser knob is moved over the scale, and by noting which inductance coil is in use at the moment, the corresponding wave length may be read off directly as soon as the maximum resonance point is indicated by the detecting circuit. The indicator, Fig 6, comprises a piece of heavy sheet brass, soldered or otherwise secured to the shaft of the variable condenser, and the outer end of the arm is cut to the form shown, with the two side edges bent over to retain a piece of ordinary glass. With a glass cutter, a straight line is scratched across the center of the glass, and this may be darkened

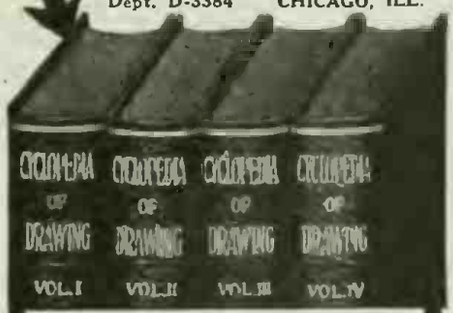
Draftsmen Earn $35 to $100 Weekly!

DRAWING

You can get this big pay. All you need is the new 1919 edition of the Cyclopedia of Drawing and a little of your spare time. The cost is only 7 cents a day. You learn at home and pay this small amount while learning. See the FREE EXAMINATION offer below.

Architectural and Mechanical Drawing

4 big volumes each 5¼x8¼ in., bound in genuine American Morocco and trimmed in gold. 1578 pages and over 1000 illustrations, plates, diagrams and blue prints.



The only books that thoroughly cover Mechanical, Structural and Architectural Drawing in a non-technical way. You don't have to know anything about the subject to understand them. They begin at the begining and tell you everything about Blue Print Reading—Mechanical Drawing—Machine Design—Machine Drawing; Structural Drafting; Architectural Drawing ing and Lettering—Shades and Shadows—Perspective Drawing—Freehand Drawing—Pen and Ink Rendering—Typographical Drafting—Drawing Instruments and Their Uses and hundreds of other things connected with the work.

Use One Week FREE

You can use these books for a whole week free without sending one cent. Just send the coupon below and all 4 volumes will come to you at once by express collect. Use them as if they were your own—go through them thoroughly and send them back at our expense if you don't want to keep them. If you do keep the books send us only $2.00. You can send the balance of our special introductory price—only $13.80 the same way—**$2.00 each month.**

Remember you don't take any chances. The risk is all ours and the benefits will all be yours. SEND THE COUPON TODAY.

American Technical Society
Dept. D-3384 CHICAGO, ILL.

if necessary with a little black pigment. A piece of fine wire can also be drawn across the glass and soldered in place.

Fig. 7 illustrates a clever arrangement which also provides a direct-reading wave meter, and here the calibrated dial corresponding in its lay-out to that shown at Fig. 6, is secured to the variable condenser shaft *below* the shelf of the cabinet. A small oblong window is cut thru the cabinet shelf as shown, and a brass slide is placed underneath this shelf so as to be readily operated by hand, in such a way that the small window cut in the slide can be slid into any one of three positions, depending upon which scale and which inductance is being used at the moment. Fig. 8 shows an automatic arrangement, which is easily made by the radio student and whereby each of the three inductances is fitted with pin contacts, one of the pins in either case being made of a different length for each of the three coils. As each inductance is placed in the cabinet thru the spring contacts shown, the longer lug will actuate a lever system connected to the window slide shown at Fig. 7, and thus automatically move the slide to the proper position to read the corresponding wave lengths for that coil.

The calibration curves for the wave meter here described are given at Fig. 9. These values can be transposed to a special variable condenser scale if desired, of course. The variable condenser calibration curve is given as well as the wave length graph for each of the three inductances. As is well known, the capacity of a condenser may be increased by adding a liquid dielectric, such as *castor oil*, which has a coefficient K value of 5; or in other words, if the variable condenser is filled with castor oil, its capacity will be increased five times over that of air. The capacities for the condenser filled with castor oil (as well as air dielectric) are given at Fig. 9 on the right. Also in this way the student will have a greatly increased wave length range on the wave meter for any given coil, when the condenser is filled with castor oil, as the second column of wave length figures on the left indicates. The manner of using the calibration graphs is as follows: Consider that a maximum resonance point is indicated by the detecting instrument connected to the wave meter circuit, when the condenser needle stands at 105 degrees, with the 24 turn inductance in use. Glancing upward from the 105 degrees marked at the base of the chart, and noting the point where this line intersects the curve for the 24 turn helix, we find that the equivalent wave length for air dielectric in the condenser is 500 meters, and for castor oil in the condenser 1115 meters.

Calibration Curves for Wave Meter and Variable Condenser Here Described. To Read Any Wave Length Value from These Graphs, Note the Condenser Reading at Which Resonance is Indicated. Then Determine the W. L. Value Corresponding to the Intersection of the Vertical and Horizontal Lines with the Proper Inductance Graph, Fig. 9.

Direct-Reading Decremeter—The chart shown at Fig. 10 is described in a recent book entitled "Radio Instruments and Measurements," Circular No. 74, issued by the United States Bureau of Standards, and a copy of which can be obtained from the Government Printing Office, Washington, D. C., at small cost. This chart makes a *direct-reading decremeter* out of any wave meter. Fig. 10 shows how the chart may be attached to the upper rotary plate of the variable condenser; its zero graduation being set to coincide with an indicator mark or hair line thru a window in the top of the condenser case, when the rotary plates are all the way out from the fixt plates. Also it should be seen that the hair line in the window coincides with the straight edge of the semi-circular fixt plates. Full description of this arrangement is given in the work above referred to, as well as all the usual methods of measuring decrement.

Health In A Glass Tube

The interesting story of a man "too busy to bother" who appreciated perfect health, energy and vitality only after he lost it—and how he won it back in a startling way

By FRANK HARTLE

YOU probably know dozens of people like my friend John Brainard. Strong, robust, a human dynamo for work, a real bulldog for stamina, and a very likable fellow in spite of his entire lack of sympathy for sickness and sick people. He regarded sickness as a mild sort of crime and had such faith in his own excellent health that he had about as much sympathy for sick people as, according to Mark Twain, David had for Goliath. If you happened to mention that you didn't feel extra well Brainard would say, as courteously as was absolutely necessary, "T'bad, very sorry"—and you could almost *see* the entire matter sail out of his other ear. Sickness and suffering were foreign to John Brainard and he couldn't understand it in other people, that was all.

But as Josh Billings once said, "Health is like munny. We never hav a true idee uv its value until we lose it." And quite suddenly John Brainard realized what ill-health is. Too much overwork, inconsiderate hours, immoderate meals, and general inattention to his health finally "told on him." One day I went to his apartments and found him in bed with a severe attack of sciatica, but fuming with rage in spite of the intense pain. "Why should I have this?—I've been as healthy as a horse all my life. Why should *I* be sick?—hang it, I *won't* be sick," and he jerked himself to a sitting posture only to fall back in pain upon the pillow.

For a week John Brainard lay in bed in intense agony. Those of you who have suffered from acute sciatica or rheumatism know what it is. The doctor came and went, but Tuesday and Friday when I called, John only said, with a weak attempt at his former cheerfulness, "Nothing doing, Frank. They haven't pushed the right health button yet. Who was that fellow anyway who said something about 'a man too busy to take care of his health is like a mechanic too busy to take care of his tools.'"

Next day while at lunch with George Conrad, our mutual friend, I mentioned about John's still being so very ill. "Listen, Frank, old boy," he said, "I don't want to be presumptuous or anything like that and I certainly believe that the Doc will fix John up fine, but there's a treatment which entirely cured my wife of chronic neuralgia, and now it's bringing total cure to my cousin, another sciatic sufferer. I think if John would give it a trial it might help him some." Ten minutes further conversation with Conrad convinced me and I went right over to John's home to "spring it."

"John," I said quietly, as I tip-toed into his bedroom, "I've got the very thing. Conrad has given me some real facts about what electric violet rays are doing for people and I think—"

"Oh," he interrupted, "I don't know. I don't imagine it can help me."

"Of course you don't know. And you never *will* until you try. Now don't talk foolish, Johnny, old scout. Won't you even believe your friends? This violet ray treatment has *proved* what it is."

And then I went on to tell him all I had learned about violet ray treatment—how it had been invented by the great Tesla in 1890, how it was being used with wonderful success by eminent physicians all over the world, how he could use it on himself and it wouldn't shock him like electricity in other forms, how it would surely at least *help* his own sciatica when it had *cured* other folks' sciatica, neuralgia, hay fever, asthma, neuritis and dozens of other diseases, and finally I told him how it would bring back to him his old "pep," vigor, and "knock-'em-dead" vitality. Then John rolled over and said, "All right, if it brings me out of this blamed bed a well man I'll swear by it for life. Cart in the dynamo, or whatever it is."

"When I ran that glass tube over my 'hide'," said John, "it felt just like a local anaesthetic on a wild tooth."

"Its nothing of the sort," I insisted. "It's a handy little tube-shaped thing that attaches to that electric socket right over your head. And you can apply it yourself right to your 'hide' without feeling a bit of a shock."

Three days later I had gotten a violet ray instrument from Chicago and John used it on his legs and thighs. "Say," he cried, after the first treatment, "I thought electricity always shocked a fellow. Why, when I ran that glass tube over me and the violet rays flashed around, it just felt like a local anaesthetic on a wild tooth. If this keeps up—oh, boy!"

John Brainard got up for good three days ago for the first time in over two weeks. Five days' treatment with the violet rays put him on his feet.

"Where is your 'rheumatiz,' John," I remarked yesterday.

"Dunno, Frank, I can't find it anywhere. It just 'violet-rayed' itself away, I guess," he said, pointing to the instrument in the bathroom.

"I see you keep it attached."

"Yes, you see my wife discovered that the best beauty specialists in town used it, and she—well, my wife's a woman you know."

* * * * *

Violet rays have brought *good results* in almost every disease and Violetta, being the most advanced instrument produced and selling many thousands ahead of all others, is certain to bring you the health-giving results you have always wished. But we do not want you to take our word for it. Judge for yourself—try it for ten days in your home before you decide one way or the other.

Now, through the Violetta, you can have in your own home, the wonderful violet-ray treatments exactly as given by eminent physicians and beauty specialists throughout the country. Now you can rid yourself of Chilblains, Colds, Corns, Constipation, Dandruff, Deafness, Eczema, Eye Diseases, Hay Fever, Headache, Goitre, Insomnia, Lumbago, Nervousness, Neuritis, Obesity, Paralysis, Piles, Pimples, Pyorrhea, Rheumatism, Skin Diseases, Sore Throat, and many other ailments.

Multiply your bodily health—vitalize your nerves—double or treble your energy and vitality. Sleep better, increase your strength, improve your appetite and digestion. Soothe your nerves, reduce or increase your flesh, tone and strengthen the entire system, beautify your complexion. All with the Violetta.

Trixie Friganza, the famous actress, says, "Cheerfully will I add my praise for Violetta. It's the best 'pain chaser' and 'soother' I've ever had the good fortune to find. It's wonderful. It cured my brother of neuritis. As for myself, I use it for facial treatments and general massage. I cannot say too much for it." Frank Borzone, of Seattle, Washington, says: "I purchased the Violetta for my wife who was suffering from an acute attack of sciatica. From the very first treatment it induced peaceful rest and she is entirely well now." Scores of letters like these are received each day.

The Violetta is not a vibrator. It is not a machine that contracts the muscles—it does not shock—it does not pound the muscles—it is absolutely painless.

Eminent physicians from all over the country apply the Violetta with wonderful results. Dr. Bert H. Rice, of Vinton, Iowa, says: "I have good results with the Violetta. Almost instant relief in Facial Neuralgia." Dr. Daniels, Lisbon, North Dakota, says: "Have used the Violetta in such cases as Goitre, Bronchitis, Pleurisy, Neuritis, Neuralgia and Lumbago, and find it very beneficial. In fact, I would not be without it in my office." Dr. G. B. Duncan, Kewanee, Ill., says, "The Violetta is the finest thing I ever used to relieve congestion in any part of the body; and to relieve pain. Treatments are so pleasant that all of my patients like it."

Write today for a very interesting little booklet explaining fully about the Violetta and how you can try it for ten days before you decide. Read some of the amazing results produced in almost every disease. Read how the Violetta can be attached to any electric socket and also used where there is no electric light. Read how this little instrument, shaped somewhat like a thermos bottle with a glass tube and bulb at the end, pours electric energy and vigor into every muscle, fibre, cell, and pore of your body, read how you do not have to obligate yourself in any way until the Violetta has proven its value in your particular case.

Write for this interesting booklet now. Fill out the coupon printed below for your further convenience, *and mail at once.* Address, Bleadon-Dun Company, Dept 2C, 11 So. Desplaines St., Chicago, Ill.

CUT YOUR OWN HAIR

If you can COMB your hair, you can CUT your own hair with this marvelous invention. You can cut your hair any length you desire, short or long, and finish the job as nicely as any barber in one-fourth the time before your own mirror, with the

UTILITY Hair Cutter

You can keep your hair well trimmed for a lifetime with this marvelous invention for actually **less than any good barber would charge you for a single hair cut.** Very easy to manipulate. Use it just like a comb, pushing it through the hair, downward, in the direction the hair lays. It is impossible to leave any "nicks" or "cat steps" in your hair, as there is a special Guard that guides the cutter blade evenly over the scalp.

35c POSTPAID

Extra Blades: **5cts. Each** **50c the Doz.**

Cut Children's Hair

at home and save time, trouble and expense of taking them to the barber shop. It works so easily and the job is done so quickly that the children enjoy having their hair cut. The adjustment feature, whereby the blade can be set to cut the hair to any desired length—short, medium, or long—makes it possible to do as perfect work as the barber, not to mention the tremendous saving.

As a Safety Razor You can use the Utility Trimmer as an ordinary Safety Razor, and it will give you as good a shave as the most expensive Razor you can buy. You can shave the face or neck, or finish around the temples.

EASY TO HONE AND STROP BLADES

No trouble at all to keep the blades sharp. Just reverse the blade in the holder and proceed to strop as with an ordinary razor. Extra Blades are always obtainable and cost only 5 cents each, or 50 cents the dozen.

USEFUL FOR MANY OTHER PURPOSES

There are many other uses for the Utility Cutter that will suggest themselves to you. Ladies use it for removing hair from under the arms and elsewhere. It is perfectly safe, and cannot cut the skin. One customer wrote us that he found it just the thing for cutting corns, while housewives and dressmakers say there is nothing better for ripping seams and making buttonholes.

AGENTS AND DEALERS GET OUR PROPOSITION

This is one of the rare occasions when you are able to connect up with a really "Sell on Sight" article. Something that every man and woman will buy on sight, because it actually saves them money. Agents are coining money. Why not you? Handsome package, weighs but a trifle. Write at once for terms on the Trimmers and extra Blades.

SEC'Y DANIELS TALKED BY RADIO TO PRESIDENT WILSON AT SEA.

Secretary Daniels transmitted a telephonic greeting to President Wilson at sea by naval radio on February 22. From his desk at the Navy Department the Secretary's voice was carried to the transport George Washington, nearly 800 miles off the Atlantic coast.

The long-distance radio telephone equipment had been set up when Mr. Daniels reached his office. With Rear-Admiral Griffin, Chief of the Bureau of Steam Engineering, and Commander Hooper, the radio expert of the bureau, supervising the experiment, the Secretary's regular desk telephone instrument was connected up thru the telegraph wires to the transmitting station at the seacoast, where his voice was projected by radio waves to the aërials of the George Washington.

The Secretary said a great welcome waited the President in Boston and again in Washington when he reached the Capitol.

Mr. Daniels repeated his sentences several times to make sure that he was understood.

"Good-bye," the Secretary said into the instrument. "I will see you Tuesday. Good-bye."

GRAND OPERA IN YOUR HOME.

(*Continued from page* 855)

microphone circuit could be loaded simultaneously with such an immense number of lines which practically constitutes a short circuit, and while the thing is possible in a limited way by means of induction coils, not more than two or three hundred subscribers could be linked up by such means. Therefore, the system heretofore was a failure.

The invention of the Audion, however, has changed this and by using audions to "boost" the circuits, it is now possible to connect a practically unlimited number of lines to one microphone transmitter and reproduce the music clearly in 50,000 homes at the same time.

The writer who interviewed high telephone officials was informed that the plan was entirely feasible and there was only one objection, which is not of a technical nature but rather a commercial consideration. Thus, the telephone engineers did not think it good business to tie up say twenty thousand to fifty thousand lines simultaneously for several hours at a time on account of the congestion that would probably ensue, but this is really only a small consideration and not of much importance if the enormous revenue that the companies will derive from this scheme is taken into consideration. While the subscribers now pay only between two and five dollars a month for service on an average, the telephone company could easily double this revenue for at least 20 per cent of all of their subscribers by installing the operatic service.

Today the man who owns a phonograph thinks nothing of spending between three to five dollars a month for records which are "dead". If he knew he could hear Caruso, Galli Curci or any of the other stars tonight in one of his favorite operas, he certainly would not object to spending 50 cents or even a dollar for the privilege, and at that he would think he was getting it cheap because he, with his entire family, would hear the music in his own home, without having to travel to and from the opera. Of course, if the system eventually comes into vogue, the opera alone will not be the only source of amusement to be drawn up by a telephone subscriber. Any of the musical shows or comedies, farces, etc., could all be heard over the telephone, altho admittedly not to such an enjoyable extent as grand opera, where it is the music that counts most.

www.americanradiohistory.com

As for the technical aspect, we now have very good sensitive microphones, which placed about the stage and orchestra transmit the sounds strongly and faithfully. The microphones are then connected thru the audion switchboard, similiar to the one shown in the lower center of our illustration, which is the identical audion switchboard now used in multiplex telephony where five conversations are held over the same wire. From here the circuit runs thru the telephone exchange shown in the upper center of the picture, whence the circuit enters the subscriber's home as shown at the left of our drawing.

Here we have a novelty suggested by the writer. In transmitting music over the telephone heretofore, it was not possible for more than one member of the family to listen to the music as there was only one telephone receiver. By means of modern loud talking telephones, however, it now becomes possible to lift off the telephone from the hook and place it over a sensitive transmitter, as here illustrated. The weak sounds picked up by this transmitter are strongly amplified and projected from the horn in great volume. Thus, it becomes possible for any one in the room to hear the music clearly and almost as loud as we do sitting in one of the further rows in the opera, where the hearing is not always good, as is well known.

As for the subscriber's amplifier as shown in our illustration, this may be made of the ordinary loud talking variety, having a simple hyper-sensitive microphone connected to a loud talking telephone, or otherwise it may be a microphone connected to an audion amplifier. The latter probably is the better of the two systems.

The amplifying cabinet can be hung near the telephone, in case of a wall set, or otherwise it can be of a different shape for table use if the telephone is of the portable type. The amplifier could be sold outright to the subscriber or otherwise rented to subscribers by the telephone companies.

We feel confident that a plan similar to the one outlined here will soon come into general use, as there is a positive demand, particularly in America, for good music and which demand as yet has not been satisfied.

But like all other large interests, the telephone companies are slow moving organizations and do not make innovations unless they know that a large part of the public actually wants them. Therefore, if you are in favor of this plan, we think it would be a good idea to write the headquarters of the telephone company, advising them what you think of this plan. If, however, you were to write to your local telephone company, not much impression would be made. If, on the other hand, you address your letter to the American Telegraph and Telephone Co., No. 12 Dey St., New York City, then there is a chance that a national movement would perhaps result from such letters. Local telephone companies cannot make a change in their present system as they are governed by the policy which originates at the New York headquarters. Perhaps your letter will help to bring the Opera into your home.

TELEPHONE GIRLS' WORK IN FRANCE.

It is difficult for us to realize the scope of the work that has been done and is still being accomplished by the telephone operators in France. To serve the needs of an army of two million men, and to connect that army up with the French by telephone was a matter that required no small amount of organization and planning on the part of the Signal Corps, says the *Telephone Review*. The distribution of the girls in the Signal Corps service asked for careful study and met with unqualified success.

Learn Public Speaking

10 LESSONS FREE

Write — quick — for particulars of this extraordinary offer; an opportunity you will never forget if you take advantage of it. Ten lessons in effective public speaking absolutely FREE to those who act promptly, to introduce our course in localities where it is not already known.

We teach you by mail to become a powerful and convincing speaker—to influence and dominate the decisions of one man or an audience of a thousand. We have trained hundreds and helped them to increase their earnings and their popularity. Learn, in your spare time at home, how to overcome "stage-fright" and conquer fear of others; how to enlarge your vocabulary; how to develop self-confidence and the qualities of leadership; how to RULE others by the power of your speech alone; now to train your memory. Our

WHAT THE COURSE TEACHES YOU.

How to talk before your club or lodge;
How to address board meetings;
How to propose and respond to toasts;
How to make a political speech;
How to tell entertaining stories;
How to make after-dinner speeches;
How to converse interestingly;
How to write better letters;
How to sell more goods;
How to train your memory;
How to enlarge your vocabulary;
How to develop self-confidence;
How to acquire a winning personality;
How to strengthen your will power and ambition;
How to become a clear, accurate thinker;
How to develop your power of concentration;
How to be the master of any situation.

New Easy Method

perfected and taught only by Prof. R. E. Pattison Kline, former Dean of the Public Speaking Department of the Columbia College of Expression, can be learned in 15 minutes a day. Prof. Kline is one of the foremost authorities in the country on public speaking and mental development. Do not let this chance escape you.

Learn Telegraphy-Wireless

Right In Your Own Home, in your spare time

Remarkable opportunities are offered experienced wireless operators and telegraphers. The demand is greater than the supply—steady positions at increased pay and rapid advancement are assured.

DEPENDABLE KNAPP ELECTRIC SPECIALTIES

Combination Wireless-Telegraphy Outfit

will soon make you an accomplished operator. Teaches Light and Sound Signals, both Radio and Morse. Outfit consists of exceptionally fine Telegraph Key, Buzzer, 3 Binding Posts, Lamp, Lamp Socket and Control Switch —all mounted on a highly finished base. Two outfits can be operated at considerable distance apart for sending and receiving practice.

$3.00

This Same Outfit Without Lamp **$2.50**

Order to-day. Or your dealer can secure it for you. Descriptive circular and catalog of celebrated Knapp Motors and Electrical Specialties from 10c up mailed free on request.

Knapp Electric & Novelty Co.
523 West 51st Street New York City

KNAPP LEADER
Radiates real power-plant efficiency. Two Speeds and Reverse.
Price, Complete, $3.50

1/4 H.P., 110 volts, A.C. 60 cycle, single phase, 1750 R.P.M.

MOTORS

We have 1000 NEW WASHING MACHINE MOTORS. These are of standard manufacture and carry the regular factory guarantee. Shipped in original boxes. Complete as cut.

Bought from Bankruptcy Stock

Suitable for operating Coffee Grinders, Cream Seperators, Bottle Washers, Air Compressors Small Lathes, Etc.

YOU HAVE A BEAUTIFUL FACE

BUT YOUR NOSE?

BEFORE

AFTER

IN THIS DAY AND AGE attention to your appearance is an absolute necessity if you expect to make the most out of life. Not only should you wish to appear as attractive as possible, for your own self-satisfaction, which is alone well worth your efforts, but you will find the world in general judging you greatly, if not wholly, by your "looks," therefore it pays to "look your best" at all times.

Permit no one to see you looking otherwise; it will injure your welfare! Upon the impression you constantly make rests the failure or success of your life. Which is to be your ultimate destiny? My new *Nose-Shaper*, "TRADOS" (Model 24) corrects now ill-shaped noses without operation, quickly, safely and permanently. Is pleasant and does not interfere with one's daily occupation, being worn at night.

Write today for free booklet, which tells you how to correct ill-shaped noses without cost if not satisfactory

M. TRILETY, Face Specialist **1162 Ackerman Bldg., Binghamton, N. Y.**

TYPEWRITER SENSATION

PROMPT SHIPMENT.

$4.00 per month buys a beautifully reconstructed, latest model visible typewriter, with back spacer, decimal tabulator, two-color ribbon, etc. Every late style feature and modern operating device. Sent on approval. Catalogue and special prices free.

Harry A. Smith, 738, 218 N. Wells St., Chicago, Ill.

HOW AIRPLANES FIND THEMSELVES BY RADIO.

(*Continued from page* 871)

"The use of directional effects of loops or coils for receiving radio signals has resulted in the development of a radio compass for airplanes which gives positive information to the aërial navigator and enables him either to locate his position by triangulation with respect to two beacon land stations or to fly at any given angle with respect to a certain beacon station.

"The apparatus consists of two principal parts—the antenna coils and the tuning and amplifying apparatus. The antenna coils are mounted in the fuselage of the Handley Page airplane, with suitable means for rotating in azimuth. The amplifier is extremely sensitive, consisting of a detector and six-stage amplifier. A novel feature of the amplifier is the use of iron-core transformers for frequencies of 100,000 cycles.

"The direction of the beacon land radio station is determined by maximum strength of signals, in a highly ingenious manner developed originally by the British. The precision of the directional effect is remarkable. In fact, the radio direction finder may well be called a radio eye."

EXPERIMENTAL PHYSICS.

(*Continued from page* 867)

to send and take messages in spite of the enemy's interference by sending out impulses of similar wave length and other distributing influences. The problem of using a non-inflammable gas for inflating balloons and dirigibles has been solved under the direction of a Physicist and a Chemist, both "fool professors".

The submarine has probably attracted as much of the attention of the scientific men as all other war inventions combined, both as to its detection and its destruction. The detection of the submarine is a definite physical problem, and it is estimated that about one-fourth of the Physicists of the Allies have devoted a considerable portion of their time to solve this problem alone. The problem had been attacked from three standpoints, light, sound, magnetism and electricity, three branches which almost comprise the entire subject of Physics. The destruction of submarines has been successfully accomplished by the use of the depth bomb.

In long range artillery work, temperature, moisture, and wind are to be carefully determined; this is done by physical apparatus. Wind direction and barometric pressure information is essential in a gas attack. This information is furnished by physical apparatus. Anti-aircraft gunnery is largely indebted to physical research and calculations for its effectiveness. The speed of the airplane must be ascertained, its direction of motion, its height above the ground, the speed of the attacking shell, and its path.

The airplane camera would be almost useless were it not for our knowledge of the branch of Physics known as *spectroscopy*. Pictures can be taken which the eye cannot see because of fog, cloud, haze or distance. By the use of the proper filters, the enemies guns camouflaged so as to be indiscernible to the eye are photographed and their positions located. The sound method of locating guns is very important. Three sounds are heard from a shell sent by the enemy. First we hear the hissing noise of the shell whizzing thru the air. Shortly afterward the boom of the gun is heard. (Since sound travels at about 1,100 feet per second and the shell's speed is greater than that). Finally we hear the sound of the exploding shell. If the time when the first of these three sounds is heard is recorded at several observing stations, from the speed of sound, and the difference in time recorded at these stations, the position of the

www.americanradiohistory.com

gun firing the shell can be calculated in a few minutes.

The Bureau of Standards, at Washington, a great national Physics institution, has certainly done its share in the war. Vacuum tubes were studied in detail, from the standpoints of sending, receiving, and amplifying wireless messages, and many important improvements were evolved. High frequency oscillographic equipment was developed. The characteristics of airplane bombs were studied, resulting in new methods of computing trajectories. New types of machine gun sights were invented. Instruments for recording the speed, altitude, direction, etc., of the airplane were perfected. Special ignition apparatus for the Liberty engine was invented. A carbureter was developed which gives a correct mixture by the simple motion of a single throttle whether the airplane is on the ground or up 3,000 feet. A fabric 25 per cent. lighter but stronger than linen, extra light but strong alloys, and non-corrosive alloys were invented. These are among the best of its accomplishments which have been made known.

Now that the war is over we shall daily hear of new, marvelous and quite astounding inventions, that have been evolved and perfected. The "fool professor" has now come before the public eye and is regarded with just and long deserved admiration and respect by it. Some, like Professor Millikan, have had exciting military times, such as quieting a "buck private" under the influence of liquor, being fed delightful sandwiches by fair white hands of Red Cross and other workers, etc., while others have suffered an existence under the S. A. T. C., and those more fortunate have spent their time in France near the front; all however have done their share nobly. In closing let us bear in mind that all that has been said of Physics and the Physicist applies equally well to the other sciences and scientists. *(Conclusion)*

EGGS PRODUCED BY ELECTRICITY.

The production of eggs by electricity may seem like an idea evolved in a madhouse, but it has been made a paying proposition at the Montana State College. By electric lighting of poultry pens, Professor W. F. Schoppe, poultryman of the state college, has created a sort of "daylight saving plan" for hens, whereby egg production has been increased more than twofold at a time when eggs were highest in price. In experiments covering the month of November last, Professor Schoppe showed a net gain of 28 cents per hen in value of eggs produced in ten lighted pens.

The experiment was tried on two pens of Leghorn hens, 160 in each pen. One pen was lighted with four 60-watt lamps, the other was left unlighted. The lights were turned on in one pen at 6 a. m. and switched off at 8.30 p. m. From the time the lights went on until they were dimmed at night, the hens in the lighted pen scratched away with all the energy of early spring or summer, showing a greater interest in the business of egg producing than ever.

The 160 hens in the unlighted pen produced during the month 443 eggs. The same number of hens in the lighted pen produced 1,306 eggs, a gain of 72 dozen. Hens in the lighted pen consumed little more food than their less active neighbors. The net gain was 28 cents per hen in egg production for the "electric" hens.

"I cannot say yet," said Professor Schoppe, "what effect this forced production will have on the hatching quality of eggs and upon the vitality of hirds, as those are problems that will require further investigation."

(See our May, 1918 issue for full details of the automatic electric lighting in hen-houses.—EDITOR.)

A TIMELY REINFORCEMENT.
A Copper Plated Stomach.

(Continued from page 877)

thanks to mother and the salt fish—*and* the cat.

You have to begin by discarding the whole idea of sheet copper. It would be all right, and any plumber could make up a good tummy in half a day—even including going back to the shop for his tools—but for the fitting of it, or inserting, or whatever you'd call it. That's a sticker; it's what's kept the invention back all these years.

But why not plate the copper on from the inside? Sure! There it was, right off the bat!

Fig. 1 shows the invention—patents pending—all worked out—perfectly simple. You procure an atomizer, A, and attach to it a long fine rubber tube, B. This tube is surrounded by a spiral wire, C, and both are covered by high-tension insulation, K.

At the further end, both the tube and the spiral wire are connected with the perforated metallic hollow sphere, E. The atomizer-bottle, F, is filled with a solution of sulfate of copper, and the spiral wire is connected with one pole of the spark-coil secondary, H. Around the patient's waist is then buckled the belt I, containing a strip of wire netting J, connected with the other pole of the spark-coil.

All being ready, the patient "swallows" the perforated ball, E, with enough of the tube to maintain communication with the outer world. The ball is then resting nice and cozy within the tummy. Mark the patient closely; a really delightful surprise is about to be handed to him? × ! Pressure on the bulb, G, projects a spray of copper sulfate from the perforations of the sphere, E, while at the same time a touch of the key, L, causes a shower of sparks to be thrown from the ball toward the metallic belt without. The sparks pass easily thru the patient's tissues, but not so the sulfate. This is decomposed by the electric current, and metallic copper is *deposited* on the gastric lining, forming a dense and highly polished surface, ready to tackle any food product short of Bangor red-eye and Irish confetti—brick-bats.

Perhaps you wondered why, before the operation, the patient took a few magnesia tablets, together with a peppermint "life-saver". This was to take care of the other product of the reaction, sulfuric acid—otherwise the patient might as well be fed to death as the way he is. The magnesia neutralizes the acid, producing a pleasant effervescence, which, being flavored by the peppermint, becomes the exact equivalent of an ice-cream "sody" fresh from the fountain.

So behold! at the end of the operation, when the patient finishes his cigarette and lets go the nurse's hand, there he is,—equipt with a perfectly-fitting copper stomach, enclosing a temperance-drink as a hint to guide him in the selection of future contents for it—like a new tin bank for little Willie, with a dime in it.

No, no, put aside that medal. Really I—well, if you must, you must. But I refuse to patent the idea in Germany. Absolutely. It's going to be dedicated to the free use of all free and civilized countries. "That's me all over—liberal, Mabel."

Note—The editor tried "Tom's" latest stunt. After he was dismist from the hospital, and was at last equipt with his copper "insides", he felt pretty weak! So he promptly swallowed a few pounds of zinc dust with his next meal. The copper tummy, the gastric juice—(an excellent electrolyte) —plus the zinc dust, makes a really excellent battery. It strengthened and revived the editor at once. It works so well that he has given up all food in preference to zinc dust. A slight change in diet is had with magnesium dust—it tastes better, and gives a much higher voltage. Iron filings were tried, but they made the editor "rusty"!

BOYS

Learn Drafting

Employers everywhere are looking for skilled draftsmen. They are offering good salaries to start with splendid chances for advancement.

Drafting offers exceptional opportunities to a young man because drafting itself not only commands good pay, but it is the first step toward success in Mechanical or Structural Engineering or Architecture. And drafting is just the kind of work a boy likes to do. There is an easy delightful way in which you can learn right at home in spare time. For 27 years the International Correspondence Schools have been giving boys just the training they need for success in Drafting and more than 200 other subjects. Thousands of boys have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon, then mark and mail it. This doesn't obligate you in the least and will bring you information that may start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon now.

TEAR OUT HERE

Let Me train YOU in AVIATION

Capt. G. E. Campbell, formerly Third Ace of the Royal Flying Corps.

My advice to you is to start right now to take my

HOME COURSE IN AVIATION

and prepare to fill one of the big jobs later. Wonderful opportunities. Trained men in big demand. Prepare now for big future. Lessons are easy to understand. Write TODAY for my FREE BOOK, "The Science of Aviation," and I will send it and write you a personal letter that will interest you. Address:

CAPT. GEO. F. CAMPBELL, Chief Instructor, National Aero Institute, 538 S. Dearborn St., Dept. 7444, Chicago

INSYDE TYRES Inner Armor for Auto Tires. Double mileage, prevent blowouts and punctures. Easily applied in any tire. Thousands sold. Details free. Agents wanted. Amer. Accessories Co., Dept. F3, Cincinnati

JOHNSON SMITH & CO.'S Annual Condensed PRICE LIST of FINEST FLOWER, GARDEN & VEGETABLE SEEDS

All prices postpaid to any address in the world.

Calabash or Pipe Gourds

A luxuriant and rapid growing climber; thrives anywhere. Produces the ornamental gourds from which the famous African calabash pipes are made. Grow this interesting vine and dry and prepare your own. Seeds, with instructions, 15c pkt., 3 for 40c.

Japanese Nest Egg Gourd

Very curious. Produces fruit same size & shape and color of nest eggs. Matured fruit does not crack. Will serve for years as a nest egg, stocking darner, or ornamental purposes, etc.

Seeds 15c pkt., 3 pkts. for 40c.

DEVIL'S CLAW

An ornamental plant, bearing beautiful flowers which are succeeded by large seed pods that, when young, are fine for pickling. They are delicious in soups, stews, etc., and make fine pickles. Pkt. 10c, 3 for 25c

Johnson Smith & Co., Chicago

Butterfly's Own Bush

This plant is a veritable refuge or haven for butterflies, and it attracts all the most beautiful types of butterflies to the neighborhood. Bees, too, are very fond of it. It is a pretty plant bearing pretty double flowers, ranging from white to rich crimson, deep red and pink, lilac and other delicate shades.

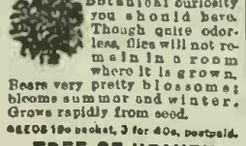
10 cents, 3 for 25 cents postpaid.

Shoo Fly Plant

A very remarkable Botanical curiosity you should have. Though quite odorless, flies will not remain in a room where it is grown.

Bears very pretty blossoms; blooms summer and winter. Grows rapidly from seed.

SEEDS 15c packet, 3 for 40c, postpaid.



CROWN OF THORNS

A very curious and remarkable window plant, can be trained over any desired form. Bright scarlet flowers. An object of rare and striking beauty, easily grown. It grows wild in Judea, and it is said that it was from this plant that the crown of thorns was made which was worn by our Saviour.

Packet 10 cents, 3 packets for 25 cents

TREE OF HEAVEN

This splendid ornamental tree is a native of China, and is called the Tree of Heaven, on account of its great beauty. Very hardy, thrives in any soil, no matter how poor and grows from 6 to 10 feet high from seed the first summer. The leaves are from 8 to 5 feet in any length, giving it a grand appearance. Nothing outside the tropics will fit for lawn decoration. Large panicles of bloom, followed in season by great clusters of colored seed pods, make the tree a continual thing of beauty. Packet, 15c, 3 packets for 40c, postpaid. Johnson, Smith & Co.

The Trembling Vine

A beautiful annual climber with lovely feathery foliage, that trembles in the breeze, showing masses of tubular flowers of scarlet, pink and white. The effect in most charming, the tubular flowers contrasting effectively against the bright, delicate, fern-like leaves. For training upon a light trellis the Trembling Vine cannot be excelled. For window decoration, or ornamental work of every description it is very pretty indeed.

Packet, 15c, 3 pkts for 40c, postpaid.

PORTULACA

Very popular for edgings, rock work, &c. Flowers are large and double, colors very brilliant red, orange, white, maroon, yellow, and various other shades. A bed of Portulacas makes a truly magnificent sight. Blooms very profusely.

Packet 10 cents, 3 for 25 cents

The Fountain Plant (Amaranthus Salicifolius)

Finest of all Decorative Plants. It is quite a curiosity either for lawn or home decoration on account of its rapid and very vigorous growth. Bears long wavy racemes of curious drooping branches, tipped with orange, bronze and crimson. Grows very readily, succeeds anywhere. Greatly admired for table or window decoration. 15 cents per package.

CATCHFLY PLANT

An Effective and Efficient Substitute for Fly Paper

A great curiosity. Flowers are a beautiful white, red or pink that makes them very desirable as house plants, or may be cultivated in open garden. The surface of the bladder underneath the flower is covered with a sticky material. This is where it gets its name. Catchfly, and small insects and ants that climb up become entangled and lose their lives in the fruitless effort to get at the sweets. By picking the flowers, that bloom very profusely, and placing them in a vase in a room, you have a fly catcher that is more effective and pleasanter than fly paper. The flies are attracted to the plant, and thus it is a simple matter, by having flowers in each room, to keep the house rid of the pests. The plant seems to be endowed with remarkable intelligence, for it does not harm winged insects such as butterflies, because it is necessary to have the pollen of the flower carried from one flower to another, in order to cross-fertilize, as this cross-fertilization is what makes the flower "set its seed." SEEDS, 15c packet, 3 pkts for 40c, postpaid.

GROUND ALMONDS

Amazingly Prolific—Easily Grown From Seed

The Ground Almond has a flavor that is MOST EXCELLENT, resembling the cocoanut. The meat is snow white, covered with a dull ar skin of brown color. It grows close to the surface and anything from 200 to 300 Almonds may be expected from a single nut. There is no trouble whatever in growing anywhere and in any kind of soil. May be planted any time, and in eight or ten weeks after time of planting you will have an ENORMOUS CROP of the MOST DELICIOUS ALMONDS YOU EVER TASTED. Seeds 15c Pkt.

Perfume Plant

Blooms only at night, giving forth the most delightful scented fragrance for quite a distance. Causes much comment. For house or garden. Also valuable for use of perfume made from it. SEEDS, 10c pkt., 3 for 25c.

SENSITIVE PLANT

Marvel of the Philippines. Leaves curl, fronds droop when touched. Apparently resents interference.

A handsome shrub for house or garden; very curious and interesting. Seeds, 15c a pkt., 3 for 40c.

Chinese Fragrant Tree Fern

Just introduced. Noted for its rapid growth. An exceptionally pretty ornamental plant. Foliage is rich dark green. Forms grand pyramidal bushes about 6 feet high. Handsome; very desirable for decorative purposes, wreaths, etc. Seeds 15c pkt., 3 for 40c.

Weather Plant

NATURE'S WEATHER PROPHET

By mysterious changes that take place, this remarkable plant accurately forecasts the weather many hours in advance. Will grow anywhere all the year around. An interesting house plant. Bears large, fragrant, pink, butterfly shape flowers.

Seeds, 15c packet, 3 for 40c, postpaid

Tom Thumb Calliopsis

Very showy, low-growing, compact bush, covered with golden yellow flowers with deep crimson centers growing to a height of six inches. Seeds, 10 cents pkt, 3 pkts for 25 cents, postpaid.

FOXGLOVE

Produces long spikes of richly colored flowers, excellent for cutting. Particularly showy and desirable for use among shrubbery and in partly shaded spots. However, it will grow just as well in the open. Easy to cultivate, requires little attention, produces mass of flowers throughout the season. 10c pkt.

Early Blooming Mammoth Carnations

A wonderful strain, producing flowers two weeks from seed, at least 80 per cent of the flowers being double. All of the beautiful shades of carnations will be found in this assortment. 10c pkt, 3 pkts for 25c, postpaid.

Electric Light Plant

Remarkable curiosity, grows to the height of four feet, covered with large spikes of flowers six to eight inches long, in lovely shades, pure white at base and rose to bright red at top of flower. 10c pkt.

BRUSSELS SPROUTS

Miniature cabbages formed on the stalk of the plant. Delicious eating when cooked. Boiled like cabbage or cooked in cream same as cauliflower. The plants are grown in rows two feet apart and the sprouts in the row. Packet, 10 cents, three packets for 25 cts, postpaid.

CANARY BIRD VINE

Highly ornamental creeper with beautiful cut leaves and pretty, delicate flowers of a canary yellow, bearing a striking resemblance to a canary bird with wings half expanded. Makes a desirable window decoration. Grows up to twenty feet high.

Packet, 10 cents, three for 25 cents.

BALLOON VINE

"Love in a Puff." Ornamental, rapid growing, climbing vine, producing pretty white flowers, followed by remarkable seed vessels or inflated membranous capsules that look like small balloons. Packet, 10 cents, three for 25 cts.

BRILLIANT POPPY MIXTURE

Collection is made up of all varieties that will give a constant bloom from early until late in the season.

One of the easiest flowers to grow, and for a variety of colors nothing can compare with the delicate form and color of these blooms. Packet, 10 cts, three packets for 25 cents, postpaid.

Giant Climbing Nasturtiums

For covering trellises, fences, arbors, &c., and other places to be hidden. Very strong and vigorous, with large, dark green foliage, producing great quantities of giant flowers of all colors. Packet, 10 cents, three packets for 25 cents, postpaid.

ORANGE KING MARIGOLD

Fine type of Marigold, bearing dense double flowers of a rich, deep golden-orange color. Very desirable for cut flowers. Grow anywhere, blooming profusely and continuously.

Pkt, 10c, three pkts for 25c, postpaid.

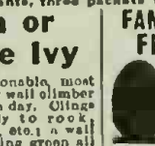
The Great Japanese Umbrella Palm

A Graceful House or Conservatory Plant

Easily Grown From Seed Winter or Summer

The Japanese Umbrella Palm is a semi-aquatic plant. It is easily grown from seed either in a bowl of water or in very damp soil. Probably the most usual, as well as the most interesting method, is to cultivate the plant in a bowl or jardiniere filled with water, with two or three inches of good garden soil at the bottom. The seeds soon commence to germinate, and the plant shoots up stems two to three feet high and rapidly assumes a most pretty palm-like appearance, as shown in the engraving. The tops of the stems are surmounted by a whorl of umbrella-shaped leaves, of a waxy appearance. We will send a package of this seed, with full instructions for culture, for only 15c or three packets for 40c postpaid.

VINE PEACH VEGETABLE ORANGE OR MANOO MELON



One of the best of all vegetables. Resembles oranges in color, shape and size; grows on vines. Presents a most tempting appearance when canned; makes delicious preserves and sweet pickles, and fine for pies. Nothing like them; grows from seed in 80 days; enormously productive; can be used in every way as the peach, but not quite as sweet and not used raw. Packet, 10 cents, three packets for 25 cents, postpaid.

Boston or Japanese Ivy

Fashionable, most hardy wall climber of the day. Clings tightly to rock, brick, etc., a wall of living green all summer, turning in autumn, to a flaming, gorgeous crimson. SEEDS, 10 cents packet, three packets for 25 cents, postpaid. J. S. & Co.

FAMOUS MEXICAN FIREFLY PLANT

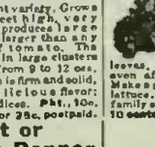
Beautiful hedge plant, grows 8 to 10 feet high and resembles a closely clipped ornamental evergreen. The globe-shaped or pyramidal bushes are close and compact, and of a pleasing light green color. May be grown singly or in the form of a hedge or background. In early autumn the whole bush becomes carmine or blood red, hence its name of Mexican Fire Plant, or "Burning Bush," as it is sometimes called. Selected seeds, 10c packet, three packets for 25 cents.

The Matchless Dwarf Giant Tomato

A magnificent variety. Grows about two feet high, very strong and produces large sized fruit; larger than any other dwarf tomato. The fruits grow in large clusters and weigh from 9 to 12 ozs. each. Flesh is firm and solid, no core, delicious flavor; almost seedless. Pkt., 10c, 3 packets for 25c, postpaid.

Grand Rapids Lettuce

Easiest variety of all to grow the finest flavored on the market. Produces an abundant crop of green leaves, which retain their sweet flavor even after it has become quite old. Makes a practical substitute for lettuce. A single packet will keep your family supplied the whole season.

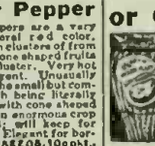


10 cents packet, 3 packets for 25 cents

Bouquet or Red Cluster Pepper

The Peppers are a very pretty coral red color, formed in clusters of from 12 to 30 on the upright fruits to each cluster. Very hot and pungent. Unusually prolific, the small but compact bush being literally covered with cone shaped fruit. An enormous crop produced; still keep for use all through winter. Elegant for borders or with pot herbs. SEEDS, 10c pkt., three packets for 25 cents, postpaid.

Salsify or Oyster Plant



One of the most delicious vegetables; gets its name from the similarity of its flavor to oysters, frequently hard to tell the difference. Exceptionally wholesome, nutritious, satisfying. A very hardy plant that can be left in ground all winter and dug as needed when ground thaws. 10 cents packet, three packets for 25 cents, postpaid.

The Giant Spider Plant

A very remarkable and curious plant. Derives name from peculiar shape, the long, curving stamens suggesting spiders. Flowers are a deep, purplish pink when they first open, but fade to light pink. Seeds, 10c packet, 3 pkts. for 25c.

Mixed Squash Seeds

You will get all the different shapes, freaks, colors and sizes imaginable. A dozen different varieties included, early and late; you will derive much pleasure from their cultivation.

Mixed Seed, 10c, 3 packets for 25c.

Giant Crookneck Summer Squash

Selected strain of this delicious vegetable. Produces fruit nearly double the size of the old standard "Crookneck." Plants are bushy and compact. Fresh, rich, golden yellow; quality and flavor is unsurpassed. Grow readily in almost any soil.

Packet, 10c, 3 packets for 25c, postpd.

White Velvet Okra

Most delicious vegetable that is very fashionable and popular. Is easily grown. The pods are used for soups and stews. Noted for its fine flavor and tenderness.

Pkt., 10c, 3 for 25c, postpd.

New Japanese Giant Radish

The great Sakurajime Radish from Japan. The largest radish grown, often attaining the enormous weight of 15 pounds, and sometimes 20 or 30 pounds. Not merely a curiosity, but a radish of extraordinary quality. The flesh is solid, firm and brittle, and of most excellent flavor. Will grow or thrive in any soil or climate.

Packet, 10c, 3 pkts. for 25c, postpaid.

New Garden Huckleberry

Grows from seed first year. A new fruit that can not be excelled for Pies. Very prolific, yielding an immense crop of fruit. Grows and thrives in all climates and on all kinds of soil. The fruits grow larger than the common Huckleberry or Blueberry. If cooked with apples, lemon or anything sour, they make the very finest jelly.

Pkt. 10c, 3 for 25c. p.pd.

APPLE PIE MELON

A wonderful novelty that you will find a delight in cultivating. Vine and fruit are similar to a watermelon. Has a most delicious flavor, resembling the flavor of apples. Each vine produces 6 to 18 bushels of melons, producing on an average about 900 pounds of fruit. One melon will make as many pies as a half bushel of apples. Flesh is white and solid and of excellent quality for making pies, sauces, preserves, etc. They keep fresh and solid all winter, so can be used when wanted, and, owing to their value as stock food, any surplus not used for home cooking can be fed all winter to stock; in fact, it will pay to raise them for this purpose alone. Packet, 10 cents, three packets for 25 cents, postpaid.

Japanese Pop Corn

Nothing delights the children more. When well popped it becomes nearly twenty times its natural size. In the long winter evenings it keeps the children amused for hours watching the kernels burst into white balls, that are as light as a feather. Every family will enjoy planting it and caring for it and watching it grow.

Packet, 10c, 3 packets for 25c.

Banana Musk Melon

Quite a curiosity. Looks and smells like a banana. Peculiar shape and its delicious flavor make it well worth your while cultivating. Flesh is deep and of exquisite flavor. Very high prices are obtained in choice city markets, as high as a dollar sometimes being demanded for one single specimen.

Packet, 10c, 3 pkts. for 25c.

LUCCULAS SUMMER SPINACH

Two distinct vegetables from the same plant at the same time. The leaf portion of the foliage is cooked and served in the same manner as spinach; the stalks are delicious when cooked and should be served in the same manner as asparagus.

Packet, 10c, 3 packets for 25c.

Giant Asparagus

A few stalks of this rich and delightful vegetable on toast, or served with drawn butter, will make the greatest epicure punctuate each bite with a smack of satisfaction. One of the grandest table luxuries that you can buy. Has delicately tender stalks with exquisitely delicious flavor.

Packet, 10c, 3 pkts. for 25c.

Early Chantenay Carrots

Very tender and delicious, one of the best early Carrots in existence. Grow about 6 in. long, are stump-rooted, very smooth, deep red fine grained sweet and sugary and not apt to crack open while growing. Unsurpassed for table use.

Packet 10c, 3 pkts. for 25c, postpd.

Chicago Pickling Cucumber

Undoubtedly the best cucumber for pickles. It meets the most exacting requirements of the most critical pickle makers, who supply fancy and highest priced goods to the market. The vines set fruit when young and continue bearing longer than other varieties.

Packet 10c, 3 pkts. for 25c postpaid.

Giant Pascal Celery

Stalks are very large and solid, crisp and of rich, nutty flavor. Blanches easily and quickly. The heart is golden yellow and has a very attractive appearance.

Packet, 10c, 3 packets for 25c.

Chinese Giant Pepper

Very prolific for so large a pepper. Flesh is unusually thick, mild flavor and makes a very fine salad, sliced and served like tomatoes. Glossy scarlet.

Packet, 10c, 3 pkts. for 25c.

Jerusalem Cherry

A miniature tree that bears red and green berries continually in winter and summer. Foliage is always green. The fruit, however, is not edible. Especially fine for ornamental purposes.

Packet, 10c, 3 for 25c postpaid

Garden Lemon

An enormous yielder, cultivated much the same as Musk Melon. Has a most desirable acid flavor, thus dispensing with sliced lemon. Unexcelled for general canning purposes.

Packet, 10c, 3 packets, 25c.

Snake Cucumber

Curious as well as useful. Elegant for slicing when quite young. Coils like a serpent up to 7 feet in length. A novelty well worth cultivating.

Packet, 10c, 3 packets for 25c.

Dusty Miller

One of the prettiest of ornamental leaved plants. The leaves are white and are beautiful for vases, edgings, ribbons, or mixed with cut flowers.

Packet, 10c, 3 pkts. for 25c.

A few other reliable seed novelties you should cultivate. *All 10c per packet, p.pd.*

JAPANESE ROSE BUSHES

The Wonder of the World

Japanese Rose Bushes **bloom all the year round.** Just think of it. Six weeks after planting the seed, the plants will be in **full bloom.** It may not seem possible, but we positively **guarantee it to be so.** They will **bloom every ten weeks,** Summer or Winter, and when three years old the bush will be a **mass of roses,** bearing from 5ve hundred to a thousand roses on each bush. The flowers are in three shades — white pink, and crimson. The plants will do well both in and out doors We guarantee at least three bushes to grow from each packet of seed. **Price, 10c** packet, 3 pkts. for **25c** postpaid.

10 Cts.

SCARLET FLAX

Showy annual for flower beds and masses, brilliant crimson scarlet flowers, great profusion. Blooms very quickly.

Packet, 10 cents, 3 packets for 25c p.pd. Johnson Smith & Co.

PYRENTHRUM

Large, very bright and showy, very much like daisies and asters. Colors range from white, light pink, to deep red, with bright yellow centers. Flowers are 3 or 4 inches across. One of the best plants for edgings, or for cut flowers, on account of its beautiful yellow foliage. **Packet, 10c, 3 for 25c. Johnson Smith & Co.**

GIANT ZINNIA

A very showy annual. Flowers retain their beauty for weeks, and a profusion will be produced until frost. As double and as brilliant as Dahlias.

Packet, 10c, 3 pkts. for 25c, postpaid.

ICE PLANT

Very fine, effective basket plant. Foliage is very ornamental, being covered with ice-like globulies, prized for garnishing. Valuable plant for dry, sunny situations on banks, rockwork, old walls and ruins, etc., also for sunny borders. Peculiarly brilliant in sunshine.

Packet, 10c, 3 pkts. for 25c, postpaid.

CIGAR PLANT

A very fine genus of plants, remarkable for their beauty, freely blossoming ornamental appearance. bears large numbers of tube-shaped flowers of a bright scarlet color with white and purple ends. Always in bloom, cultivated indoors or outdoors. Good for bedding and hanging baskets; very desirable pot plants. **Packet, 10 cents 3 pkts. for 25c p.pd. Johnson Smith & Co.**

Torch Lily or Flame Flower

Has quite a variety of names, the most common of them being "Torch Lily," "Red Hot Poker," "Flame Flower," etc. Flowers are borne in compact form on stout 3 and 4 foot stems, having the appearance at a distance of orange and scarlet tinted cacti.

Pkt. 10c, 3 pkts. for 25c, p.pd.

NICOTIANA

Beautiful annual with sweet scented, large, star-shaped flowers. Blooms very profusely throughout the summer, affording a continuous display of brilliant flowers, flowers are nearly as large as a Petunia, and many are delightfully scented

Packet, 10c, 3 packets for 25c, postpaid

MIXED GERANIUMS

Have no rivals; when a show of colors is desired none can surpass them. Grow readily from seed and their foliage makes them the most desirable plants for house or pleasure ground. Nothing better for baskets, bouquets, vases, etc. Colors include various shades of crimson, scarlet, pink, rose, salmon, blush, white, etc. **Pkt., 10c, 3 pkts. for 25c, p.pd.**

Giant Empress Cockscomb

Very handsome either for pot plants or specimens in beds, where they excite the curiosity of visitors more than almost any plant that can be grown. Very desirable for growing indoors; grow in pots practically all winter Colors, brilliant scarlet, crimson, rose, orange, bright yellow and lemon. **Packets, 10 cents, three packets for 25 cents, postpaid.**

RAINBOW CORN

A charming grass that forms an object of great beauty in mixed beds and borders or planted in groups on lawns. Leaves are striped yellow, green, pink and rose. Not unlike maize or corn in growth. **Packet, 10c, three for 25c.**

PAMPAS GRASS

Comes from South America; very pretty ornamental grass, producing the most beautiful silvery plumes. Very tall and stately, and can be cultivated in this country; a very pretty table decoration, and can be cultivated in pots. **Packet 10c, three packets for 25 cents, postpaid.**

Celosia Spicata

Very pretty and unique variety of Cockscomb family. Introduced from India; bears countless blooms of silver white, with rich carmine tip. Easily cultivated; grown in or outdoors. Blooms practically the antire year if properly cared for **Packet, 10 cents, three packets for 25 cts. postpaid. J.S. & Co.**

THE REMARKABLE FIREFLY PLANT Blooms at Night

Fills the Atmosphere with Fragrant Aroma

One of the most rapid growing vines known. Under favorable conditions this vine has been known to grow OVER 26 FEET IN A SINGLE WEEK. In a very short space of time indeed the Vine has climbed to a great height, and is covered with IMMENSE FLOWERS, from 6 to 7 inches in diameter It is, indeed, a great novelty, for, unlike other plants, the flowers OPEN IN THE EVENING, and remain open until about noon the following day. In dull weather they will remain open all day. It is a most INTERESTING SIGHT to watch the opening and closing of the flowers as the clouds appear and disperse. As the flowers open they give forth the most DELIGHTFUL AROMA and the whole atmosphere around is full of scented fragrance. It is always the object of favorable comment, and much curiosity is aroused by people passing at night time as to the cause of the charming aroma, frequently stopping in an endeavor to satisfy their curiosity **PRICE, 10 CENTS packet, two packets for 25 CENTS, POSTPAID.**

Mammoth Peanuts

Peanuts can be easily cultivated. Their culture is very simple and exceedingly interesting. Mammoth Peanuts grow to an astonishing size. It is a good producer, very prolific, and the giant nuts have a thick, heavily ribbed protecting shell. The plant is very attractive, the leaves being of odd shape and a handsome green shade, tinted through the center with white. You will derive much pleasure cultivating this interesting species. **Seeds 10c skt., 3 pkts. for 25c**

Monster Mixed Petunias

No flower garden is complete without a bed of Petunias. Few plants can compare with them for beauty. Bright yellow centers, Flowers are 5 or 6 inches across. One of the best plants for edgings, or for cut flowers, on account of its beautiful yellow foliage. **Packet, 10c, 3 for 25c. Johnson Smith & Co.**

DAHLIA

One of the most beautiful of all flowers. If seeds sown early in the spring will bloom the first year. Our seed is of the finest strain, and produces large flowers of the richest shades. **Packet, 10c, 3 packets for 25c, postpaid.**

Johnson Smith & Co., Chicago

LARKSPUR

Remarkable for beauty, diversity of shades and decorative qualities. Blossoms are of immense size, single, double and semi-double. The colors range from white and lavender through every shade of blue, some having several shades on stem. Very effective in borders and planted among shrubs. The graceful spikes of bloom are much valued for vases. **Packet, 10c, 3 pkts. for 25c p.pd.**

SNAP DRAGON

Charming old fashioned flower. They have dark and glossy leaves and curiously shaped flowers, with finely marked throats. Bloom the first season. Splendid for borders, bedding, pot culture for house decoration, and are largely forced during the winter for cut flowers. Their delicious fragrance renders them extremely well adapted for cut flowers. **Packet, 10c, 3 pkts. for 25c, postpaid**

California Poppy

The state flower of California. A very attractive annual for beds, edgings or masses. Flowers profusely, foliage fine cut and of bluish color. The flowers are very large, measuring about three inches across, of a canary yellow color with a blotch of golden orange at the base of each petal. Valuable for bedding; from seeds sown in the spring they flower profusely until late in the autumn. **10 cents packet, 3 pkts. for 25c, postpaid. Johnson Smith & Co.**

Periwinkle or Old Maid Flower

Does well in bright sunshine; the drier and hotter the summer is the more the plants flower. A handsome bushy plant with glossy foliage. Blooms the first season. As bedding plants for the garden they rival the Geranium. They make very attractive pot plants. White, pink and mixed.

Packet, 10c, 3 pkts. for 25c postpaid.

COLEUS

For indoor decoration, for the adornment of the greenhouse or sitting-room, the Coleus plants are in the greatest demand. Will grow indoors all through the winter. You can grow them outside, and by taking a few slips, you can start them in pots and they will grow without the slightest trouble. Some of the combinations are very gorgeous. **Pkt., 10 cts, three pkts. for 40 cts, postpaid.**

STOKESIA, or CORNFLOWER

Very handsome, resembling Asters in appearance. Flowers are rich blue, like a giant cornflower, while others include charming shades of lavender, violet, white, and a new pink variety. **Packet, 10 cents, three packets for 25 cents, postpaid.**

Angel's Trumpet

Lovely garden plant, bearing enormous lily-like blossoms on five seven in. across and a foot in length, like a tremendous trumpet, some white as snow, others purple, some golden, others white bordered with lilac. Exceptionally fragrant; a single plant in bloom will scent up a whole lawn or garden. **Packet, 10c, three packets for 25c, postpaid.**

African Daisy

Remarkably handsome annual; forms bushes two feet high Foliage is of a soft downy, of whitish color; flowers, borne on long stems, rising well above foliage, large and showy. Flowers last for over a week when cut. **Packet, 10 cents, three packets for 25 cents, postpaid.**

"Tiger" Flower

Handsome and showy plant, easily cultivated; flowers are large, reddish brown, with golden yellow tiger-like markings, hence its name. Produces an abundance of bloom, in fact the plant is never out of bloom.

Packet, 10c, 3 packets for 25c.

Moss Verbena

Spreads over the ground, forming a carpet of lovely moss green, above which the delicate clusters of purple-blue or pure white blossoms are borne in great profusion. Delicate fragrance when cut.

Packet, 10c, 3 pkts. for 25c.

SURPRISE FLOWER GARDEN Over Hundred Varieties of Mixed Flower Seeds

MANY RARE AND CURIOUS NOVELTIES

An Abundance of Flowers Assured Throughout the Season

A mixture of easily grown annuals that bloom very soon after sowing the seed; others vary in their time of blooming. Those who cannot give the constant care necessary for finely arranged flower beds will be delighted with the Surprise Wild Flower Garden. Will prove a continual surprise and pleasure, as new varieties and the old garden favorites flower successively throughout the season. There are over a hundred varieties of seeds. Many of the plants may be taken inside as house plants and will bloom during the winter. Fine for children, also teachers for school gardens. **Packet, 10 cents, three packets for 40 cents, postpaid. J. S. & CO.**

JOHNSON SMITH & CO., Dept. E5, 3224 N. Halsted St., CHICAGO (OVER)

TEXAN PRIDE PHLOX

Charming, hardy annual. Colors are very rich, bloom of very long duration, rendering them a most desirable acquisition. Very beautiful for bouquets. Colors vary from pure white to deep crimson. Once planted require no further attention for several years. **Packet, 10 cents, three packets for 25 cents, postpaid.**

LOVE IN A MIST

Borrounded with beautiful webbing, feathery foliage. The flowers are very curious looking, having pods in the center. The charming pods in the center. The charming combined effect, no doubt, accounts for name. **Pkt., 10c, 3 pkts. for 25c, postpaid.**

White Gem Feverfew

A fine, old-fashioned bedding or border plant, always in flower. Blooms quickly. Grown outdoors in summer and indoors in winter. A fine pot plant. Grows a foot and a half high. Stems are literally covered with very double, pure, snow-white and golden-yellow flowers. *All the year round* **Packet, 10c, 3 pkts. for 25c, postpaid.**

Chinese Wistaria

For trellis, porches, arbors, trees or buildings, is magnificent when in bloom, bearing long clusters of purple flowers. Luxuriant and rapid growth. Flowers early in long, drooping racemes, resembling a bunch of grapes.

Packet, 10c, 3 pkts. for 25c, postpaid

SCARLET SAGE

A bed or border of Scarlet Sage is always a complete attention. Nothing can equal the gorgeous effect of a bed of Scarlet Sage when in full bloom. The large, flaming masses of scarlet bloom against green surroundings of lovely foliage is matchless. Grown in almost any position; flower on the walk or in borders. Also add to the attractiveness of a shrubbery if planted in clumps in the vacant spaces. The various shades of green and the blending scarlet have a most pleasing effect. Fine pot plants. **Pkt., 10c, 3 pkts. for 25c, p.pd.**

LANTANA

Showy and shrubby bedding and basket plant with Verbena-like flowers in shades of white, red and yellow. Very agreeable aromatic perfume. Rapid-growing, constant-blooming, excellent for growing in pots or for garden decoration. **Packet, 10c, 3 packets for 25c, postpaid.**

Bachelor's Button

Everlasting flower, globe shaped, useful for dried winter bouquets. Retain their color the whole winter. Also good for fresh cut flowers. Endures drought well; succeeds in any soil.

Pkt., 10c, 3 pkts., for 25c pp.d.

Black Eyed Susan

Beautiful trailing plant for hanging baskets, large vases, low fences, verandas, rustic work or green-house decoration. Flowers are orange, white, buff, etc. Height, 6 ft.

Packet 10c, 3 pkts. for 25c, postpaid

Wild Cucumber Vine

Rapid climbing vine reaches height of 30 feet in a season. Clusters of white scented flowers followed by an abundance of ornamental, prickly seed pods that are most interesting to children who like to see them burst. Left on the vine the seeds burst of their own accord and falling to the ground come up the following season. Ideal for trellises or places where a dense shade is desired. **Pkt, 10c, 3 pkts. 25c.**

Jap Virgin's Bower

Most beautiful of all flowering vines. Flowers are white, 5 to 6 inches across, are borne in great wreaths and clusters. The colors are rich royal purple, white or and pearly-white.

Packet, 10c, 3 pkts. for 25c, postpaid

Gorgeous Giant Pansies

These lovely flowers are favorites, not only for their brilliancy and variety, but for the durability of their bloom and the wonderful range of color and marking. A great diversity of all the very best giant and gorgeous varieties. Colors range through all the shades known in Pansies. Wonderful combinations; many of them are rare and new. **Packet, 15c, 3 pkts. 40c, postpaid.**

Asparagus Sprengeri

The best plant for hanging baskets. Masses of lush, gleaming foliage drooping in a very graceful manner. The foliage when cut for decorative purposes will last for weeks in water. The seed pods are very pretty red berries adding to its beauty. **Packet, 10c, 3 pkts. for 25c, postpaid**

Fire on the Mountain

A magnificent plant after the Poinsettia variety. Called "Fire on the Mountain," on account of deep fiery scarlet leaves. The plant presents a darling ray of green and scarlet leaves; effect is very startling. Very showy in the garden, or mixed with cut-flowers for bouquets. **Packet, 10c, 3 pkts. for 25c, postpaid.**

Snow on the Mountain

Beautiful plant for borders or beds. Beautiful leaves, veined and margined with white; pretty white flowers and has appearance of snow from a short distance. **Pkt., 10c, 3 pkts. 25c, postpaid**

Japanese Climbing Cucumber

Unpeelably strong and vigorous growing vine; grows twice the size of ordinary varieties, growing readily on fences, poles, trellises, etc. One hill will keep an entire family supplied all summer.

Seeds 10c, 3 pkts. for 25c.

Ostrich Plume Cockscomb

Unique variety of Cockscomb. Develops great, feathery plumes early in the season; grows like a pyramid, about 2½ ft. high. Can be cultivated in pots. Will bloom practically through the winter.

Packet, 10c, 3 packets for 25c, postpaid.

The Great Wonderberry

A luscious berry that may be grown and ripened from seed in any soil or climate in 3 months. The flavor is fine and unsurpassed for eating raw, cooked, canned or preserved in any form. The fruit is blue-black in color, and tastes like a luscious, rich blueberry. One bush will produce an enormous amount of fruit, yielding great masses of rich fruit all Summer and Fall.

Packet, 10c, 3 pkts. for 25c, postpaid.

Bush Musk Melon

A vineless Musk Melon, grows in bushes, and thus can be cultivated in the smallest garden. The fruit, is of the popular "Jenny Lind" type, but larger, averaging 6 inches in diameter. The flesh is very deep, edible almost to the rind and is colored light green, flushed with salmon toward the center. The quality is superb, luscious, sweet and juicy. Packet of seeds, with full directions for culture, **15 cents, 3 packets for 40 cents, p.pd.**

SUNBEAM GLADIOLUS

Makes a magnificent show in the flower garden or on the lawn. Bears 20 to 60 grand flowers to each stalk. Flowers beautiful beyond description; the colors are gorgeous and markings marvelous. Lend themselves to artistic decoration; from a decorative standpoint are simply exquisite. Bloom early and profusely. **Pkt., 10c, three pkts. for 25 cents, postpaid.**

MIGNONETTE

Mignonette is French for "Little Darling," that typically describes this dainty little flower. Very sweet scented; fragrance makes it indispensable for bouquet and cutting. **Pkt., 10 cts, 3 pkts. for 25 cts, postpaid.**

CACTUS FROM SEED

Very curious, odd looking, strange species of plants; will grow anywhere with little or no care. Flowers are of exquisite beauty and delightfully fragrant. You will be astonished at the odd looks of the Cacti just sprouting. **Packet, 10 cents, three packets for 25 cents, postpaid.**

APPLE BALSAM

Ornamental, quick growing climber, is grown mostly for the effect of the fruit, which is yellow; looks not unlike an apple, hence its name. When ripe stop seeds and shows the seeds and blood-red interior. **Pkt., 10c, three packets for 25 cents, postpaid.**

PANSY-VIOLETS

Produces beautiful Pansy-like blossoms of the most delightful colors, including blue, black, rose, purple, lavender, maroon, all-yellow, gray, crimson, orange, white, lemon, etc., while some are striped, edged and spotted. Many are very fragrant. It is hardier than the pansy and blooms for a longer period. Planted in masses they form perfect mats covered with myriads of flowers.

Packet, 10 cts, 3 for 25 cts. J. S. & CO.

WIND FLOWER

Beautiful Irish Poppy-flowered varieties produce in abundance large single, semi-double and double flowers in an endless variety of colors. Some are mottled, striped, fringed, etc. For cutting they are fine. **Packet, 10 cents, three packets for 25 cents, postpaid.**

Allegheny Vine or Mountain Fringe

Very graceful and hardy climbing vine. Feathery foliage is like the Maidenhair Fern. Bears pretty rose-pink and white tubular-shaped flowers. Nothing better for covering fences, trees, tree stumps, etc.

Pkt., 10c, 3 pkts. for 25c, p.pd.

Japanese Morning Glory

A new mammoth class of noble flowers. Grows 20 ft. by midsummer. Rich, dark green leaves, marbled a silvery white and yellow. Giant size flower, and continues in bloom until destroyed by frosts. The colors are exceptionally rich and flowers as large as teacups.

Pkt., 10c, three packets for 25c, postpaid.

Enormous Prize-Medal Cabbage

Enormous "Prize Medal" Cabbage grows to enormous size and quality any other variety on the market. Grown for us by a specialist in cabbages. Has been known to reach the enormous wt. of 60 to 90 pounds per head, with a diameter equal to that of a bushel basket, while 30 lbs. per head is by no means rare. If you wish to have the finest tasting as well as largest in the whole neighborhood, try a package, and you will not be disappointed.

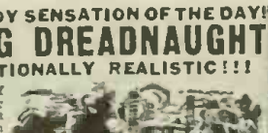
SEEDS, 10c packet, 3 packets for 25c.

"Wong-Bok" Chinese Cabbage

Novelty from China and should be be grown in every garden. Seems to be a cross between Celery and Cos Lettuce. Flavor is more mild than any other cabbage. **Can be served** on the table and eaten raw or cooked like cabbage, spinach or lettuce or made into salad. Grows very rapidly, easy to cultivate. You can create quite a sensation by cultivating this remarkable novelty. Seeds, 15c packet, 3 pkts. for 40c.

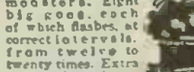
Butterfly Flower

Sometimes called Poor Man's Orchard. Forms compact plants literally covered with countless beautiful orchid-like flowers, all delicately fringed and curiously marked with crimson, lilac, purple and yellow, resembling butterflies in their bewildering range of color. **SEEDS, 10 cents, three packets for 25 cents, postpaid.**



Ever Blooming Hollyhock

Hardy garden flower, blooms from seed the first season; flowers often measure five inches across, with a great variety of beautiful shades and tints. They bear pyramid-shape spikes of large flowers somewhat like rosettes. Continuously covered with large flowers. **10 cents, three packets for 25 cents, postpaid.**



JOHNSON SMITH & CO., Dept. E5, 3224 N. Halsted St., CHICAGO (OVER)

GREATEST TOY SENSATION OF THE DAY!
FIGHTING DREADNAUGHT
SENSATIONALLY REALISTIC!!!

Here is a model of Uncle Sam's fighting monsters. Eight big guns, each of which flashes, at correct intervals, from twelve to twenty times. Extra ammunition always obtainable. Absolutely harmless. TOOTH-ACHE STOP

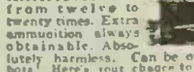
Stops the Pain, Stops the Tooth



Squeeze a little on surface of tooth; the Ache Stops instantly, the pain's hardest. Formula used in septic Filling. Absolutely harmless. Have it ready for the next tooth-ache. 25c per tube, postpaid.

Mysterious Ghost

This is not a pretty object, but there is fun in it for people who like practical jokes. The Ghost will be displayed in a perfectly darkened room, where a ghastly pale bluish radiance, very spooky indeed, will be seen when you show all about it, but a regular starter for those who come upon it unexpectedly. A great joke to play on your mother-in-law. Price only 15 cents each, or three for 40 cents.

"SAFETY 1st" PINS

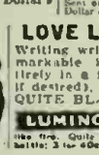
A clever novelty. The National Safety First Movement has made them very popular. Your coat, vest or shoe pop promptly with the movement of the hand for wearing a reminder to strangers and the like. Two sizes, both gold plated and 14k in enamel colors. Be sure, two for 10c postpaid.

INKLESS PENNANT PEN

WRITES with WATER One pen does you die. Makes its own ink. Write fashionable violet color. Better and cheaper than fountain pens. Writes a long letter with one dip in plain water. No trouble—no bother—no mess. A pleasure to use. With Nickel Plated Reservoir Holder 10 CENTS. 3 for 25c

SIMPLEX TYPEWRITER ONLY $2.50

Cheap But Good. So Simple a Child Can Use It. We Guarantee the Writing.



Though an unpretentious little machine, the Simplex is a thoroughly practical Typewriter, in every respect to that of any $100 machine. It does not merely promise at the price, but will positively do more and turn out better work in less time. It is so simple that a child just able to read can write with it. You can learn all there is to know about it in FIVE MINUTES, and an hour's practice will make you an expert operator. Every business man must have a typewriter. It is highly profitable to do so, as it creates a favorable impression that the firm is a commercial and up to date concern. We desire to say that the Practical Typewriter fully deserves its name as it is fit to do the correspondence of any business or professional, and to any part of the world. You should not miss the chance of getting a bargain. The letters of the alphabet, the numerals 1 to 10, and punctuations marks are arranged that the operator must touch the proper key in rotation, one after the other, each time, enabling him to write rapidly. The rollers hold the paper in position while writing and at the end of each line a slight turn of the roller moves the carriage which makes a click and carries the paper forward, giving the proper line spacing so that the lines are all an equal distance from each other, as desirable in letter writing. Each key operates a separate bar, with full printed letters on face of key. Size of machine when closed, 12 inches long, 6 inches wide, 3 inches high. Weight, 4 pounds. Sent by express only. Price $2.50. Johnson Smith & Co., Dept. E 6, 3224 N. Halsted St., Chicago

INVISIBLE INK

The most confidential messages can be written with this ink, for the writing MAKES NO MARK. Cannot be seen unless you know the answer. The ability for many hours. Very necessary to all amateur and private members. Contains enough for many pages. Great fun for playing practical jokes. Only 15c bottle; 3 for 40c postpaid.

LOVE LETTER INK

Writing written with this remarkable ink vanishes entirely in a few weeks (sooner if desired), leaving the paper QUITE BLANK. 15c p. pd.

LUMINOUS INK Writing can be READ like fire. Quite invisible at daytime. Very handy for love letters. Only 15c bottle; 3 for 40c postpaid. ONLY IN A DARK ROOM. writing shines

JOHNSON SMITH & CO.

MULTIPLYING BILLIARD BALLS
The Best Feat of its Kind

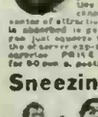
This trick is as startling as it is surprising. The performer hands around the ball for examination, and upon receiving it returned to him he seizes it by the tips of his thumbs and fingers and a second ball mysteriously appears. These are held in full view of the audience by the tips of the fingers of the left hand, and even while being placed in position, another ball mysteriously appears. Finally the magician apparently suffers from some kind of spasm and yet another ball is the result. The feat can then be reversed, the balls disappearing one after another until none remains. The whole interesting trick that is quite easily performed by following the directions that accompany the apparatus. Complete, 25 cents, postpaid. JOHNSON SMITH & CO.

COOD LUCK RING

Occult and Novel Design

A regular $5.00 ring and uncommon find, made of solid nickel silver. Skull and cross-bone design, with two bright black eyes that sparkle out of the eyes. A never failing object of interest. It is said by many to bring Good Luck to the wearer. Hence the name Good Luck Ring, and whilst we will not positively guarantee that it is certainly a lucky ring that you will take a pride in wearing. They were made for sell at 50 cents, but as a special bargain we will supply them to customers mentioning this paper at the low price of ONLY 20 CENTS, postpaid. JOHNSON SMITH & CO.

SQUIRT RING



You may have a lot of fun with One Dollar worth of Squirt Ring. It consists of a hollow ring, plated ring, attached to a rubber ball, arranged that the latter is quite out of sight when the ring is in proper position. Both are attractive looking ring as this cannot be detected. While the victim is admiring the ring, a few pumps squeeze the rubber ball and the concealed water squirts in a very great quantity. PRICE 20c. Postpaid, 2 for 30c. Johnson Smith & Co., Dept. E 6, 3224 N. Halsted St., Chicago

Wonderful X-Ray Tube

A wonderful little instrument producing optical illusions both surprising and startling. With it you can see what is apparent y the bones of your fingers, the lead in a lead pencil, the interior opening in a pipe stem, and many other startling illusions. A mystery that no one has been able to satisfactorily explain. Price 10 cents, 3 for 25 cents; 1 dozen, 75 cents. Sent by mail, postpaid.

Sneezing Powder

Place a very small amount of the powder in the back of your friend's coat collar. How it tickles the air, and everyone in the room or railroad coach is bound to sneeze without knowing the reason why. It is most amusing to hear their remarks, as they have not the least idea of the cause, but think they have caught it one from the other. Every one laughing and sneezing you yourself will be taken for the cause of your life. The serious, pompous meetings, as they adjourn, will be all over—there is a gathering of people. It is the greatest joke of the year. Price postpaid 15 cents; 3 for 30c. JOHNSON SMITH & CO.

STAGE MONEY

With a bunch of these bills, it is easy for each person of limited means to appear prosperous. By flashing a roll of these bills at the proper time and peeling off a genuine bill or two from the outside of the roll, the effect created will be found to be all that can be desired. Prices postpaid: 12 Bills 10c; 50 Bills 25c; 125 for 50c or $3.50 thousand.

NEW BOOK ON ROPE SPLICING

USEFUL KNOTS, HITCHES, SPLICES, ETC.

How Different Knots Are Made and What They Are Used For. Knots to Use and Knots to Avoid.

A most practical handbook giving complete and simple direction for making all the most useful knots, hitches, rigging, splices, etc. Over 100 illustrations. All about wire rope attachments, lashings, hitches, etc. 27 Heraldic Knots illustrated. Of great value to mechanics, riggers, campers, boatmen. Price 20c p. pd.

Johnson Smith & Co., Dept. E6, CHICAGO

LUMINOUS PAINT

Make Your Watches, Clocks, Etc., Visible by Night The very latest discovery in the scientific world. Will never tarnish. Quite unobtainable except at an exorbitant price, we have at last succeeded in producing a LUMINOUS PAINT, which, applied to the surface of any article or object of entire light, rendering it positively visible in the DARK. THE BRAVEST THE NIGHT, THE MORE BRILLIANT IT SHINES. Quite simple to use. Apply a little upon the dial of your watch or clock and enable you to tell the time by night. You can paint the push buttons of electric bells, match boxes, and innumerable other articles, make your door knobs visible, and in fact, a little mixing of this luminous paint will enable you to make numerous articles. Price 25c. Larger size 50c and $1.00 postpaid. Johnson Smith & Co., Dept. E 6.

MUSICAL KAZOO

With the Musical Kazoo you can, without practice whatever, play any piece of music you whistle or hum, play a solo right from the start, imitate any band or entire orchestra, sing songs, dance, etc. Nothing to learn. It is simple to operate. Anybody can do it. Produces excellent music. You do not blow into it, but sing, speak, whistle or hum and a most delightful imitation is heard which astonishing results at parties, meetings, home, club or camp. Entertainments, dances, serenades, picnics, outings, excursions, fun the living for children and others. Invaluable for clubs, lodges, etc. A perfect toy for children or instrumental accompaniment, either with or without other musical instruments. Price 10c p. pd.

MAGIC FLUTE

Wonderfully Sweet Toned and Musical

A marvelous musical instrument. This instrument produces genuine music, whether it be the joyous notes of a quick step of the gay and charming hornpipe fact, any class of music can be played upon the Humana tone without practice, as it is simply a self-playing instrument. When played with a piano accompaniment, or any other musical instrument, the effect is charming. Full printed instructions for playing sent with each instrument. Price 15c postpaid.

MOVING PICTURE MACHINE

Uses Standard Films same as the larger machines. Very easily managed. Simply turn the handle. Good Variety of Films always obtainable

PRICE Complete ONLY **$2.50** Postpaid anywhere including Two Films

Extra Films, 15c each postpaid

THIS IS A GENUINE MOVING PICTURE MACHINE and the motion pictures are clear, sharp and distinct. The Moving Picture Machine is finely constructed, and carefully put together by skilled workmen. It is made of Russian Metal, has a beautiful finish, and is operated by a finely constructed mechanism. The projecting lenses are carefully ground and adjusted, triple polished, standard double extra reflector, throwing a ray of light many feet, and enlarging the picture on the screen up to three or four feet in area. The light is produced by a safety carbide generator, such as is used on the largest automobiles. This throws a dazzling white light on the screen.

It is a solidly constructed and durable Moving Picture Machine. The mechanism is exceedingly simple and is readily operated by the most inexperienced. The pictures shown by this marvelous Moving Picture Machine are not the common, crude and lifeless Magic Lantern variety, but are life-like photographic reproductions of actual scenes, places, and people which never tire his audiences. This Moving Picture Machine has caused a raising enthusiasm wherever it was used.

JOHNSON SMITH & CO.

Dept. E 6 3224 N. HALSTED ST., CHICAGO

ANARCHIST BOMBS

Consists of a little glass vial, containing a liquid form a chemical so fierce that it will produce a most horrible odor. One dropped in a room full of people will cause mere consternation then a hurried exodus. The smell will entirely disappear in a short time. 3 Boxes for 25c, shipped by express only with a Dollar's worth of other merchandise.

ITCHING POWDER

This is another good practical joke. The intense discomfiture of your victims to endeavor but themselves to thoroughly enjoyable. All that is necessary to start the ball rolling is to deposit a little of the powder on a person's hand and the latter can be relied upon to do the rest. The result is a vigorous scratch, then some more severish, and still some more. 3 Boxes for 25c. Sent only by express. (Must order at least One Dollar's worth of other merchandise.)

"The Baby" Double Action Hammerless Revolver

A HANDSOME AND MOST EFFECTIVE WEAPON

$5.50

Measures but 4¼ Inches long

Takes regular .22 calibre cartridges

The new Baby Double Action Hammerless Revolver has been produced to meet the ever increasing demand for a revolver that would combine small size and light weight with the essential features of efficiency and practicability. It is small in size, yet is just as effective and serviceable as the most expensive weapon you can buy. Every lady should have a revolver and should know how to use it, and there is no safer or better one made than this. A great feature is its safety action the finger against accidental discharge, making it quite safe for young men and ladies. The illustration gives an idea of its appearance. It is nickel plated and used to be thoroughly appreciated. The ammunition used is the standard .22-calibre (short) cartridge obtainable anywhere, or you can have the cartridges from us (cartridges can be shipped only by express). The revolver fires ten shots in one loading. The operation of the firing mechanism is extremely rapid and absolutely reliable; six well aimed shots can be fired in about ten seconds. The revolver is very well constructed, with finest nickel plated fluted barrel of cylinder, and weighs only 4½ ounces. The Price of the Baby Revolver is only $5.50, sent by mail postpaid to any address. JOHNSON SMITH & CO.

THE EXPO WATCH CAMERA

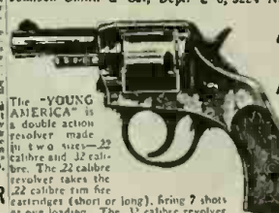
The most wonderful and ingenious Camera made

It is but little larger than a watch, which it closely resembles. You can carry the Expo about in your pocket and take pictures without any one being the wiser.

One Cent a Picture

The Expo loads in daylight with 25 Exposure Films, costing 25c, thus the picture taking part of a whole day's outing may be had for the nominal sum of 1c—One cent a picture. 10 Exposure Films obtainable, it is supplicity itself to operate. Takes pictures through the view, where the Rapid Fire Lens is located. The photos (3/8 x 7/8) may be enlarged to any size.

Price **$2.50**



QUICK AS A FLASH

Time and Instantaneous shutters! Weighs but 8 ounces; nickel plated. Endorsed by amateurs and professionals the world over. Thoroughly practical—printing and developing of films just the same as ordinary camera—is daily use by the police, newspaper reporters, detectives, and the general public. Important tests have been secured with the Watch Camera by enterprising reporters on metropolitan newspapers, which have proven indoors or outdoors equal to any camera sold in the market, else or price notwithstanding.

Expo Watch Camera **$2.50** FILMS, 10 Exposures 15c, 25 Exposures, 25c

Johnson Smith & Co., Dept. E 6, 3224 N. Halsted St., Chicago

"YOUNG AMERICA"

Double Action REVOLVER

.22 and .32 CALIBRE

A GOOD POCKET GUN

The "YOUNG AMERICA" is a double action revolver made in two sizes—.22 calibre and .32 calibre. The .22 calibre revolver takes the .22 calibre rim fire cartridges (short or long), firing 7 shots at one loading. The .32 calibre revolver takes .32 calibre S. & W. center fire cartridges, and accommodates 5 shots in the cylinder at one loading. Blank cartridges may be used if desired, indeed, there are many who use nothing else but blanks. You can take direct aim at a burglar and fire without causing bodily harm, yet the effect is usually the same, and the vagabond makes off, congratulating himself on his lucky escape. The "Young America" weighs approximately 9 ounces, and is one of the lightest weight revolvers of its type on the market. It is an excellent house arm or pocket weapon, and the most popular Fourth of July revolver. Octagon Barrel, accurately rifled, made of best steel, very highly nickel plated and polished. The handle is of fancy hardened rubber, but we can supply pearl handles that are beautiful and extremely popular, instead, if desired, at an additional cost of $2.00. The PRICE of the "YOUNG AMERICA" DOUBLE ACTION REVOLVER is $6.75. We pay postage anywhere. Johnson Smith & Co., Dept. E 6

Mysterious Trick Cards

This is one of the very best Card Tricks imaginable. It is very easily learned, simple to perform, yet most mystifying. You make the same cards change completely not less than five times. Full directions with each trick. Price, only 10 cents, or three for 25 cents postpaid.

Johnson Smith & Co., Dept E 4

THE "LITTLE GIANT" TYPEWRITER
A First Class Writing Machine For $1.25

A perfect little typewriter for $1.25. There are thousands of persons who would like to use a typewriter but where needs a full sized machine do not warrant the expense at either to the purchase and operation. To such persons we confidently recommend our Little Giant. It is extremely simple in construction, so that anyone can quickly learn to operate it and write as rapidly as they would with pen and ink. The letters of the alphabet most frequent y used being so grouped as to enable one to write rapidly, the numerals, 1 to 10, and the punctuation marks being together. With this machine your son, your daughter, your best girl (provided you have letters, address envelopes, make out bills, and do almost any kind of work not requiring a pen or pencil) can be supplied. With each typewriter we send a tube of ink and full printed instructions for using the machine. Price complete $1.25 by mail postpaid.

One of fifty or seventy-five dollar machine

SERPENT'S EGGS

Each box contains 12 Eggs, which are no larger than a grain of oats. When lit with a match, however, each one gradually hatches itself into a Snake several feet long, which curls and twists about in a most lifelike manner. Price per box 10c, postpaid. Johnson Smith & Co.

MYSTIC SKELETON

A jointed figure of a skeleton 14 inches in height, will dance to music and performs various motions and movements while the operator may be any distance from it. The figure may be manipulated by the spectators. When a hundred feet or so from the operator it is simply placed on a chair or table, when it will mysteriously become endowed with life, and commence to dance, etc. We send full direction with each skeleton, if the aid of which anyone can readily make it perform. 10c postpaid.

CIGARETTE ROLLER

Very neat and handy. Weighs less than a quarter of an ounce. It makes better cigarettes than you can buy and makes them easily and quickly. Just the tobacco you prefer and three bare cigarettes than ready made, and more of them, for the price of about half of your money. Just try one and make cigarettes just to your own liking. Price only 10c or 3 for 25c postpaid, with full instructions for use. JOHNSON SMITH & CO.

MIDGET ILLUSTRATED BIBLE
A Great Curiosity

The Smallest Bible in the World

The Midget Bible is a perfect gem, and a work of art. It is small enough to go in the size of a postage stamp and contains TWO FULL SIZED BOOKS AND FIFTY PAGES of the NEW TESTAMENT, profusely illustrated. The Midget Bible is a wonderful little book to send to bring good luck to the owner. Must be seen to be appreciated. Price, only 12 cents, three Bibles for 30 cents, one dozen Bibles for $1.00 or 100 for $8.00. Good money can be made selling these Midget Bibles amongst friends, church acquaintances, Sunday schools, bazaars, etc. Send for a few and try it.

The CONJURER'S CASKET

Apparatus and Directions for a Number of Mysterious Tricks Enough for an Entire Evening's Entertainment

ANYONE CAN DO THEM

50c

It is great fun mystifying your friends. Get this Conjurer's Cabinet, and you will be the cleverest fellow in your district. It contains the apparatus for 12 tricks, including The Disappearing Rose, that, when placed on the lapel of your coat, vanishes from sight at will; the Magic Vase and Ball Trick; a Wonder Ball to travel through a solid table; a Coin Vanished and is found in someone else's pocket; The Magic Wand with which you can apparently eat your finger almost to the end; the Wonderful Card Trick to card is placed in an envelope, and when opened an entirely different card altogether is found. The Disappearing Coin Box (a coin is placed in the little wooden barrel, and when opened a spot is found to have vanished entirely, or can be made to change to a coin of another denomination.); The Famous Mesmerized Penny that defies the law of gravitation (suspends from the palm of the hand, nose, cheek, wall, ceiling, etc.); The Glass Goblet and Vanishing Coin Trick (a coin is dropped into a glass of water, and when the water is poured out the coin has vanished); With the seven tricks described above we send full printed instructions for performing each trick, so that anyone can readily perform all the tricks to the great amusement of their friends and the public. Any boy or girl interested with this Cabinet of Tricks in his possession, can give a parlor entertainment not inferior to some regular magicians. Besides the tricks mentioned in the Cabinet, there are twenty-five other feats and illusions fully explained with full printed instructions, for which you can easily make or procure the necessary apparatus. Among them are The Mouse in a Pack of Cards, The Dream Card, The Hot Trick, To Knock a Tumbler Through a Table, One Cent Robbed Into Two, To Find the Number Thought of, Mysterious Wedding Ring etc. We also send the secret of performing three wonderful stage tricks, as follows: The Art of Cremation, The Vanishing Coin, Walking Out of a Room, and The Disappearing Lady (explained with an article of legerdemain and valuable hints to amateur conjurers. PRICE COMPLETE ONLY 50 CENTS.

JOHNSON SMITH & CO., Dept. E 6, 3224 N. Halsted Street, CHICAGO

The Newest Novelty Aerial Balloon

Flies gracefully in or outdoors. This is the VERY LATEST SENSATION IN BALLOONS. A brightly colored balloon that measures sixteen inches in length when inflated. It is blown up in the usual manner, and when released, the air pressure sends the balloon SOARING UPWARD like a big inch propeller SPINNING AROUND AT A LIVELY RATE. The effect is startling. It is a graceful act that makes the onlookers WILD WITH JOY. May be used repeatedly indoors or outdoors. An immensely interesting toy. Price 10c each, 3 for 25c postpaid.

JOHNSON SMITH & CO., Dept. E 6, 3224 N. Halsted Street, CHICAGO

New Vamping Card

PIANO PLAYING MADE EASY

No Teacher Needed Surprisingly Simple System

Persons having neglected their Musical Education need not despair, for with the aid of our new "VAMPING CARD" (owning the card portrayed over the piano keys), you can at once Vamp away to thousands of Songs, Ballads, Waltzes, Rag Time, Etc., etc., like a Professional Musician. No knowledge of music is required. After using it a few times, you will be able to dispense with the aid of the Vamping Card entirely. Only 10 cts. postpaid. Johnson Smith & Co., Dept E 6

The Hamilton Breech-Loading Rifle

A LONG RANGE LOW PRICE SMALL BORE

Will Kill Up To 200 Yards

Accuracy of Centering Insures Great Penetration

22 CALIBRE 16 IN. BARREL

PRICE ONLY **$4.75** Postpaid to any address

FIGHTING ROOSTERS

A full-blooded pair of fighting game cocks for ten cents. These lifelike fighting birds are real feathers, yellow legs and fiery red combs, their movements when fighting are perfectly natural and lifelike, and the secret of their movements is known only to the operator who can cause them to battle with each other as often and as long as desired. Independent of their fighting peculiarities they make very pretty mantel ornaments. Price for the pair in a strong box, 10 cents, 3 pair for 25 cents, by mail postpaid. Johnson Smith & Co.

LOADED CIGARETTES

Just Like Ordinary Cigarettes, But Such Bad Cigarettes!

A boy containing ten apparently genuine Cigarettes. They contain a cap which explodes when about one-third is smoked.

They appear so real, and afford as good a smoke (while they last) that the victim is taken entirely by surprise. A great laugh producer and entirely harmless. Price, box of ten, 20 cents, postage 6 cents.

JOHNSON SMITH & CO.

Potmend

Stops a leak in a minute

The finest repairer for ironware, Agateware, Enamelware, etc. Good for kettles, pots, pans, boilers, and every kind of ironware, also for tin, copper, aluminum, ice boxes, iron pipes, cracks in stoves, broken china, porcelain, price-lists, bisque, crockery, woodenware, marble, etc. Will not chip, fly, burn, bake or boil out. THIS MEANS IS THE STRONGEST EPOXY IN THE POT. Could not be simpler: just mix the powder with water. HARDENS LIKE IRON. Fire-proof, Water-proof. You can fill a big hole or a small crack. Mended places stronger than new. Replaces chipped enamel. Anyone can do it: FAILURE IS IMPOSSIBLE. Better and easier than solder. Three sizes, 10 cents, 25 cents and 50 cents.

Johnson Smith & Co., Dept. E 6 3224 N. Halsted St., Chicago

www.americanradiohistory.com

The Alkaline Storage Battery

(*Continued from page 878*)

Consequently the engine would have to be operated at various rates and at all times. This is uneconomical. By using a storage battery one may arrange to run the engine at its most economical (full load) rate and thus effect a saving to offset more or less completely any loss of current resulting from the use of a storage battery between the generator and the lights. Further, the storage battery tends to improve the character (the steadiness) of the light. With a small installation where the current passes directly from the dynamo to the wires supplying current to the lights, the latter are apt to manifest undesirable fluctuations in brilliancy because of irregularities in the running of the engine. By using a storage battery, one is able to use this fluctuating current in charging and then to get an even current from the battery.

A shunt-wound dynamo is the thing to use—else, when the voltage of the battery rises too high, it may "back up" and operate the dynamo (series type) as a motor, causing considerable damage. If a compound dynamo is already installed, or if it is desired to use such a machine for charging storage batteries, it can be done simply by disconnecting the series windings on the field coils, thus converting the machine into a shunt dynamo.

The dynamo which is used to charge a battery should always have an excess voltage capacity. Thus, if we are going to use a battery of 30-32 volts rating, it is good practise to employ a 45-volt dynamo for charging. In fact, we may largely consult convenience when charging a battery, provided we use a high voltage rather than a low one. A 110-volt dynamo may be employed, at times, for charging a 30-32-volt battery, thru a suitable resistance; tho perhaps it will not be the best thing to do.

The alkaline battery with which we are concerned is made up in a variety of sizes, of which that known as "A" is quite popular for electric automboiles and trucks. A numeral used along with the letter indicates the number of positive plates used in the cell. These numbers furnish a rough gage by means of which the comparative capacities of this type of cell may be determined. The reason underlying this is that amperage is determined by the total area of plate surface exposed to the action of the electrolyte. An A4 cell will have about half the capacity of an A8 cell, etc.

Charging.

The *positive terminal* of the battery is conected with the *positive line* of the supply current; and the *negative terminal* with the *negative line*. The positive pole of this type of cell is indicated by a *red bushing* and also by a + mark stamped in the metal of the container. A black bushing is used for the negative pole. A further means of determining the positive and negative poles is by means of the *form* of the little containers in the plates. The round tubes belong to the positive plates, and the flat pockets to the negative plates. If substantial heating is noticed at or near a cell pole during the charging operation, it is to be taken as indicative of an imperfect connection. If, however, all the connections are tight, then disconnect and determine whether there is dirt present and whether the metallic contacts are flat and rigidly clamped.

If there is any doubt as to which is the positive wire of the dynamo and which is the negative wire, the following simple test is recommended:—Connect one wire of the generator with some form of resistance. The free end of the unconnected wire of the resistance and the free end of the unconnected wire from the generator may now be brought close together in a cup of salt water. In a moment one wire-end will begin to turn bright. Bubbles will form at this wire. This is the *negative* one. The other is, naturally, the *positive* wire.

Normal Amount of Electrolyte.

The proper amount of electrolyte is such that plates will be ½ inch below the surface. During the charging operation the attendant evolution of gas will be likely to create a transient level. Tests for the level are to be made after the charging is all completed and the liquid has settled down. As it may not be easy to see conditions inside the cell, a good way to determine the depth of liquid over the plate tops is to use a piece of straight glass tubing with a bore of, say 3/16 inch or more. Introduce one end of the tube, holding it vertical, until the bottom of the tube is on top of a plate. Then close the top of the tube with the forefinger and withdraw the whole. At the bottom will be found a column of electrolyte whose height will be the depth of liquid over the plate top. When the right amount of electrolyte is in the container, this column will measure ½ inch. Simply a glass tube is required. No rubber cap or tube is needed in addition and the tube of an ordinary fountain-pen filler may be used. The rubber bulb is removed and the larger end of the tube is inserted into the electrolyte. The operation of charging, as already intimated, involves the production of gas. Some, at least, of this gas comes from the decomposition of water in the electrolyte into its constituent gases. These gases will naturally be lost, and the result will be a slight reduction in the total volume of the electrolyte in the container. Consequently, a very proper time to examine for height of solution is *subsequent to charging*. The remedy for this loss and any other loss due to withdrawal of water (as, for example, by natural evaporation) is the addition of pure water.

Adding Water.

When water is to be added to the contained electrolyte to bring the surface to the required height or to correct a solution that has become too strong, a special appliance—the "electric filling outfit"—may advantageously be employed. Only *distilled water* is to be used, whatever the method of introducing it. Of course, do not add water during charging, for the reason that the level can not be exactly determined at that time, as already explained. The addition of water will not, ordinarily, be required every time the battery is used. Usually, once or twice a week will be sufficient, unless the operation of the battery is very considerable. Other things being equal, water will be necessary oftener when the *constant current* method of charging is used instead of the *tapering current* method.

Two Methods of Charging.

To charge by what is known as the constant current method the rheostat is set a few amperes higher than the current it is proposed to deliver. The amperage will fall off as the charging goes on, but by readjusting the rheostat every 30 minutes or so to a point somewhat higher than the average desired, a fairly even flow may be maintained. To charge by what is known as the tapering current method, the rheostat is set a considerable amount above the desired average, say 50 per cent, and the current delivered without further adjustment. At the end it is proper that the current should be considerably below the average. An advantage of this method is the relief from attention during the charge.

LISTEN TO ME!

Be A CERTIFICATED ELECTRICIAN

THIS IS YOUR CHANCE OF A LIFE TIME

I am Chief Engineer of the great Chicago Engineering Works. I am in close official touch with the electrical world. I know how badly we need trained electricians who can take charge of important work as experts. Right now there is such a need for executive electricians that I am making a special effort to help meet the demand. I am publishing this special announcement to secure a certain number of ambitious men whom I will personally train by mail for the wonderful opportunities that are open.

I WILL MAKE YOU a Trained Electrician

I don't care how young or old you are, just as long as you can read and write and have a spark of ambition. I don't care where you live or what you do. I don't care if you don't know a blessed thing about electricity. Just give me a little of your spare time for a short period and I'll show you the quick way to success in electricity. You can qualify to earn **$36 to $100 a week** with opportunities for greater earnings.

I Train You by Mail!

Your spare time will do. No interference with your regular duties. I understand just what you must know and I have devised a wonderful way of instructing by mail. I positively guarantee your satisfaction.

Free *Wonderful Electrical Outfit*

Absolutely free. Not a penny cost to you now or later. To those who act at once I will give a wonderful set of Electrical Equipment with my compliments. Write me at once. I have only a limited number of sets to be given free. Drop me a post card or letter.

Write! You will have to act quick to get in on this opportunity. Write me today for full particulars. Drop me a post card. *Write Now.*

February 24, 1919.

Mr. R. W. DeMott,
Advertising Manager,
THE ELECTRICAL EXPERIMENTER,
233 Fulton Street,
New York City, New York.

Dear Sir:

We take great pleasure in stating that our advertising in your classified department has been very successful.

To tell the truth, we have received more returns and at a lower cost than any medium that we are using.

Sincerely yours,

NATIONAL AERO INSTITUTE,
(Signed) John A. Tenney,
President.

Is This Your Idea of Florida? A little piece of land near the water, a boat, a garden, some strawberry plants, and perhaps a few chickens; a vine-covered cottage, pleasant neighbors; fish and oysters in abundance. plenty of quail and game—a simple, natural, wholesome life in the open the year round—Home, Health and Contentment. All this is within your reach at modest outlay in this beautiful land of sunshine and roses. We are on the Gulf and a navigable river; also on the Dixie Highway. Here we have the freedom, comfort and economy of country life, yet are only two hours by motor bus from big cities and resort centers like Tampa and St. Petersburg. Our community is new, but is one of the fastest growing in the State. Prices have not gone sky-high and living expenses are moderate. 100 Northern families already here. They like it—perhaps you will. May we send complete information? Board of Trade, Box 298, New Port Richey, Fla.

E. back numbers on hand as follows: 1915—Jan., March, April, May, June, July, Aug., Sept., Oct., Nov., Dec., price each 35c. 1916—Jan., Feb., March, May, June, Sept., Dec., price each 35c. 1917—Jan., April, May, Aug., Nov., Dec., each 35c. 1918—Jan., Mar., 35c; 1918—May, June, July, Aug., Sept., Oct., Nov., Dec., each 20c. 1919—Jan., Feb., Mar., 20c. We can fill orders at once upon receipt of your remittance, and if you have not these numbers already, now is your chance to get them, as they probably will be snapped up very quickly. Experimenter Publishing Co., 233 Fulton St., New York City.

Sexual Knowledge—By Dr. Faulkner. Plain facts about sex matters. Over 100 pages valuable information for men and women, married or single. Price 25c, in plain wrapper. United Sales Co., Springfield, Ill.

Leading Magical Magazine. You'll like it! All magicians do! Why? The value is there. Sample 10c; three months, 25c; year $1.00. The Eagle Magician, Dept. E, Minneapolis, Minn.

"Nature Book" facts every married and engaged person should know. 35c. Central Company, 599 Ninth Avenue, New York.

Blue Prints.

Blue Prints: ½ H.P. Gas Engine 30c, ¼ H.P. Steam Engine 50c, ⅛ H.P. Boiler and Engine 70c, all 3 $1.00. Circulars for stamp. Universal Gas Motor Co., 364 Monadnock, Chicago.

Blue Prints of Motor windings. 108 A.C. connections, 132 D.C. armature windings, complete 240 diagrams $5.00 cash. Send 25c for 12 samples or write for particulars. Charles L. Chittenden, 811 West 18th Street, Kansas City, Mo.

Make volt and ammeters. Simple practical instruction and blue print 25c. D. R. Hansell, 2328 N. Carlisle Street, Philadelphia, Pa.

Health.

Enjoy Vigorous Health. My new book "Muscular Development" tells how. Send for it today—10c. Earle Liederman, Dept. A, 203 Broadway, New York.

Tobacco or Snuff Habit Cured or no pay; $1.00 if cured. Remedy sent on trial. Superba Co., SA, Baltimore, Md.

Pyorrhea—H. E. Kelty, D. D. S., M. D., pyorrhea specialist for 15 years, has developed a successful home treatment for pyorrhea. Purifying, healing, preventative. Full month's treatment and booklet $1.00. Circular free. Dr. H. E. Kelty, 106 Gladwin Ave., Leonia, N. J.

Cigarette, pipe or chewing habit conquered. Nature's method. Guaranteed. Write for free brochure. Edw. J. Woods, TA-300, Station F, New York.

Stammering.

St-Stu-t-t-tering and Stammering cured at home. Instructive booklet free. Walter McDonnell, 105 Potomac Bank Building, Washington, D. C.

For the Hair.

I was Bald. Obtained hair growth by an Indian's ointment containing genuine bear oil and rare plant juices. Many others have good hair-growing results. Will send box, postpaid, with recipe, 10c. John Hart Brittain, 150 E 32nd St., BA-300. New York.

Tricks, Puzzles and Games.

Tricks, Puzzles, Jokes, Toys, Games, Novelties, Doll and Cane Racks, Plays, Wigs, Stage Supplies, Escapes and Illusions. Large 1917 catalog free. Oakes Magical Co., Dept. 549, Oshkosh, Wis.

1000 Stage Tricks with 500 illustrations. Catalogue 10c, small catalogue free. Hornmann Magic Co., Sta. 6, 170 Eighth Avenue, New York.

Black Art Hindoo Experiments, 1919 Edition, 25c. Invisible Ink. Free Trick. Catalogue each order. Linhorst Magic X Shop, St. Louis.

Ventriloquism taught almost anyone at home. Small cost. Send today 3c stamp for particulars and proof. O. A. Smith, Room R-605, 801 Bigelow Street, Peoria, Ill.

100 Kinds Wire and Steel Puzzles. Catalog and leader 10c postpaid. Western Puzzle Works, St. Paul, Minn.

Phonographs, Needles and Supplies

Build Your Own Phonographs and manufacture them for profit. Drawing instructions, Parts, Price List, Blue Prints, etc., complete, sent free upon request. Write today. Associated Phonograph Co., Dept. E-1, Cincinnati, Ohio.

Build Your Phonograph. "Perfection" high-quality spring and electric Motors, Tone Arms, Reproducers. Wonderful results. Big saving. New catalog and building instructions mailed for ten cents. Indiana Phonograph Supply Co., Indianapolis, Indiana.

Phonograph Owners: Test our wonderful, new Ring Point needles. Buy at wholesale prices and make money selling to your friends who hear how they improve tone. Scientific method, important discovery, very interesting. Single needle plays 100 records. Send 25c for samples and special offer. K. Kenyon Company, 31 Union Square, New York.

Wonderful $75 Phonograph. 42 inches high, 12-records album, needles, $45. Stamp. 631 Newhall, Milwaukee, Wis.

Motors, Engines and Dynamos.

Small Motors and Generators: 1000 New Motors and Generators from Bankruptcy Stock, ¼ H. P. A. C., $18.50 each; ½ H. P., $30.00. Battery Charging Sets—Robbins & Myers new outfits, all sizes, $30.00 each and up. Charging, Lighting and Moving Picture Arc Generators, $10.00 each and up. Motors for all phases of current. Immediate delivery Less than ½ regular prices. Write for late bulletin. Johnston, West End, Pittsburgh, Penna.

For Sale—The following 60 cycles, single-phase motors, 1800 r.p.m., new. 25-⅛-110 volts, 3½ h.p., 220 volts, 2¼ h.p. 220 volts, 2-1 h.p. 220 volts, 1-1½ h.p. 220 volts, 2-2 h.p. 220 volts. Electric Machinery Equipment Co., 714 W. Van Buren St., Chicago.

Wanted for Cash—Marine, rowboat, stationary, automobile, motorcycle engines or bicycle attachment motors. State condition, price, etc. Write, A. J. Temps, 305 Broadway, New York City.

Printing.

100 Bond Noteheads, 4 lines and 100 envelopes, prepaid, $1.00 Southwestern, 1413-H Berendo, Los Angeles.

100 Engraved Style Visiting Cards 50c; 100 Emblem Cards 70c. H. Gregory, Warwick, N. Y.

Stamps and Coins.

500 Finely Mixed United States or Foreign Stamps, 12c. Philatelic Star, Madison, N. Y.

California Gold, Quarter size, 27c; Half-dollar size, 53c; Dollar size, $1.10; Large cent, 1820, and catalogue, 10c. Norman Shultz, Kings City, Mo.

Stamps—61 all different free. Postage, 3c. Mention paper. Quaker Stamp Co., Toledo, Ohio.

Free—Packet Valuable Stamps to applicants 50% approvals. Benj. Forbes, 160 Devilliers, Pittsburgh, Pa.

Free packet of stamps to approval applicants. Laskaris, Union City, Pa.

Stamps 100 different, 8c; 200, 23c. Approvals. Michaels, 5600 Prairie, Chicago.

Acme Stamp Co.—Send stamp for pocket list. 494 12th St., Brooklyn, N. Y.

For Advertisers.

"Quick-Action Advertising—How it is Building Business for the Progressive Advertisers of America"; A little story of results told by the advertisers themselves—not the publisher. You will be interested in reading this little booklet which we have prepared for prospective advertisers, a copy of which will be gladly mailed to you upon request. It tells you how to talk business with 1,000,000 intelligent, interested and responsive Americans every month—men who know what they want and who have the money to buy it. Write for particulars and rates today. Douglas Wakefield Coutlee, 225 West 39th St., New York.

www.americanradiohistory.com

SKINDERVIKEN TRANSMITTER BUTTON

$1.00 ppd.

YOU can easily make a highly sensitive detectophone by using a Skinderviken Transmitter Button to collect the sound waves. You can build your own outfit without buying expensive equipment. Think of the fun you would have with such an instrument! It's very simple, too, and inexpensive.

You can install an outfit in your home and hear the conversation being held all over the house. You can connect up different rooms of a hotel. *Our outfit was used by secret service operatives during the War. It is being used on the stage.* So much for its commercial adaptations! *You* can procure apparatus of the same type.

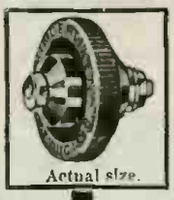

Fig. 3

Fig. 6

One of the main advantages of the Skinderviken Transmitter Button lies in its ultra-sensitiveness. You can place it in any position you like. It is the greatest invention in micro-phones and has won recommendations from men of high standing in the scientific world. It is being used all over the world. You can mount it most anywhere. In figures 3, 4 and 5 are shown some unusual and practical methods. Card board boxes, stove pipes, stiff calendars and hundreds of other places will suggest themselves to you. The buttons cannot be seen by any one in the room as they are so small and light. Only a small brass nut is exposed to the view.

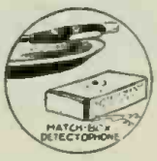

Fig. 4

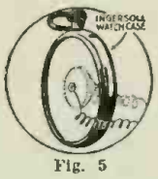

Fig. 5

BARGAINS

These prices are very low

All equipment is GUARANTEED. The apparatus is the same as sold by us to large telephone companies. 110 volt telephone generators.

3 bar	$1.75	Weight	6½ lbs.
4 bar	2.25	"	8 lbs.
5 bar	2.75	"	10 lbs.
Ringers 80 ohm	.35	"	1 lb.
" 1000 ohm	.75	"	1 lb.
Silk cords, 6 ft. 3 cond.	.20	"	3 oz.
" " 6 ft. 4 cond.	.20	"	3 oz.
" " 3 ft. 2 cond.	.10	"	1 oz.
Transmitters complete with Steco transmitter button	$1.50		12 oz.
Induction coils	.35		6 oz.

Full directions for connecting up the button for use as a detectophone are given in booklet No. 4 which is sent with each button. Figures 1 and 2 of this advertisement, two of the many illustrations in booklet No. 4, show the circuit connections of the detectophone.

The only instruments needed to complete a detectophone outfit, in addition to a Skinderviken Transmitter Button are a receiver, battery, and, if desired, an induction coil.

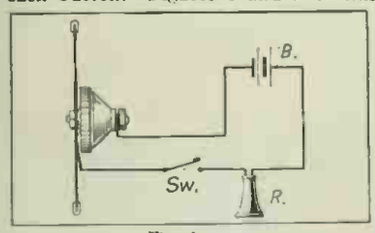

Fig. 1
Transmitter Button mounted on Diaphram. Simplest circuit.

AMONG electrical experimenters the button has created a sensation. It is not uncommon to receive unsolicited letters like these: "I received transmitter button today and I wish to inform you that it works great and is *the best I have ever seen or heard of for the price.* I will certainly recommend it to my friends. I wish to thank you for your good service."

$1.00 ppd.

"I have been using one of your transmitter buttons, and it has proved to be worth more than its value in my experimenting." "I received one (Transmitter Button) some time ago, and they are just O. K. for experimentary." "I bave been using one of your transmitter buttons for experimental work and it certainly lives up to all you say for it *and then some.*"

Fig. 7

Mr. H. Gernsback, editor of this magazine, who is the dean of electrical experimenters, said: "In writer's opinion, obtained by actual elaborate tests, your Transmitter Button is probably most efficient device of its kind on market today, due to its simplicity and other outstanding features. Should have a great future."

Figures 6, 7 and 8 suggest some very interesting experiments. That of reproducing music at a point far removed from the phonograph is very popular with experimenters. The Skinderviken Transmitter Button is mounted in a very small hole in the under side of the sound arm. (Note: This hole will not injure the quality of the music.) When the phonograph is being played, the sounds produced are transformed by the Skinderviken Transmitter Button into a varying electrical current. The receiver, which is located in another room, reproduces the music at that point.

Fig. 8

Figures 7 and 8 illustrate the methods of transmitting sound by means of the vibrations in a body while speaking. Speech will be reproduced by the receiver just the same as if the experimenter had spoken into a transmitter. In these experiments the Skinderviken Transmitter Button is mounted on a small iron disc.

The same circuit connections apply to all experiments, regardless of how the transmitter button is mounted.

The Skinderviken Transmitter Button operates on one or two dry cells. It often happens that two cells produce too much current and the sounds are deafening. We recommend either one fresh cell or two worn out cells.

We have the utmost faith in our transmitter button. We guarantee satisfactory service or we will refund the purchase price. Boys — Young and old—send in a dollar bill RIGHT NOW! You can't lose. If you're not satisfied, you receive your dollar back. Isn't that fair?

Send a 3c stamp for a copy of Booklet No. 4.

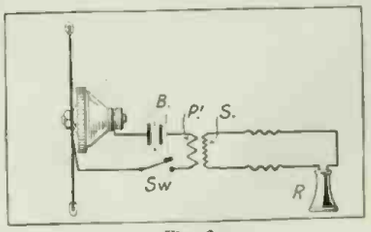

Fig. 2
Transmitter Button mounted the same but with Induction Coil.

OFFER No. 1

Wireless Course

The most comprehensive Wireless Course ever printed. Contains 160 pages, 350 illustrations. Size of book 6¾"x10". Very fine flexible cloth cover.

FREE with a year's subscription.
Add 5c for postage

OFFER No. 2

Experimental Electricity Course

This masterpiece contains 160 pages, 400 illustrations. Size of book 5"x9". Printed on extra thin paper, so book can be slipped into pocket. Handsome flexible cloth cover.

FREE with a year's subscription. Add 5c postage

OFFER No. 3

How to Make Wireless Sending Apparatus
By 20 Radio Experts

How to Make Wireless Receiving Apparatus
By 20 Radio Constructors

These books are by far the most successful wireless books on the market. Size of each book 5"x7", well bound on good book paper. Covers in two colors. We really cannot praise these books too highly. Each book contains 100 pages and from 88 to 90 illustrations. **BOTH** books **FREE** with a year's subscription. Add 5c for postage

This is a very limited offer. It may be withdrawn at any time, due to the tremendous cost of paper, which IS JUST DOUBLE WHAT IT WAS ONE YEAR AGO. We have only a limited supply of these fine books on hand; after they are gone we cannot reprint the books until conditions become normal again. **Now is your chance.**

The publishers of this journal have earned an enviable reputation of giving more than 100 cents' worth for each dollar spent with them. Profit by this liberal opportunity NOW; it may never be made again.

HERE'S THE OFFER

Subscribe to the ELECTRICAL EXPERIMENTER for one year, at the regular subscription price of $2.00 per year (Canada, foreign and N. Y. C. $2.50) and we will send you either books shown in one of the above offers. If you subscribe for two years, two offers will be given, etc.

If you are a subscriber at present take advantage of this wonderful opportunity anyway. If you do, we will extend your present subscription.

This Offer Limited. *Act Now.*

Every Electrical Man Wants These Books and we ship them for your inspection FREE

Flexible Covers — Handy Pocket-Size Volumes

10 Volumes — 3500 Pages — 4700 Pictures

$1 Per Volume

$1 Per Month

Just what you need to know to succeed in ELECTRICITY

EVERY electrician, every engineer, every mechanic should know about these wonderfully helpful instructive books, which give in plain words a complete working knowledge of electrical engineering in all its phases.

You run into some new electrical problem almost every day. The information you need to help you in your every day work is in

HAWKINS ELECTRICAL GUIDES

These books place electricity at your finger ends. They cover every imaginable subject, principle, theory, problem, trouble, and way of doing things electrically. Every subject is indexed so that you can turn right to it. They are a study course and a reference guide in one, written in plain every day language—no wasted words—only what you need to know—chock full of up-to-the-minute electrical knowledge. The guides are a complete course in electrical engineering. They will help you in every detail of the day's electrical work. You can't ask an electrical question that Hawkins Guides can't answer.

Pocket-Size Flexible Covers

The books are small enough to slip into your coat pocket—handsomely bound in flexible black covers.

You can carry each volume with you until you have mastered its contents. 3,500 pages of actual information and 4,700 illustrations. Once you see these books and put them into actual use you will never again want to be without them. Try it at our expense.

SEND NO MONEY

It will cost you nothing to receive these books—to look them over—ask them all the questions you can think of—use them in your work—study them—pick up some information that will increase your earning ability. We will ship you the entire set of 10 volumes entirely FREE.

This is a sign of our confidence in the guides. Pure gold does not object to being tested. Keep them for seven days and if you do not decide that you can't get along without them, return them to us and owe us nothing.

When you decide to keep them you only have to pay $1.00 down and remit the balance of $9.00 on the easy payment of $1.00 a month till paid for.

Use this coupon to get the books. It will pay you many times over.

What Electrical Men Say

Helped Him Make Good

"It is only right for me to recommend highly the Hawkins Guides, for they have been of the greatest assistance to me in placing me in my present position as Superintendent of Construction Department of one of Ohio's largest Electrical Companies. I would like to see every man have a set of Hawkins Guides."
Geo. Knecht, Columbus, Ohio.

In the Naval Electrical Dept.

"The Hawkins Guides are great help to me in the Naval Electrical Department, which they cover very thoroughly."
C. J. Cornell,
U. S. Receiving Ship, Brooklyn, N. Y.

Superintendent

"I am now superintendent of the Dunnville Hydro-Electric Systems, and Hawkins Guides were a great help to me in holding down a responsible position."
W. E. Swartz, Dunnville, Ontario.

Wireless Operators

"I have worked wireless for ten years—but I wish I had these books years ago, as they have saved me a great deal of trouble." H. Marshall,
Steamer M & B No. 2,
Walkerville, Ont.

READ THIS PARTIAL LIST OF CONTENTS

No. 1 Contains 348 pages, 388 illustrations. Electrical signs and symbols—static and current electricity—primary cells—conductors and insulators—resistance and conductivity—magnetism—induction coils—dynamo principles—classes of dynamos—armatures—windings—commutation—brushes, etc.

No. 2 Contains 348 pages, 394 illustrations. Motor principles—armature reaction—motor starting—calculations—brake horsepower—selection and installation of dynamo and motors—galvanometers—standard cells—current measurement — resistance measurement — voltmeters — wattmeters—watt hour meters—operation of dynamos—operation of motors, etc.

No. 3 Contains 300 pages, 423 illustrations. Distribution systems—wires and wire calculations—inside, outside and underground wiring—sign flashers—lightning protection—rectifiers—storage battery systems, etc.

No. 4 Contains 270 pages, 379 illustrations. Alternating current principles—alternating current diagrams—the power factor—alternator principles—alternator construction—windings, etc.

No. 5 Contains 320 pages, 614 illustrations. A. C. Motors—synchronous and induction motor principles—A. C. commutator motors—induction motors, transformers; losses, construction, connections, tests—converters—rectifiers, etc.

No. 6 Contains 298 pages, 472 illustrations. Alternating current systems—switching devices—circuit breakers—relays—lightning protector apparatus—regulating devices—synchronous condensers—indicating devices—meters—power factor indicators—wave form measurement—switch boards, etc.

No. 7 Contains 316 pages, 379 illustrations. Alternating current, wiring power stations—turbines; management, selection, location, erection, testing, running, care and repair—telephones, etc.

No. 8 Contains 332 pages, 436 illustrations. Telegraph—simultaneous telegraphy and telephony—wireless—electric bells—electric lighting—photometry, etc.

No. 9 Contains 322 pages, 627 illustrations. Electric railways—electric locomotives—car lighting—trolley car operation—miscellaneous applications—motion pictures—gas engine ignition—automobile self-starters and lighting systems, electric vehicles, etc.

No. 10 Contains 513 pages, 599 illustrations. Elevators—cranes—pumps—air compressors—electric heating—electric welding—soldering and brazing—industrial electrolysis—electro plating—electro-therapeutic—X-rays, etc.

Also a complete 126-page ready reference index of the complete library. This index has been planned to render easily accessible all the vast information contained in the 10 electrical guides. There are over 13,500 cross references. You find what you want to know instantly.

THEO. AUDEL & CO.

Coming! A World Era of Opportunity for Trained Electrical School Graduates!

Do you realize that this country, and practically all of the civilized world as well, is today facing a period of unparalleled demand for electrical engineers and trained electrical school graduates? Has it occurred to you that thousands upon thousands of engineers and electrical men are going to be needed soon, both here and abroad, to rebuild Europe's industries and restore her war-shattered commercial life? Have you heard what President Wilson says about after-the-war engineering? "It is of first consequence to the country that there be an adequate supply of engineers for the period of reconstruction which must follow the war."—Woodrow Wilson.

Prepare Now for This Extraordinary Opportunity—Learn the Electrical Profession as it Is Taught in America's Most Practical Electrical Institute.

Whether you take up Electrical Engineering, Expert Electrical Technique, or one of the Electrical Trades, your course in this school will be a complete, practical training for a definite kind of position. Under this institution's combined shop, drafting-room and recitation-room curriculum—with our high grade faculty of practical engineers, with our large splendidly-equipped shops and laboratories in which students learn to know electrical apparatus by actual, daily contact—an "S. O. E." Diploma has become a known badge of merit in the electrical industry.

B. S. Degree in 3 Years—Electrical Technician Diploma 1½ to 3 Years—Six Months' and One-Year Electrical Trade Courses.

Recognized "Bachelor of Science" degree given graduates of the Electrical Engineering Department, under laws of Wisconsin, in 3 years. Electrical Technician diploma given in 1½ to 3 years, according to whether student is only Grammar School graduate, or has some High School credits. (Diploma qualifies student for expert technical positions, such as Government Technician, Electro-Mechanical Draftsman, Power Plant Superintendent, Technical Salesman of Electro-Motive Power Installations, etc.) 1-year and 6-months' Trade Courses qualify students as Draftsmen, Linemen, Metermen, Motor Repairmen, Wiremen, Telephone Trouble and Repairmen, Armature Winders.

Two Reserve Officers' Training Corps Units Just Authorized in This School by United States Government.

The War Department has just authorized Junior and Senior R.O.T.C. units in this school. Students joining one of these units will be issued free uniforms and given a free six weeks' summer training camp trip each year. Members of Junior or Signal Corps Unit will receive free instruction in Wireless Telegraphy. **And after a period of 2 years' enrollment, all R.O.T.C. students recommended for same will receive a Government allowance of $12.00 per month.** Requires 3 hours' military training per week. Membership cancelled on leaving school. Mail coupon for full particulars. **New Term every 3 months.**

Earn While You Learn

Mail this coupon for full details of this school's splendid part-time employment plan, which enables students, to earn living expenses while pursuing studies.

Learn Electricity

In the Great Shops of COYNE IN 3½ MONTHS

Thousands of Electrical experts are needed to help rebuild the world. Come to Chicago to the great shops of Coyne and let us train you quickly by our sure, practical way, backed by twenty years of success. Hundreds of our graduates have become experts in less than four months. *You* can do the same. *Now* is your big opportunity. Come—no previous education necessary.

Earn $125 to $300 a Month

In the Electrical business. Come here where you will be trained in these great $100,000 shops. Experts show you everything and you learn right on the actual apparatus. You work on everything from the simple bell to the mighty motors, generators, electric locomotives, dynamos, switchboards, power plants, everything to make you a master electrician. We have thousands of successful graduates. Just as soon as you have finished we assist you to a good position.

Become an Expert in 3½ Months

No need of taking from 1 to 4 years to become an expert, we have proved this in thousands of cases. The Coyne method of practical training eliminates all books, useless theory and other non-essentials and trains you in just what you need to know to become an expert.

Earn Your Way

Don't tell yourself you haven't got the money to come to Coyne. If you have ambition and the nerve of a real man, that's all you need. Dozens of our students every year work in their spare time and earn their living expenses. Dozens of others work in the day time, earn all their expense and attend our evening school. Our employment department will help you without charge.

Day or Evening Courses

Don't worry about the money. Anyone with ambition can learn here. Our tuition is low with small easy payments if desired. All tools and equipment is furnished free. Our students live in comfortable homes in the best section in Chicago—on the lake—just a few minutes' walk from our school.

Electricity, Drafting Motion Picture Operating Plumbing

We teach all these trades and professions quickly and in such a thorough, practical way that when finished you are ready to step right into a position of responsibility and big pay.

Send Today for Big Free Book

Write today, *now*, for the book. It tells what Coyne graduates have done. What you can do. Fill in the coupon, check the trade you are most interested in or send a postal card, do it *now*.

Learn Drafting

The country is crying for skilled draftsmen in all lines. Thousands of positions open with princely salaries. We give you the advantage of our big shops. No other school can do this. Now is the time to get into this big field. Experts train you under practical working conditions, no books and theory go here. Check drafting on the coupon below and mail it *at once* for full particulars.

ELECTRICITY
AS EXPERTS KNOW IT

Learn electricity as you would in actual PRACTICE—in accordance with the methods employed by the highest paid electrical experts in America. The New McGraw-Hill Library of Practical Electricity contains the actual working facts which you need in order to succeed in the electrical field. Terrell Croft, formerly with the Westinghouse Company makes the conquest easy for you.

"See them First — Pay afterwards"

A new standard in electrical literature

The New Library of Practical Electricity by Terrell Croft marks a new era in electrical literature.

The great field of electrical engineering, with its limitless possibilities of earning power, is brought to you in a form that makes success easy. The Library is a creation—an achievement that is without parallel in technical literature, because it sticks to practice throughout its 3000 pages.

$2 per month starts you to bigger pay.

Croft's New Library of Practical Electricity. 8 vols.—3000 pages—2100 illustrations

A letter that means something to you—

McGraw-Hill Book Company, Inc.,
239 West 39th Street,
New York, N. Y.

Gentlemen: In an attempt to express myself about CROFT'S NEW LIBRARY OF PRACTICAL ELECTRICITY, I have never seen and do not believe there was ever printed in the English language, a more comprehensive set of books. It is a library that is just as valuable to the novice as to the expert, because it is all practice.

Respectfully,
GUY H. PEIFER,
Chief, Doplan Silk Corporation, Hazleton, Pa.

Now is the time to prepare for a high salary--- Now is the time to master electricty.

Old books won't do. Amateurish books won't do. Books compiled by "desk authors" or men with no practical experience will not serve your purpose.

Practical books are easiest mastered. Practical books, written by practical men, teach you accurately and rapidly. There is nothing in the Croft Library which you cannot understand. Terrell Croft tells you the secrets of success in electricity in plain words, figures and illustrations. Nothing is left to the imagination. There is no guesswork. There is no theory or higher mathematics.

Send now for these eight volumes. No matter how many books on electricity you possess, you are unfair to yourself unless you take advantage of this free examination privilege. No matter whether you are beginner or expert, these books will show you the clear road to success. Inspection will prove this.

McGraw-Hill Book Co., Inc.
239 W. 39th St., New York.

Not one cent in advance— Just the Coupon

Examine this new Library for ten full days without expense. Find out for yourself why it is now taking the lead in electrical book sales in America. Use the books as you see fit for ten days. Look at the hundreds of illustrations that clear up all the mysteries in electrical practice. Stick a couple of the volumes in your pockets, and refer to them during the day. Figure out in an instant the problems that have heretofore taken hours.

Then send us $2 per month for eight months, or return the set entirely at our expense. You risk nothing by returning the attached coupon.

EDITORIAL

Practical Science

THE wonderful age in which we are living has never been paralleled in history. We have more comforts, more conveniences, more of everything than human beings ever had, since the creation of the world. Nevertheless, our lives become more and more complex, as time rolls on, while the average human being becomes more perplexed at the strange surroundings in which he finds himself.

Our electro-mechanical age brings forth new surprises constantly, and he who does not know the rudimentaries of mechanics, electricity and general physics is like a blind man in a circus. He hears what is going on, but all is meaningless to him—he cannot get the full benefit of the performance.

Where humanity now finds itself surrounded by machines, and by electrical wires at every hand, it behooves every man to know something about them. Thousands of lives are lost every year because laymen refuse to learn a little about science in general. They get killed because they fight short-circuits with water, when ten minutes of study would have told them that water is a conductor, and that a few handfuls of dry sand—which is a non-conductor—would have saved the life, *and* the house which burnt down due to the short-circuit. If the father had told his boy that a wet rope is a good conductor for electricity that boy would be alive today. Instead, the boy threw the wet rope over the high tension line, while holding it in his hand, and was killed.

If the six hundred auto owners who were asphyxiated last year—the casualties become larger each year—had known a bit of chemistry, they, too, would be living today. But they insisted upon running their engines in a garage with closed doors, and unfortunately, you can't smell carbon monoxid, even if it is deadly.

Then, too, hundreds of people perish in snow storms every year quite unnecessarily. Usually they freeze to death. The white man runs about in a frenzy when he knows himself lost. He becomes overheated, and the perspiration soaks his clothing. Finally he sinks down into the snow, exhausted, and if it is cold enough he is soon frozen stiff. Now Eskimos, who have learned a bit of science by hard experience, prefer to live pleasantly thru the worst snowstorm, with the temperature below zero. If the Eskimo becomes lost in the wilderness he knows better than to run about aimlessly. He promptly digs a cave into the snow, with the entrance away from the wind, using only his hands for tools. Inside of ten minutes he is safely ensconced in a comparatively warm shelter. He then closes up the entrance almost entirely, sits down, drops his head on his knees, and has a refreshing sleep. The next morning he digs himself out, and is on his way.

If the writer had not known something about electricity, he, too, might not be here to write these lines. As a boy he went down into an unoccupied cellar. The wind blew the wooden door shut, locking him in, as the iron latch was outside. The only other exit was an open window hole barricaded with stout iron rods, thru which the wind roared. The temperature was below zero. The cellar was empty, save for a few wooden crates, the object of the visit. The cellar being distant from the house and other habitations, the parents away, and the caretaker off for the night, there was every possibility of his freezing to death. No tools to break down the door, no matches to make a fire. But there was a portable light, with two large electric dry cells in a wooden box, which the writer had brought along to light his way.

He unraveled the stranded electric cord and extracted a single thin copper strand an inch long. With this he short-circuited the dry cells. The wire became white hot. A piece of paper was touched to it, which burst into flame; a broken piece of crate wood was ignited by the flame, and a fire soon roared. A burning crate set the cellar door on fire, and in ten minutes the adventure had come to a close.

H. GERNSBACK.

The ELECTRICAL EXPERIMENTER is publisht on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. Subscription price is $2.00 a year in U. S. and possessions, Canada and foreign countries, $2.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 20 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. A green wrapper indicates expiration. No copies sent after expiration.

All communications and contributions to this journal should be address to: Editor, ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full postage has been included. ALL accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.

ELECTRICAL EXPERIMENTER. Monthly. Entered as second-class matter at the New York Post Office under Act of Congress of March 3, 1879. Title registered U. S. Patent Office. Copyright, 1919, by E. P. Co., Inc., New York. The Contents of this magazine are copyrighted and must not be reproduced without giving full credit to the publication.

The ELECTRICAL EXPERIMENTER is for sale at all newsstands in the United States and Canada; also at Brentano's, 37 Avenue de l'Opera, Paris.

The Secret of Being a Convincing Talker

How I Learned It in One Evening

By GEORGE RAYMOND

"HAVE you heard the news about Frank Jordan?"

This question quickly brought me to the little group which had gathered in the center of the office. Jordan and I had started with the Great Eastern Machinery Co., within a month of each other, four years ago. A year ago Jordan was taken into the accounting division and I was sent out as salesman. Neither of us was blessed with an unusual amount of brilliancy, but we got by in our new jobs well enough to hold them.

Imagine my amazement, then, when I heard:

"Jordan's just been made Treasurer of the Company!"

I could hardly believe my ears. But there was the "Notice to Employees" on the bulletin board, telling about Jordan's good fortune.

Now I knew that Jordan was a capable fellow, quiet, and unassuming, but I never would have picked him for any such sudden rise. I knew, too, that the Treasurer of the Great Eastern had to be a big man, and I wondered how in the world Jordan landed the place.

The first chance I got, I walked into Jordan's new office and after congratulating him warmly, I asked him to let me "in" on the details of how he jumped ahead so quickly. His story is so intensely interesting that I am going to repeat it as closely as I remember.

FREDERICK HOUK LAW

As educator, lecturer, executive, traveler and author few men are so well equipped by experience and training as Dr. Law to teach the art of effective speaking. His "Mastery of Speech" is the fruit of 20 years' active lecturing and instruction in Eastern schools and colleges preceded by an education at Oxford Academy, Amherst College, Columbia University, The Teachers College, Brown University, and New York University. He holds the degrees of A.B., A.M., and Ph.D.

Dr. Law is the author of two novels, two books of poetry, and editor of six school text-books. At present he is lecturer in English in New York University, Lecturer in Pedagogy in the Extension Work of the College of the City of New York, Head of the Dept. of English in the Stuyvesant H. S. and writer of the Weekly Lesson Plans for The Independent.

"I'll tell you just how it happened, George, because you may pick up a pointer or two that will help *you*.

"You remember how scared I used to be whenever I had to talk to the chief? You remember how you used to tell me that every time I opened my mouth I put my foot into it, meaning of course that every time I spoke I got into trouble? You remember when Ralph Sinton left to take charge of the Western office and I was asked to present him with the loving cup the boys gave him, how flustered I was and how I couldn't say a word because there were people around? You remember how confused I used to be every time I met new people? I couldn't say what I wanted to say when I wanted to say it; and I determined that if there was any possible chance to learn how to talk I was going to do it.

"The first thing I did was to buy a number of books on public speaking, but they seemed to be meant for those who wanted to become orators, whereas what I wanted to learn was not only how to speak in public but how to speak to individuals under various conditions in business and social life.

"A few weeks later, just as I was about to give up hope of ever learning how to talk interestingly, I read an announcement stating that Dr. Frederick Houk Law of New York University had just completed a new course in business talking and public speaking entitled 'Mastery of Speech.' The course was offered on approval without money in advance, so since I had nothing whatever to lose by examining the lessons, I sent for them and in a few days they arrived. I glanced through the entire eight lessons, reading the headings and a few paragraphs here and there, and in about an hour the whole secret of effective speaking was opened to me.

"For example, I learned why I had always lacked confidence, why talking had always seemed something to be dreaded whereas it is really the simplest thing in the world to 'get up and talk.' I learned how to secure complete attention to what I was saying and how to make everything I said interesting, forceful and convincing. I learned the art of listening, the value of silence, and the power of brevity. Instead of being funny at the wrong time, I learned how and when to use humor with telling effect.

"But perhaps the most wonderful thing about the lessons were the actual examples of what things to say and when to say them to meet every condition. I found that there was a knack in making oral reports to my superiors. I found that there was a right way and a wrong way to present complaints, to give estimates, and to issue orders.

"I picked up some wonderful pointers about how to give my opinions, about how to answer complaints, about how to ask the bank for a loan, about how to ask for extensions. Another thing that struck me forcibly was that, instead of antagonizing people when I didn't agree with them, I learned how to bring them around to my way of thinking in the most pleasant sort of way. Then, of course, along with those lessons there were chapters on speaking before large audiences, how to find material for talking and speaking, how to talk to friends, how to talk to servants, and how to talk to children.

"Why, I got the secret the very first evening and it was only a short time before I was able to apply all of the principles and found that my words were beginning to have an almost magical effect upon everybody to whom I spoke. It seemed that I got things done instantly, where formerly, as you know, what I said 'went in one ear and out the other.' I began to acquire an executive ability that surprised me. I smoothed out difficulties like a true diplomat. In my talks with the chief I spoke clearly, simply, convincingly. Then came my first promotion since I entered the accounting department. I was given the job of answering complaints, and I made good. From that I was given the job of making collections. When Mr. Buckley joined the Officers' Training Camp, I was made Treasurer. Between you and me, George, my salary is now $7,500 a year, and I expect it will be more from the first of the year.

"And I want to tell you sincerely, that I attribute my success solely to the fact that I learned how to talk to people."

****

When Jordan finished, I asked him for the address of the publishers of Dr. Law's Course and he gave it to me. I sent for it and found it to be exactly as he had stated. After studying the eight simple lessons I began to sell to people who had previously refused to listen to me at all. After four months of record breaking sales during the dullest season of the year, I received a wire from the chief asking me to return to the home office. We had quite a long talk in which I explained how I was able to break sales records—and I was appointed Sales Manager at almost twice my former salary. I know that there was nothing in me that had changed except that I had acquired the ability to talk where formerly I simply used "words without reason." I can never thank Jordan enough for telling me about Dr. Law's Course in Business Talking and Public Speaking. Jordan and I are both spending all our spare time making public speeches on war subjects, and Jordan is being talked about now as Mayor of our little town.

So confident is the Independent Corporation, publishers of "Mastery of Speech," Dr. Law's Course in Business Talking and Public Speaking, that once you have an opportunity to see in your own home how you can, in one hour, learn the secret of speaking and how you can apply the principles of effective speech under all conditions, that they are willing to send you the Course on free examination.

Don't send any money. Merely mail the coupon or write a letter and the complete Course will be sent, all charges prepaid, at once. If you are not entirely satisfied send it back any time within five days after you receive it and you will owe nothing.

On the other hand, if you are as pleased as are the thousands of other men and women who have used the Course, send only $5 in full payment. You take no risk and you have everything to gain, so mail the coupon now before this remarkable offer is withdrawn.

The Burgess BLUE BOOK

for all Practical Men and Electrical Students

(See review of this book by Editor in December issue of your Electrical Experimenter page 568)

I have prepared a pocket-size note book especially for the practical man and those who are taking up the study of electricity. It contains drawings and diagrams of electrical machinery and connections, over two hundred formulas for calculations, and problems worked out showing how the formulas are used. This data is taken from my personal note book, which was made while on different kinds of work, and I am sure it will be found of value to anyone engaged in the electrical business.

The drawings of connections for electrical apparatus include Motor Starters and Starting Boxes, Overload and Underload Release Boxes, Reversible Types, Elevator Controllers, Tank Controllers, Starters for Printing Press Motors, Automatic Controllers, Variable Field Type, Controllers for Mine Locomotives, Street Car Controllers, Connections for Reversing Switches, Motor and Dynamo Rules and Rules for Speed Regulation. Also, Connections for Induction Motors and Starters, Delta and Star Connections and Connections for Auto Transformers, and Transformers for Lighting and Power Purposes. The drawings also show all kinds of lighting circuits, including special controls where Three and Four Way Switches are used.

The work on Calculations consists of Simple Electrical Mathematics, Electrical Units, Electrical Connections, Calculating Unknown Resistances, Calculation of Current in Branches of Parallel Circuits, How to Figure Weight of Wire, Wire Gauge Rules, Ohm's Law, Watt's Law, Information regarding Wire used for Electrical Purposes, Wire Calculations, Wiring Calculations, Illumination Calculations, Shunt Instruments and How to Calculate Resistance of Shunts, Power Calculations, Efficiency Calculations, Measuring Unknown Resistances, Dynamo and Dynamo Troubles, Motors and Motor Troubles, and Calculating Size of Pulleys.

Also Alternating Current Calculations in finding Impedance, Reactance, Inductance, Frequency, Alternations, Speed of Alternators and Motors, Number of Poles in Alternators or Motors, Conductance, Susceptance, Admittance, Angle of Lag and Power Factor, and formulas for use with Line Transformers.

WHAT PRACTICAL MEN SAY ABOUT THE "BURGESS BLUE BOOK"

Received your "Blue Book" and must say it is the best book I ever saw. I showed it to a friend of mine and he refused to give it back to me but he paid me a dollar and told me to get another. Rather than be without this book I am sending Money Order for three of them so I can show them to two more of my friends and have one left for myself. Wishing you would mail them at once, I am Yours very truly,

JOSEPH BRAITH, Electrician,
Madison, Wisconsin.

Your "Blue Book" received and it is just the book I have been looking for. Please mail me three more by return mail for which I am enclosing Money Order. Respectfully,

V. E. JOHNSON, Western Union Tel. Co.,
Marion, Ohio.

Have received the copy of the "Burgess Blue Book" and am very well pleased with the easily found formulas and data contained in it. I am enclosing Money Order for four additional copies. Very truly yours,

THURE C. ANDERSON,
Ridgeway, Penn.

Dear Sir:—There can be no possible question as to the service you are rendering Electrical Workers. To date I have received 78 Burgess Blue Books and hope my friends will duplicate their order to you. Go ahead with this good work,
Yours truly,

EDW. C. RAY,
Brooklyn, New York.

I am enclosing three dollars for which please send me three copies of the "Burgess Blue Book". I showed the copy I got last week to some friends and three of them asked me to get them one. Very truly yours,

CHAS. H. DAVIS,
Los Angeles, Cal.

I received your "Blue Book" and after I looked over it I see that it is a very useful book. After I showed it to some fellows they wanted a copy also and I am enclosing Money Order for which please send me three at once. Yours very truly,

R. S. SWANSON,
St. Paul, Minn.

I received the three books I sent for and the next day I sold them. The fellows think they are well worth the price. Please send me three more for which I am enclosing Money Order. Yours very truly,

R. S. SWANSON,
St. Paul, Minn.

NOTICE

To help get the "Burgess Blue Book" to the men who need it the most, we have established a resale discount to which those who have purchased a book from us are entitled. In this way the "Blue Book" is sold by those who know its value and we feel that this arrangement is much more satisfactory to the purchaser, than if he bought it through the regular book-selling channels. The book practically sells on sight, as a man engaged in practical work realizes when he sees it, it contains information which is extremely useful and which is difficult to obtain.

The Burgess BLUE BOOK Will Be Shipped, Postpaid, on Receipt of *$1.00*

Send dollar bill, money order or check. *I guarantee satisfaction or will return your money* if you decide not to keep the book after using it for five days

BURGESS ENGINEERING CO., YORKE BURGESS, *Consulting Engineer*
747 East 42nd Street Chicago, Illinois

Was $100

Now $57

The Famous Oliver

For Free Trial—Then Save $43

This is the identical $100 Oliver, Model 9, our latest and best. We continue to sell it under the plan we adopted during the war.

We learned economies then in selling which enable us to save the $43 it formerly cost us to sell you an Oliver.

We learned that it was unnecessary to have great numbers of traveling salesmen and numerous, expensive branch houses throughout the country. We were also able to discontinue many other superfluous, costly sales methods. You benefit by these savings.

Only our sales plan has changed. Not the Oliver. Our new plan is to ship direct from the factory to you, depending upon the Oliver to be its own salesman.

You may order direct from this advertisement, without sending a penny. The coupon brings an Oliver for free trial.

When the Oliver comes to you, let it prove its superiority and saving. You be the judge, with no eager salesman present to influence you.

If you do not agree that it is the finest typewriter built, regardless of price, simply return it, express collect. Even the outgoing transportation charges will then be refunded.

The Oliver for $57 makes a $100 price appear extravagant. Remember this is not a second-hand or rebuilt machine. If any typewriter is worth $100, it is this brand new Oliver.

Furthermore, it is as easy to buy The Oliver as it is to try it. If, after trying it five days you decide to keep it, you merely pay $3 per month until the $57 is paid. This is less than 10c per day.

This Oliver is being bought by the thousands. Our plan, conceived when this country entered the war, has met a tremendous welcome. We have repeatedly increased our production facilities. Note at the left a few of the great concerns using the Oliver. And remember that it is being bought by thousands of individuals. It has been aptly called the people's typewriter.

In every particular, this splendid Oliver is the finest that 24 years of experience can produce. A better typewriter is impossible. It has all the latest improvements. It is noted for its handsome appearance, richly enameled olive green and polished nickel; its durability and workmanship. Do you know of any typewriter which combines so many advantages, yet offered at such a low price and easy terms?

This Oliver has a standard keyboard. So anyone may turn to it without the slightest hesitancy. It is speedy and has an untiring action—with lightest touch.

Don't buy—don't rent—until you have investigated this fine economical Oliver. Note that the coupon below brings either an Oliver for Free Trial, or further information.

Master Electricity By Actual Practice

The only way you can become an expert is by doing the very work under competent instructors, which you will be called upon to do later on. In other words, *learn by doing.* That is the method of the New York Electrical School.

Five minutes of actual practice properly directed is worth more to a man than years and years of book study. Indeed, Actual Practice is the only training of value, and graduates of New York Electrical School have proved themselves to be the only men that are fully qualified to satisfy EVERY demand of the Electrical Profession.

The Only Institution of the Kind in America

At this "Learn by Doing" School a man acquires the art of Electrical Drafting; the best business method and experience in Electrical Contracting, together with the skill to install, operate and maintain all systems for producing, transmitting and using electricity. A school for Old and Young. Individual instruction.

Over 5,500 Graduates are Successful Men in the Electrical World

No previous knowledge of electricity, mechanics or mathematics is necessary to take this electrical course. You can begin the course now and by steady application prepare yourself in a short time. You will be taught by practical electrical experts with actual apparatus, under actual conditions.

Let us explain this course to you in person. If you can't call, send now for 64-page book—it's FREE to you

Vol. VII. Whole No. 73 MAY, 1919 No. 1

Future Rapid Transit

PEOPLE who have traveled abroad will remember having seen the remarkable suspended aërial railway of Elberfeld (Germany), the cars having wheels on the roof instead of underneath, and but one rail being used. This form of construction gives, among other considerations, much greater flexibility to the speeding cars or trains, as for example when they wish to turn sharp curves at comparatively high speed. Possibly many will remember having seen this interesting suspended railway in the motion picture travelogues given by Burton Holmes. It has always seemed to us, however, that these cars have a little too much freedom of movement to make the ride as comfortable as it might be to the passengers, owing to the constant swinging or sidewise rolling motion produced by this cradle suspension arrangement. Apparently there are other people who have entertained similar ideas, for in the accompanying illustration there is shown a new development of a monorail car, which might be termed an "Aërial Monoflier," and which has been recently invented and patented by the celebrated French engineer, M. Francis Laur of Paris. As M. Laur points out in his description of the invention, his scheme relates to an improvement in a vehicle for use in high speed locomotion in connection with a monorail or single track. A very novel idea of the project is a passenger-carrying vehicle somewhat in the form of

(*Continued on page* 66)

Copyright, 1919, by E. P. Co.

The Aërial Monoflier of Tomorrow—Equipt with Wings, Like an Airplane, It Will Skim Along Thru the Air, Guided by the Monorail. The Cars Are Propelled by Motor-Driven Propellers, Which Derive Their Power from Third Rails, as the Car Glides Along at Speeds of 200 to 300 Miles Per Hour. When In Motion the Entire Weight Is Practically Carried by the Wings, the Same as In an Airplane.

Will Man Freeze the Earth to Death?

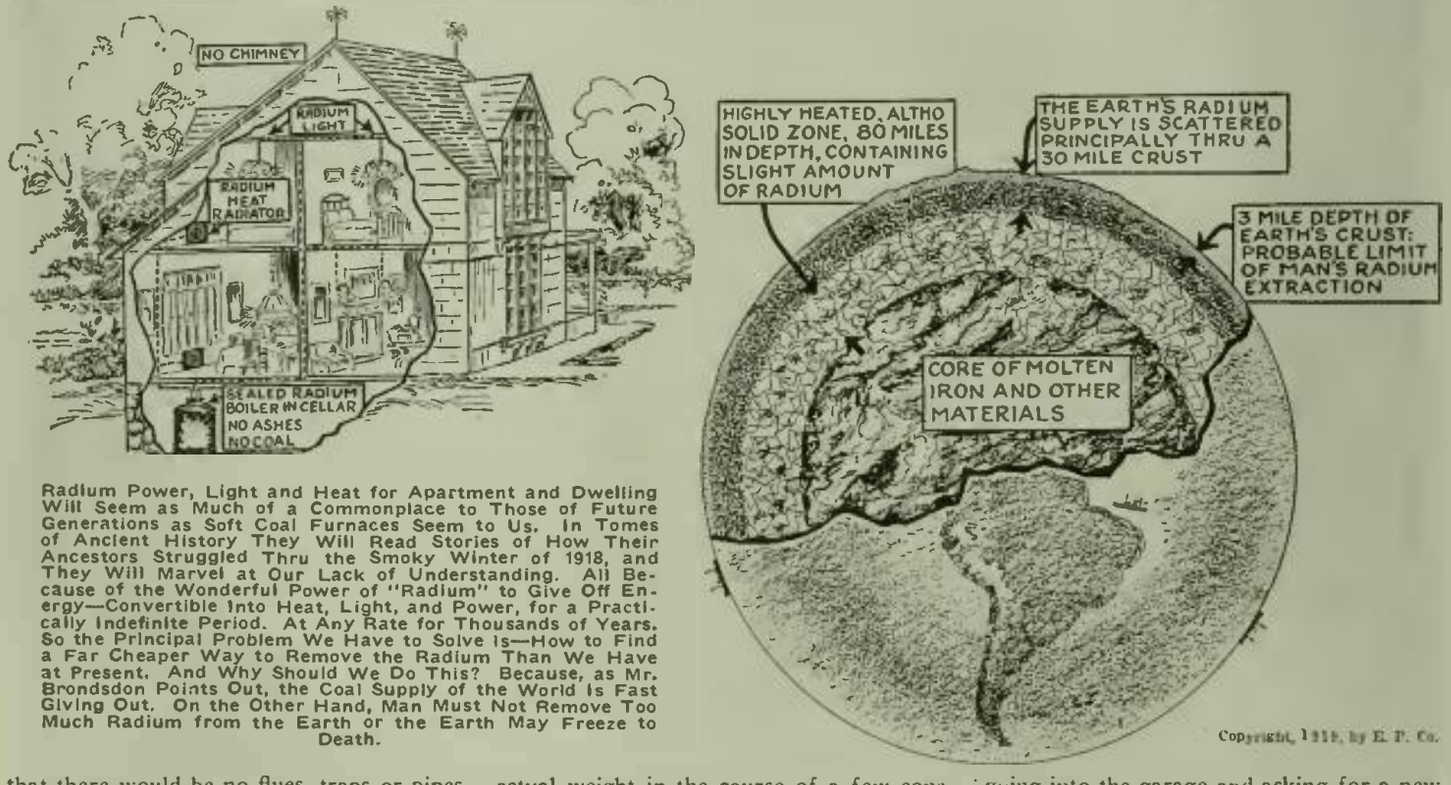
By E. T. BRONDSDON

"TO RENT: Ten-room suburban home. Three baths. Sun, sleeping and breakfast porches. Radium heating system (20 pounds) . . ." To find this advertisement, look in the classified columns of any metropolitan newspaper five or six centuries hence. Our great-great-grandchildren fifteen times removed will be worrying about paying the rent on some such dwelling. Have you paid your "Radium Rent" will be a common slogan then.

Radium power, light and heat for apartment and home will seem as much of a commonplace to them as soft coal furnaces seem to us. In tomes of ancient history they will read stories of how their ancestors struggled thru the smoky winter of 1918, and they will marvel at our lack of understanding. Soft coal then will have a place only in museums.

Twenty pounds of radium gives off an amount of heat in six months equivalent to that secured by burning four and one-half tons of the best Pocahontas or anthracite coal. The ten-room house mentioned above would be adequately heated, however, on twenty pounds, because a radium heating plant would be *one hundred per cent efficient*. Even with hot water and hard coal from eighty to ninety per cent of the heat our plants generate goes up the chimney. A radium system would have no chimney. Every single heat unit would be conserved for the interior of the house and distributed by any ordinary medium, such as register, radiator or the like.

In addition to this, the radium system would have the splendid recommendation that there would be no flues, traps or pipes to be cleaned, and no ashes would accumulate to make the householder angry on Saturday afternoon. Then there would be the greatest point of all. Once installed, this radium system *never would have to be replaced!* When one house began to disintegrate from old age, the mysterious metal could be taken out and installed in the system of a new house, and so on forever, unless some careless janitor took it out to clean and left it in the subway Coal men and ash carters would pass into that same merciful oblivion which shelters stage-coach bandits and Indians on the warpath.



The reason why such a radium system would never have to be replaced is that radium is the one and only close approach to perpetual motion to be found on our globe. Look at a piece of radium one-thousandth the size of a pin point thru a *spinthariscope*. This is an instrument consisting of a high-magnifying lens and an aluminum disc covered with zinc sulfid. When viewed in this manner millions of tiny arrows of fire are seen to be flying from the radium and impinging on the zinc sulfid with an explosion like that of a fire ball from a Roman candle.

Tho each of the exploding projectiles of helium—radium somehow transforms itself into active atoms of this other element—looks nearly as large as the original divot of radium, you may glue your eye to the spinthariscope for hours—centuries, if you live that long—and you never will see any diminution in the discharge or in the size of the radium piece.* Scientists who have given the matter intensive study over long months and years say that they suspect radium of losing an infinitesimal part of its actual weight in the course of a few eons, but that human beings are going to have trouble gathering accurate data on the subject unless a dynasty of scientific Methuselahs is established.

The one big obvious objection at present to the use of radium for heating plants lies in the scarcity and tremendous cost of the metal. One ounce only would cost, at the present market price, approximately $40,000. The twenty pounds necessary for heating the ten-room house mentioned would retail at $12,800,000, were such a quantity procurable. Figuring interest at six per cent, the cost of that radium heating system for a year—excluding the original investment, which would not appreciably deteriorate—would be in the neighborhood of $768,000, or about 4,000 times the cost of coal heating today.

The only logical reason in the world for even allowing imagination to roam on this subject lies in the terrible and undisputed fact that *somewhere we are going to have to get heat if we are to live!*

So much space has been given in the last decade to learned dissertations on our rapidly decreasing supplies of coal and petroleum that it is useless to dwell on this. Suffice it to say that the last reports of competent authorities state baldly that we will surely be out of both *forever* at the conclusion of the present century, provided our present rate of consumption is neither raised or lowered. Since we have no assurance that the rate of increase of consumption will not keep on, we may bet safely that the year 1975 will see coal and oil so scarce that only millionaires can afford them. Coal then may be $500 a ton, and crude oil $25 a gallon. Alas for the "flivvers"! Imagine Mr. Autoist of that day going into the garage and asking for a new "can" of Radium for his "Radiobile." It can happen. (*Continued on page* 59)

Radium Power, Light and Heat for Apartment and Dwelling Will Seem as Much of a Commonplace to Those of Future Generations as Soft Coal Furnaces Seem to Us. In Tomes of Ancient History They Will Read Stories of How Their Ancestors Struggled Thru the Smoky Winter of 1918, and They Will Marvel at Our Lack of Understanding. All Because of the Wonderful Power of "Radium" to Give Off Energy—Convertible Into Heat, Light, and Power, for a Practically Indefinite Period. At Any Rate for Thousands of Years. So the Principal Problem We Have to Solve Is—How to Find a Far Cheaper Way to Remove the Radium Than We Have at Present. And Why Should We Do This? Because, as Mr. Brondsdon Points Out, the Coal Supply of the World Is Fast Giving Out. On the Other Hand, Man Must Not Remove Too Much Radium from the Earth or the Earth May Freeze to Death.

Copyright, 1919, by E. P. Co.

*This is not strictly the case, for the zinc sulfid spinthariscope we have to-day, for while the radium will last for thousands of years, the zinc sulfid will give out in a relatively short time. However, there are undoubtedly other substances which would last much longer than zinc sulfid. Another variable factor, variable in the sense that we have not lived long enough with radium yet to tell exactly how long it will last before losing its power, is the total life of this marvelous substance. Scientists tell us that in 1,800 years radium loses one-half of its activity. In another 1,800 years one-half of the remainder will have disintegrated, etc., etc. So that on this assumption the radium will have totally disintegrated in 22,000 years.—Editor.

How the French Located Submarines

ONE by one the multitudinous scientific secrets of the great World War are finding their way to the public press, so that the student of science may at last have his appetite appeased in his quest of descriptive matter on some of the master problems which have been worked out and solved by engineers and scientific workers connected with army and navy developments. Probably no one problem in the whole war drew more attention from laymen and scientists alike than did the one of accurately discovering and locating the whereabouts of the Kaiser's U-Boats. The United States Naval Advisory Board received thousands upon thousands of suggestions, all telling how very simple it was to ferret out and locate the position of an enemy submarine, just by placing a microphone or set of microphones in the hull of a vessel and connecting these up with a set of telephone receivers, so that the sound produced by the submarine propeller and motor would be picked up by the microphones and thus heard in the receivers. Various methods were described for taking certain definite and very precise measurements along these lines, so as to work out mathematically or otherwise the position of the lurking sub-sea fighter. Considerable success was obtained with similar arrangements by the navies of the different countries participating in the World War, but the Walser gear—a special type of hydrophone used particularly for listening to submarines under water was developed and successfully used by the French Navy and other allied vessels for accurately locating enemy submarines at distances of one mile to three miles or more, depending upon the operating conditions and the size of the submarine.

The Walser Gear, whose construction has been kept secret during the war, is a directional apparatus for detecting and recording sounds heard thru water and thus locating the presence or approach of enemy ships. Many different devices for "listening" for enemy ships have been disclosed, but this apparatus, the invention of Lieut. Georges Walser, of the French Navy, is recognized as the most improved type and most practicable.

The sounds are received thru a number of vibrating diaframs fitted into holes pierced in a boss, or "blister" of sheet steel, which replaces a corresponding section of a ship's hull. The observer works in a sound-proof cabin stretching across the whole width of the ship, and wears a listening helmet attached to two trumpets. Into these trumpets the sounds are focust by the vibrating diaframs attached to the the "blister."

Diagram of One "Lens" of the Walser Submarine Detector and Locater, Showing the Carefully Worked Out Balancing Scheme for Supporting the Movable Sound Trumpet Over the Various Sound Focal Points.

Some of the disadvantages of the ordinary listening microphone arrangement for the detection of submarines are the following: Invariably the vessel on which they are mounted has to be stopt momentarily while a listening test is being made, in order that the ship's engines shall not drown out the sounds which the listening operator is endeavoring to pick up from the sea. It is interesting to mention in this connection, that some of the American listening devices of this type were so remarkably sensitive that even a small dynamotor used on the regular wireless apparatus on the vessel had to be mounted on springs, so that the extremely slight mechanical vibration set up by it would not interfere with the sounds picked up from the water on the submerged microphones fastened to the hull of the boat. Another fault found with the ordinary "hydrophone" is that the different sounds received simultaneously could not be distinguished very readily from one another, and even if but one sound was picked up, the direction from which the sound emanated was not very perfectly indicated.

Practically speaking then, one of the

The Accompanying Sectional View Shows Vividly How the New Vehicular Tunnel Under the Hudson River at New York City Will Look When Finished. There Seems to be No Question at Present as to the Possibility of Building This Tunnel, and the Only Remaining Details Are Engineering Considerations Such as Ventilation, Etc., Which Are Being Rapidly Solved by Some of the Crack Engineers of America, Including No Less a Personage Than General George W. Goethals, Builder of the Panama Canal, and Now Holding the Position of Consulting Engineer to the Interstate Bridge and Tunnel Commissions of New York and of New Jersey. Several Other Proposals Have Been Brought Forward for the Building of This Tunnel Under the Hudson River, But the Goethals Plan Seems to be the Most Feasible, and the One Most Likely to be Adopted. The Length of This Vehicular Tunnel Will be About 9,400 Feet from Portal to Portal, with a Distance of 5,500 Feet, or More Than a Mile Separating the Bulkhead Lines, If These Are Placed Back of the Shore Line. In View of the Fact that the Ventilation Problem Is at Present One of the Most Important, and the One Responsible for the Most Discussion Among Tunnel Experts, We Have Several Suggestions In the Present Article and Illustrations Which Might, If Adopted, Help to Bring About the Early Adoption

Hudson River

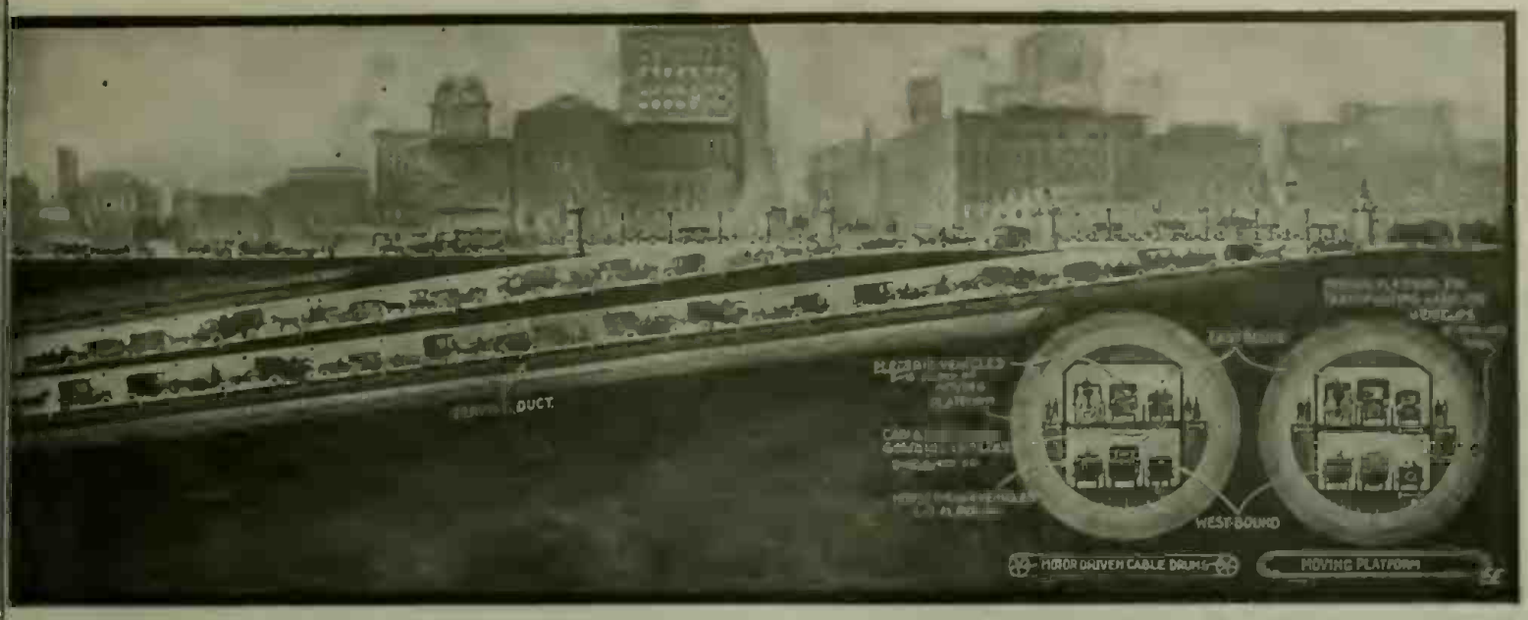
By H. WINFIELD
Associate Member American

THE bridging of the Hudson River, commonly known as the North River in New York City, is an engineering problem that has been before the people of the states of New York and New Jersey for probably more than thirty years. A bridge across this great water highway would no doubt have been constructed many years ago, if it had been found possible to raise sufficient funds to render this dream a living reality. Engineering experts have recently bestirred themselves with the thought of crossing the Hudson either by bridge or else by means of a tunnel, particularly a vehicular tunnel suitable for horse-drawn, electric and gasoline propelled vehicles. The bridge question seems to have been discarded practically altogether now, owing to its tremendous initial cost, which would be about $72,000,000 at least, compared to the initial cost of $12,000,000 for constructing a large tunnel under the Hudson on the newly revised plan proposed by General George W. Goethals, the well-known American engineer and builder of the Panama Canal. General Goethals has been appointed consulting engineer to the Interstate Bridge and Tunnel Commissions of New York and of New Jersey. There are many reasons why New York should have means of communication such as this, as its sister state supplies, either directly or indirectly, a very large portion of the food and other commodities for greater New York's population of 7,000,000, which is brought to the piers on the west side of the Hudson by numerous railroads. Right here there is a constant and prohibitive wastage of perishable food products, owing to the highly congested and inadequate terminal facilities afforded for their movement.

At the present time there is more or less agitation in the legislatures of both states between those friendly and unfriendly to the Hudson River project. So far the one great problem, according to some of the testimony being given, and which has seemed almost insurmountable, is the proper ventilation of this tube, especially where gasoline driven vehicles are to be permitted to exhaust devitiating gases into the air of the tunnel. But according to a very able engineering report on this project, given in the Journal of the Franklin Institute and prepared by Martin Schreiber, Chief Engineer of the Public Service Railway Company of New Jersey, the ventilating problem of such a tunnel as proposed by General Goethals and other engineers can be readily taken care of, as actual laboratory tests have proven, and which have provided a satisfactory basis for calculating the results of such a long tunnel as that under the Hudson. Also to back up the argument for building the tunnel, there is precedence afforded by the fact that London, England, has built two vehicular tunnels under the Thames River, one 6,200 feet long, and the other 6,883 feet long.

The editors make several new tunnel suggestions, which are shown in the illustration accompanying this article, whereby the gigantic ventilating problem could be overcome to a large extent by controlling the kinds of traffic that should be allowed to pass thru the tube. First, the writer would suggest that the engineers contemplating the building of this tunnel consider a cable-way, one of which would be provided on each roadway, east and west, for the purpose of hauling *gasoline operated* vehicles thru the tunnel, *without their engines being operated*, thus doing away with the production of the objectionable carbon monoxid and other poisonous gases emanating from their exhaust. It would not be an impossible, or even impracticable matter, if such an electric motor-operated cable-way, similar to the old cable-car systems, were used to haul the gasoline vehicles thru the tunnel to Jersey or to New York. It could be arranged to have the owners purchase a standard cable grip, which could be fitted on to any gasoline vehicle at nominal cost.

Another proposal, made by Mr. H. Gernsback, is one employing a *moving roadway* of sufficient width to accommodate gasoline auto trucks, the roadway being operated by electric motors spaced at suitable intervals along its length.



Another proposal suggested by the writer would be to utilize a trolley wire over the one line of traffic apportioned to gasoline vehicles on each roadway, and having the owners of these vehicles equip them with a trolley pole, but by the time the owners had installed an electric motor under the gasoline vehicles for use with it, it would probably be just as well for the tunnel operating engineers to ask the owners of such vehicles to invest in electric trucks for that particular traffic intended to go via the tunnel.

All of the tunnel proposals now under consideration agree on the location, which extends from Twelfth Street, Jersey City, to Canal Street, New York. The termini of the tunnel at both ends are located in the center of the trucking and freight districts. The New Jersey terminus is also happily located adjacent to the great freight yards of the principal railroads, and close to the main ferry lines, thus providing every chance for close co-operation. Besides, the great Lincoln and other much used vehicular highways lead to the location proposed for the Jersey City terminus.

The Hudson tubes as well as the Pennsylvania tunnels under the Hudson River, which are used for railway traffic exclusively, were driven by the well-known shield method. General Goethals, in his proposal for the new Hudson vehicular tunnel, has advocated the shield-driven double-deck single tube, as shown in the accompanying illustration. This tube is to have an internal diameter of 36 feet, with two 18-foot roadways, one super-imposed above the other, and a concrete floor between them. This proposal for the tunnel would permit of four lines of vehicles, two on each roadway, two of the faster moving type such as pleasure automobiles on the upper floor, and two of the slower moving vehicles, such as auto-trucks, on the lower floor.

Most of these under-river tubes have been constructed with cast-iron blocks built of segmental form, which were bolted together after being put in place, and which thus tended to resist any external hydrostatic

www.americanradiohistory.com

of the Tunnel Project. Among These Features Are the Following:—First, That a Ventilator Shaft be Placed a Comparatively Short Ways Out in the River at Either Approach, So as to Simplify the Ventilating Problem by Reducing the Length Between the Bulkheads. Second, That Gasoline Vehicles be "Hauled" Thru the Tunnels So as to Eliminate the Fouling of the Air by Obnoxious Exhaust Gases, Particularly Carbon Monoxid, by Means of a Moving Platform. Third, Haul Gasoline Vehicles Thru the Tunnel by a Cableway Similar to the Well-Known Cable Car System. Fourth, Cause the Gasoline Vehicles to be Fitted with a Trolley Pole and Electric Motor for the Purpose of passing Thru the Tunnel Without Discharging Obnoxious Gases. The Goethals Proposal Calls for a Concrete Block Tunnel, 42 Feet In Outside Diameter, with Two Road Levels, as Here Shown. One Roadway Will be for East-Bound Traffic, and the Other for West-Bound Traffic. Actual Laboratory Tests On a Short Length of Tunnel Have Shown That 750 H.P. Would be Required to Operate the Fresh Air and Exhaust Fans, with a Maximum Capacity of 360,000 Cubic Feet of Fresh Air Per Minute.

Vehicular Tunnel

SECOR

Institute Electrical Engineers

pressure with great power, much in the same way that the stones of an archway tend to support the arch. The outside of these segmental steel tubes is covered over with a fairly thick coating of concrete. Here is where the Goethals proposal differs radically from former practise, and there is considerable discussion now taking place as to the feasibility and practicability of his proposed design, which is as follows:

General Goethals' proposition is that the tunnel be constructed of O'Rourke concrete blocks in segmental form. Outside of this tube a gravel packing is to be placed. Some experts seem to doubt whether such a tube would be thoroly water-proof, and also what would happen in case of an earthquake or other severe concussion, as when a powder boat or supply of explosives might happen to blow up in the harbor, as has occurred several times during the war, when the concrete tube might crack with an appalling loss of life.

Detailed plans have been drawn up by the New York State Bridge and Tunnel Commission, under the direction of Major General George W. Goethals and John F. O'Rourke, which provide for the driving of the tunnel by the use of a shield forty-two feet in diameter—the method most usual when dealing with soft material. The material under the Hudson River is a soft silt and sand overlaid by still softer material of sewage origin, which is almost fluid. These conditions are complicated by the presence of ledge rock which is occasionally encountered. In a shield having a diameter of twenty-five feet, there is a difference in pressure between the top and bottom of ten pounds per square foot. This makes it difficult to guard against blow-outs and other accidents caused by the difference in pressure at the top and bottom of the shield, tunnel experts consulted by the state commissions have pointed out.

The diameter of the shield used in driving the Hudson tunnel was 17 feet; that of the Pennsylvania tunnel shields 23 feet 6 inches. The latter were the largest ever used under either the Hudson or the East rivers. The Rotherhithe tunnel, under the Thames River in England, was driven with a shield 30 feet in diameter thru clay mixt with shells, pebbles, loam, a much firmer material than that under the Hudson.

Of course, the traffic would have to be handled so that approximately half of the vehicles would move *eastward* and the other half *westward*. Once the tunnel is built, however, this becomes a problem for the traffic engineers of that year to solve. According to the Goethals plan, the fresh air duct is at the top of the tunnel, and fresh air is constantly pumped along this duct by means of powerful electrically-driven blowers and fans, while the foul air, including exhaust from the gasoline vehicles, is drawn out thru ducts at the bottom of the roadway. Besides, there are additional ventilating and foul air ducts at either side of the tunnel, walled off from the roadways.

To find out exactly what would happen in a section of such a tunnel with a number of gasoline vehicles operating their engines therein, a test building, corresponding in cross-section to the proposed tunnels and measuring 125 feet in length, was constructed at Newark, N. J. Eight automobiles were operated in this building, which could be shut off air-tight and fresh air pumped in at the top and the exhaust pumped out at the bottom, or vice versa. A number of elaborate tests of various kinds were carefully made by experts, including Professor Gellert Alleman, of Swarthmore, Pa., and Dr. H. Jermain Creighton, of Swarthmore College. From a very elaborate and convincing analysis on the various gases present in the tube after the automobiles had been operated for a period of forty minutes, Prof. Alleman reported that when all doors were closed and the ventilators opened, after the engines of eight cars had been *running light* for forty minutes, the condition of the atmosphere was almost normal, so far as physiological action was concerned, and the amount of carbon monoxide content not dangerous This calculation was further supported by the fact that eighteen persons who remained in the tunnel during the test for a continuous period of forty minutes experienced no unpleasant sensations from breathing the air. The contaminated air in this particular test showed .075 per cent. carbon monoxid, and 6 per cent. carbon dioxid, which proved that the per cent. of carbon monoxid was so small as to be negligible. With the data thus obtained, it was calculated that air supply fans with a maximum capacity of 360,000 cubic feet of fresh air per minute, and exhaust fans having 20 per cent. more capacity, would be required to ventilate the tunnel. The total amount of horse-power computed for operating these fans was 750 H.P. The length of the proposed tunnel under the Hudson, from portal to portal, would be approximately 9,400 feet, with a distance of about one mile, or somewhat over 5,000 feet between the bulkhead lines.

As aforementioned, London has built two vehicular tunnels under the Thames, one 6,200 feet long, the other 6,883 feet. Public interest in tunnels for New York was aroused about thirty years ago by Austin Corbin, who proposed tubes under both the Hudson and East Rivers. Scientists charted the bottoms of the two rivers and reported that tunnel construction was feasible. Perhaps it might have been undertaken at that time but for Mr. Corbin's death. Twenty years later William G. McAdoo undertook this work. President Cassatt, of the Pennsylvania, persuaded his directors to authorize the construction of tubes under the Hudson, also under Manhattan Island, extending under the East River to Long Island.

The total underwater section of the tube will be about 1 3/5 miles, and it is conservatively estimated that it will have a daily capacity of approximately 100,000 vehicles. Statistics compiled from data of 1917 show that during that year 4,800 vehicles crost over the five ferry lines between New York and New Jersey in the vicinity of the proposed tunnel every day. The material thru which the trench must be dug is soft silt and mud.

COMING INVENTIONS 2

THE THOUGHT RECORDER

By H. GERNSBACK

When the writer first conceived the idea of the thought recorder, he asked three prominent scientists regarding their views on recording thoughts electricolly. The letters are reproduced herewith excerpted. It will be noted that Nikola Tesla disagrees with the writer as to thought transmission at all, but his letter nevertheless will give considerable food for thought to many readers.

Dr. Lee de Forest, inventor of the audion, is not too sure about thought transmission.

Dr. Greenleaf Whittier Pickard, the inventor of the silicon and pericon detector, as well as many other wireless specialties, has several interesting ideas, and his letter will certainly prove a revelation, particularly to those interested in radio.

IN studying the evolution of the human specie we must go back to the time when man proper, as we know him, had not as yet arrived on this planet. Our great biologists have irrefutable evidence that everything in Nature works on a slow, laborious plan, one specie being developed slowly into another from the smallest animalculae up to present man. When man was still in the what we may call animal stage, i.e., when he was not "thinking," as that term is understood, he was wholly guided by instinct. His "thoughts," if so they may be called, were probably on a much lower plane than thoughts of the average dog. The chances are that the present day dog probably "thinks" much better than prehistoric man. We also find that thought and language go hand in hand. Crudely speaking, prehistoric man had no better language than any highly developed animal, such as a dog, cat or a horse.

Thru thousands of years of evolution, however, instinct developed into crude thought, and finally there came a time when prehistoric man really began to think, as we know the term. That was the time when he began to utter his thoughts by means of his voice. At first only a few crude words were formulated, and probably consisted of not much more than the gibberish of a chimpanzee. Little by little organized thought arrived, and words, translated into speech kept pace with the advancing thought of man. As the human race kept advancing at a slow pace, its thinking qualities increased little by little, and the senses correspondingly became more sharpened.

This is especially true of the human thinking machinery which perhaps has advanced more rapidly than the senses. Thus we find that certain senses have even been retarded, such as, for instance, sight, smell and hearing. When man lived his wild life it was very necessary for these senses to be much sharper than they are at present; hence our poor hearing, bad sight and very much poorer smell. On the other hand, as the battle for existence becomes more and more acute, and as moreover the battle is not as much physical as mental, it follows that the mind and its thinking machinery should naturally become more and more developed, which, in fact, it does. We may safely say that within the next hundred thousand years—which is only a small span of time in man's evolution—the human mind will be an entirely different sort of apparatus than it is today. Man's mental power will be infinitely greater than what it is at present. Already we have indications that man's thoughts, or the effects therefrom, do not necessarily have to remain *within* his skull, but that they actually radiate from the latter in a very imperfect manner. As the human race advances, there is no doubt that thought transference proper will become an accomplished fact. It has already been shown experimentally by Di Brazza, as well as Charpentier, that concentrated thinking will produce certain external effects, as for instance, a slight fluorescence on a zinc sulfid screen, or a suitably excited X-ray screen. This would tend to prove that thoughts are of an electrical nature, having probably a very short wave length. As most electrical effects in space are depend-

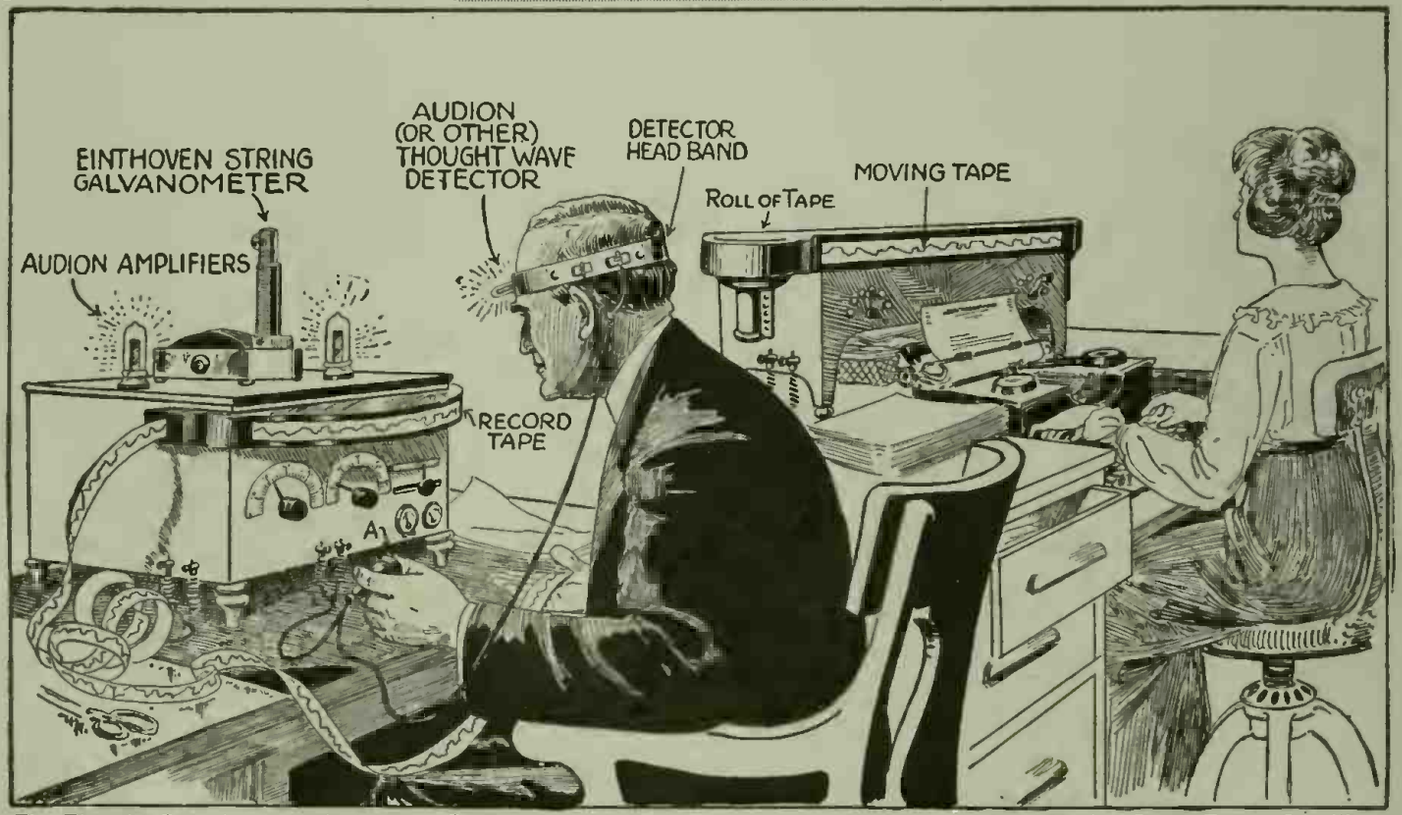
(*Continued on page 84*)

THREE FAMOUS SCIENTISTS' VIEWS ON THOUGHT TRANSMISSION

Altho I am clinging to ideals, my conception of the universe is, I fear, grossly materialistic. As stated in some of my published articles, I have satisfied myself thoroly thru careful observation carried on for many years that we are simply automata acting in obedience to external influences, without power or initiative. The brain is not an accumulator as commonly held in philosophy, and contains no records whatever of a phonographic or photographic kind. In other words, there is no stored knowledge or memory as usually conceived, our minds are blanks. The brain has merely the quality to respond, becoming more and more susceptible as the impressions are often repeated, this resulting in memory.

There is a possibility, however, which I have indicated years ago, that we may finally succeed in not only reading thoughts accurately, but reproducing faithfully every mental image. It can be done thru the analysis of the retina, which is instrumental in conveying impressions to the nerve centers and, in my opinion, is also capable of serving as an indicator of the mental processes taking place within. Evidently, when an object is seen, consciousness of the external form can only be due to the fact that those cones and rods of the retina which are covered by the image are affected differently from the rest, and it is a speculation not too hazardous to assume that visualization is accompanied by a reflex action on the retina which might be detected by suitable instruments. In this way it might also be possible to project the reflex image on a screen, and with further refinement, resorting to the principle involved in moving pictures, the continuous play of thoughts might be rendered visible, recorded and at will reproduced.

Nikola Tesla.



Your article should be an interesting one, particularly as to the audion suggestion. The audion, however, seems to have a certain wavelength limitation, so that unless the waves to be recorded lie between about 3×10^{10} cm. and 3×10^{2} cm., they are not apt to be "picked up."

A more likely range to search would be from 3×10^{2} cm. down to 3×10^{10} cm., that is, down to the harder Gamma rays, or to even shorter wavelengths, starting with the shorter Hertzian waves. Here the audion would be useless, save as a second stage in the detection, i.e., as an amplifier for some other form of detector.

Greenleaf W. Pickard.

While I have little doubt that there is such a thing in nature as transference of thought from one brain to another, I am not aware that sufficient data has ever been gathered on such a highly abstruse subject to permit forming any definite opinion.

Lee De Forest.

The Thought Recorder is an Instrument Recording Thoughts Directly by Electrical Means, On a Moving Paper Tape. Our Illustration Shows What a Future Business Office Will Look Like When the Invention, Which as Yet Only Exists In the Imagination, Has Been Perfected. By Pushing the Button A, the Tape is Started and Stopt Automatically So That Only Thoughts That Are Wanted Are Recorded.

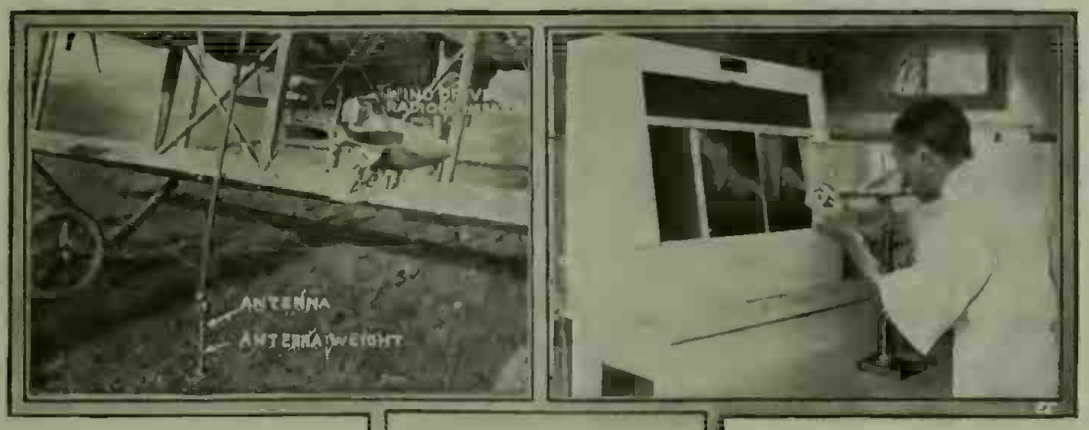
Paris Letter



By JACQUES BOYER

Paris Correspondent of the ELECTRICAL EXPERIMENTER

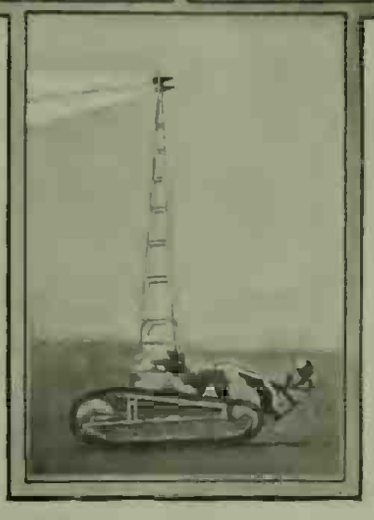
Airplane-Radio.

Paris, February, 1919.

THE war having ended thru the conclusion of the armistice, the military censor now allows the publication of information concerning various technical matters of the French Army. In this and in the following monthly letters, we will unfold thru the ELECTRICAL EXPERIMENTER the latest European technical developments as they come to our attention.

French airplane radio generator of the wind driven type and antenna employed. The dynamo is fitted with a small air blade which spins it rapidly. The antenna and weight are lowered from a reel on the cockpit. Similar schemes are in use on American Airplanes. Fig. 1.

The "Radio-stereoscope" is the latest in French X-ray apparatus. By its means it now becomes possible to rapidly locate bullets or fractures — owing to the perspective of vision thus afforded. The X-ray plates are illuminated from behind, while the physician views them thru the special coördinating instrument shown. Fig. 3.



Particularly during the war, the censorship has been so rigid that many important inventions have never been even mentioned in the technical press. We shall be glad to describe these monthly for the benefit of EXPERIMENTER readers.

The accompanying photographs show the latest system of radio-telegraphy installed on French Airplanes during the war. Fig. 1 shows what is called the "radio-telegraph dynamo" on a Farman airplane.

All the French combat machines were equipt with this or similar apparatus. Between 25 and 150 kilometers could be covered by means of this apparatus weighing some thirty odd kilograms. For receiving the wireless waves the aviators of course used the audion, and by use of sound-proof helmets, it was possible to receive the orders clearly, notwithstanding the terrific noise of the airplane motor. The small dynamo shown in Fig. 1 is operated by means of a small air propeller, and this motor works entirely independent from the power plant of the airplane. As long as the airplane is in motion the propeller will turn due to the rush of the air, and thus even if the engine becomes stalled, the aviator can still use his wireless, for the 'plane while volplaning down furnishes enough energy to drive the small auxiliary dynamo. The wireless antenna trails behind the airplane thru the steel tube as seen in Fig. 1, at the end of which there is a small pulley. At the free end of the antenna wire there is a weight of two or three kilograms (4 to 6 pounds) which tends to keep the antenna more or less taut. The wire stays of the airplane themselves form the "ground" for the wireless system. All aviators in the air were constantly in touch with each other, and in order that one airplane should not be mistaken for another one, different wave lengths were used for each. Not only this, but other tricks as for instance, sending at a different intensity, was often resorted to by certain aviators in order that the ground station would know from which 'plane the signals emanated.

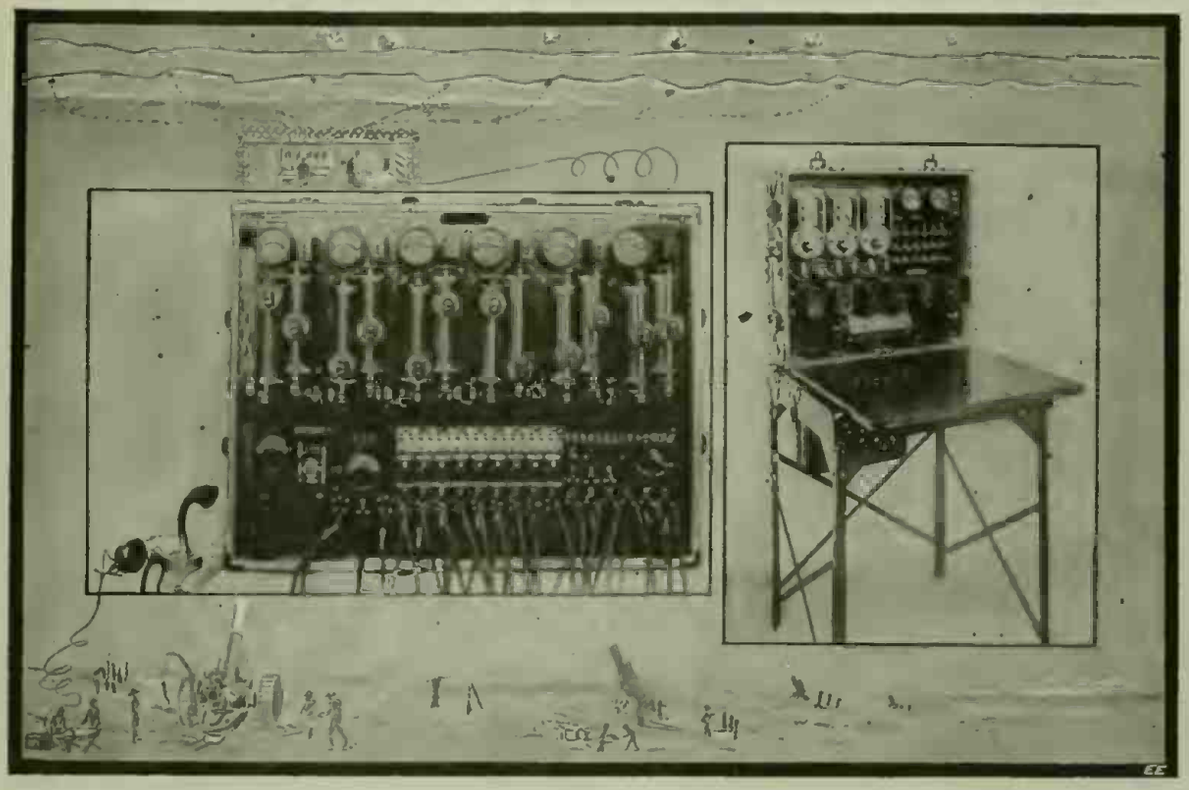
Signaling Tanks.

The "baby" Renault tanks now well known in the United States, played an important rôle in pushing back the Huns. They had not a little to do with the Allied victory and were constructed by the French engineer, Louis Renault. This well-known French technician created many different models, some of which carried cannon and machine guns, while others merely carried ammunition. One of the strangest ones constructed by him is the "*tank projecteur*" (signaling tank). It is shown in the accompanying photograph, Fig. 2. This tank is built along the lines of the "baby" tank,

The "Baby" Renault Tanks Played an Important Rôle in Pushing Back the Huns. Some of These Tanks Carried Cannon and Machine Guns. The "Tank Projecteur" Here Shown Was Effectively Used for Signaling Purposes. Fig. 2.

> The war has brought forth a great many surprises, many of which for military reasons having remained secret, and many will continue a secret for some time to come. Our readers no doubt are very much interested in many of the war devices brought out during the war by our European Allies. We have therefore made arrangements with our Paris correspondent, Mr. Jacques Boyer to send us an article each month on hitherto unpublished information. The first article of the series appears on this page.—*Editor.*

but in the back we find on an inclined steel truss a little dynamo driven by the machinery of the tank. Two "signaling projectors" are mounted at the top of a light metallic mast, the four lower legs of which are mounted on a revolving cupola which makes it possible for the mast to be immediately revolved in any direction. The top of the mast is 7½ meters from the ground. The two searchlights are arranged in such a manner that they can send out two independent light shafts, or the two shafts can be converted into a single shaft of light. In the inside of the tank we find our usual Morse telegraphers, operating a key which controls the light shafts. By means of this arrangement, the ordinary Morse or Continental Code can be sent out by breaking up the light shaft into "dots and dashes" the same as is done in the usual method of signaling with lights. Mr. Renault has incorporated several refinements into the search lights, one of which is an iris obturator whereby the volume of the light can be increased or decreased at will.



Radio-stereoscope.

This apparatus has been developed by the French engineer, M. Nemirovsky, the X-ray specialist of Paris. It has given wonderful results to the French military physicians, and it now becomes possible to locate metallic or other foreign pieces in the human body in a manner not possible before. The ordinary X-ray photograph shows only the foreign body, but it is impossible to tell how deep the penetration is, and often the physician cannot tell if a bullet is in front or in back of a certain organ. In other words, he does not know just how deep the bullet is embodied. Everyone who has looked thru the ordinary stereoscope will readily understand how objects "stand out" and how they reveal their exact location to the human eye.

It is this principle which is made use of by M. Nemirovsky, who has also greatly simplified the radio-stereoscope technique. Our illustration, Fig. 3, shows the method. Two X-ray pictures taken at one time by super-imposing two plates and afterward developing them are placed side by side in an arrangement termed a "*negatoscope.*" The plates are illuminated from behind by means of an electric lamp. The physician then regulates the radio-stereoscope by means of a thumb screw as shown, until he sees the bones, and all other parts as well. The foreign body then stands out in plain relief. The physician now examines the plates carefully and he obtains a clear mental picture which subsequently gives him an exact idea as to just how deep the foreign body is emplaced. If necessary during the operation, he can frequently inspect the negatives stereoscopically in order to guide himself should this be necessary.

Locating Enemy Guns by Flash and Sound

Switchboards Used for Flash or Sound Spotting of Enemy Artillery. Photo at Left Shows a Type B-T Sound Ranging Set Such as Used By the United States Army Signal Corps During the War. Many of These Switchboards Were Successfully Used At the Front. It Is Slightly Larger Than the Smaller Model and Requires a Little More Time to Set Up, But On the Other Hand It Combines Many More Telephone Circuits. A Single Section Has Located as High as 117 Guns of Enemy Batteries In 24 Hours. The Right Hand Photo Shows a Small Portable Switchboard, Known as a Flash Ranging Set. This Signal Board Is Used in Conjunction With an Observation Telescope for Locating the Flash of Enemy Guns and General Activities At the Extreme Front, and is Suitable for Night or Day Service.

THE accompanying photographs show respectively two of the war's newer developments, which even the veterans of the Spanish-American War were not familiar with. For one thing, of course, "flash ranging" and "sound ranging," as they are called, are really two military developments which were brought about by the fact that vastly greater numbers of guns were used in the great world war than were ever even dreamed of before.

Let us first consider the "flash spotter." The flash spotter usually takes up his location in the vicinity of front line trenches, or in a shell hole from which he can effectively use an observation telescope for minutely observing and locating in what direction the flash of an enemy gun occurs. The electrical switchboard shown herewith forms a part of the communication link with the artillery and general intelligence headquarters, so that the position of the enemy guns can be quickly made known, and either shelled at once by counter-battery fire by the artillerists, or else the location is accurately plotted on large maps for future consideration, depending upon the activity of the enemy gun or guns at the moment.

The flash spotter, if he happens to be located in a listening post or shell hole, or in fact in any other forward location, invariably has with him his trusty portable telephone connected by wire to the nearest communicating depot, where we find one of the small portable switchboards here shown. These switchboards are fitted with the proper regulating instruments for creating the best working conditions on the various circuits, and make provision for connecting and disconnecting a large number of circuits, in some cases, about 30 or 40 lines running out to various flash ranging observation stations, or in other cases as many as 100 or more lines. The work of the flash spotter is finished for any particular case when his observations, as to the angle in which the flash was observed, and a similar or different angle measured by a co-observer somewhere down the line, have reached the engineers. These experts, by means of special slide rules and tables, quickly solve the distance of the enemy gun and its definite location geographically by the information afforded thru the observation data submitted by two or more flash ranging observers. In other words, it is *triangulation*, which mathematical quantity has been raised to the n'th power by Uncle Sam's artillery experts.

The work of the "sound ranging" experts in locating enemy guns, both large and small, is somewhat different from that of the flash ranging corps. One of the switchboards used in connection with the sound ranging of enemy guns is illustrated herewith. Hundreds of these switchboards were successfully used at the front during the progress of the war. A single section of sound-ranging equipment located as high as 117 guns of enemy batteries in 24 hours.

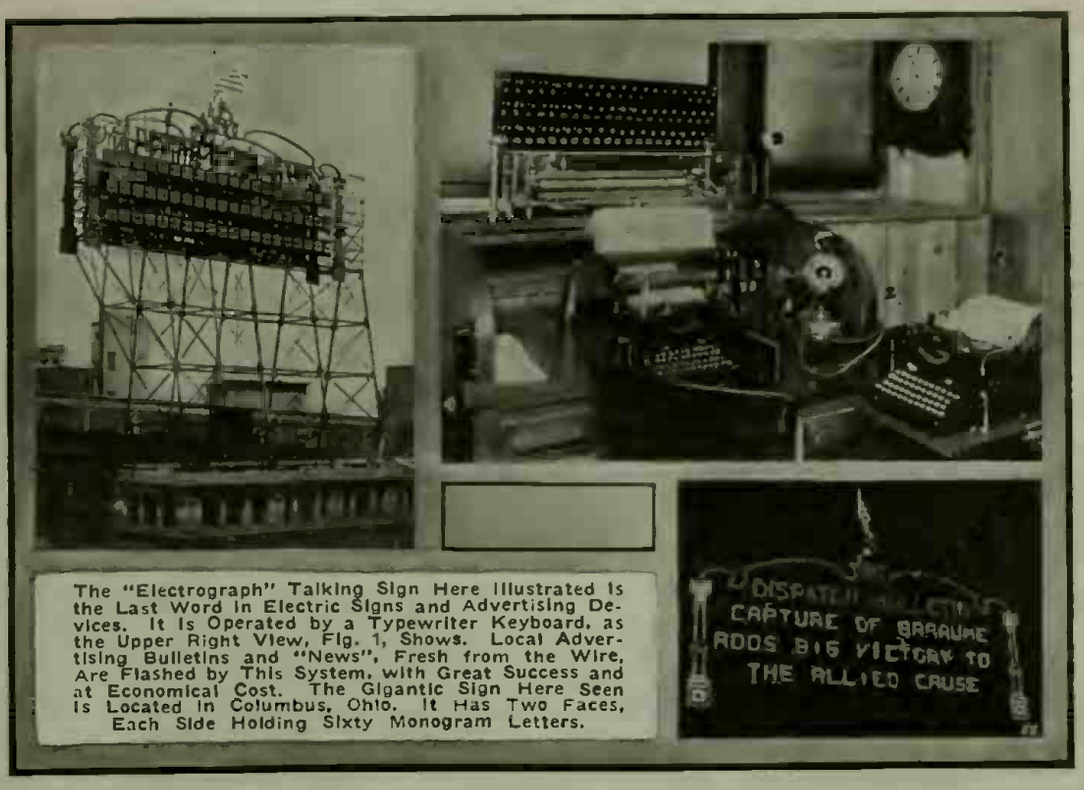
World's Largest Generator

The accompanying illustration shows one of the largest water-wheel type generators ever built, and its gigantic dimensions may be judged by comparison with the figure of the man standing beside it. This is one of several water-wheel generators built for the Keokuk electric generating station of the Mississippi River Power Company. This mastodonic generator has 52 poles and delivers a current at 11,000 volts potential. This is a high voltage for a generator to produce, owing to the strains on the revolving windings, etc. Much higher voltages are frequently used for the transmission line, and voltages of 50,000 to 75,000 are common for such transmission, these extra high potentials being obtained by means of stationary transformers in the power station where the generators are located.

The large field or stator frame here shown forms the stationary part of the generator, and the rotating member which is also of gigantic size and mounted on a steel shaft several feet in diameter, is put in place and lined up with high accuracy when the stator frame of the generator is put in place and bolted to its foundation. These large machines are invariably built in sections which can be bolted together after they have reached the site of their installation.

The transformer comprises a laminated sheet iron core on which there are two windings or series of windings, one of which forms a low voltage primary which is connected with the generator, driven by a water-wheel or other source of primary power; while the second set of windings form a high voltage or secondary circuit, in which any desired potential current is induced by induction, the primary and secondary windings being linked magnetically by means of the iron core. Transmission lines are in use at the present day with potentials of 150,000 volts and higher.—*Photo Courtesy G. E. Co.*



Note the Relative Size of the Man Compared to the Huge Stator of the Largest Water-Wheel Type Generator Ever Built. It Develops a Current of 11,000 Volts.

Novel Electric Talking Sign

THE accompanying illustrations, Figs. 1, 2 and 3, show the design, construction and method of operation of an electric bulletin board, operated by a typewriter, which is said to be the latest achievement in the electric sign industry. This new illuminated sign called the *Electrograph* has been erected on the Dispatch Building in Columbus, Ohio, and flashes the latest news, fresh from the press wires, and advertising bulletins for local and national concerns.

It may be stated that this Illuminated Sign has two sides, each side holding sixty monograms, arranged in three rows. Each monogram contains a clever arrangement of twenty-one lights, combinations of which form any letter or numeral and a few other characters, each one measuring two by three feet.

The "Electrograph" Talking Sign Here Illustrated Is the Last Word In Electric Signs and Advertising Devices. It Is Operated by a Typewriter Keyboard, as the Upper Right View, Fig. 1, Shows. Local Advertising Bulletins and "News", Fresh from the Wire, Are Flashed by This System, with Great Success and at Economical Cost. The Gigantic Sign Here Seen Is Located in Columbus, Ohio. It Has Two Faces, Each Side Holding Sixty Monogram Letters.

The photograph Fig. 1 shows the operating room. The typewriter method of operation distinguishes this device from others of similar character. A standard machine is used and contacts are made by striking the keys just as they would be struck in ordinary typing. An extra platen, bearing silver plugs, over which a stylus rides, selects the monograms automatically as the writing proceeds, thus throwing the letters in their proper places on the sign. The letters remain in place until the bulletin is completed and may be held any length of time; it is then released by pressing a single key.

It is of interest to note that a unit releasing device enables the operator to strike any one letter out and replace it with another without interfering with the other letters. Thus, if an error is made, it may be promptly corrected. The operator cannot see the sign as he works and so a pilot board has been provided directly in front of him, consisting of sixty green light bulbs, corresponding to the sixty monograms on either face of the board. When a letter is struck, with the platen set at any given position, the letter appears in the corresponding monogram and automatically lights the corresponding green light.

For illustration, it will be seen that if the platen is set with the stylus on No. 3 plug and the letter "K" is struck, "K" will appear in the monogram and green light No. 3 will burn. If it does not burn, the operator knows that the "K" failed to appear in the monogram and he strikes it again. When the operator writes a bulletin, the typewriter keys write on paper in the usual manner. This gives a complete record of everything that appears on the board. The record is used in checking advertising.

It is claimed that an ordinary bulletin may be written in ten seconds. It usually is left burning ten or more seconds after being completed. This indicates the amount of advertising and news that may be flashed in an evening.

Mr. Alton D. Spencer, of the *Evening Dispatch*, points out that the news feature gives the electrograph an advertising pull not possible with ordinary electric signs. Latest news from the peace table fronts is bound to attract attention, and while the crowds watch for news, they read the advertisements. On election night the electrograph is the center of attraction, as the returns are flashed more promptly than is possible by any other means. This service, of course, increases the value of the sign to the advertisers and gets more results from them than they could get from a sign hanging in front of their places of business and at less cost.—*By Frank C. Perkins.*

Relieving the Car Crush

By Sidney Gernsback

HAVE you ever seen a Subway crowd being herded into a car? Of course you have, if you are living in "little old New York." If not, thank the Lord and turn to the next page. You are not interested! Not at all! And then again you may get a notion to visit that "Burgh" one day; well, read on, it may interest you after all!

Let us go back to that Subway crowd on a rainy Monday morning between 8 and 9 A. M. and let us try to board a car at Times Square. There our train stops, packed brimful with its rain-smelling, sneezing and coughing cargo. You think there is not room for as much as another umbrella in the car you have selected. But behold the convulsory jerking and pushing going on in the middle of the car. Our well trained eye reads these signs, like an Indian would read footprints on the warpath: These spasmodic movements, this pushing, twitching and thrusting can mean only one thing: somebody wants to get off that train! And if somebody wants to get off, a half dozen other bodies want to get on, and usually do, too.

The Cure for the "Subway Crush".—There Are Three Doors on Each Subway Car: Two on Each End and One, About the Same Size as the Front and End Door Combined, in the Center. Let the Outgoing Passengers Use the End Doors Only, and the Incoming Travelers the Center Doors Only, as the Diagram Indicates.

Acting on this well established principle we push and get pushed toward the open car door. A melodious voice from the end of the car sings out: "Let 'em get off! Let 'em get off!" And behind you a gentleman wearing the snug uniform of a Subway gladiator pushes on: "Step lively!"

And right here it is where Kipling is wrong about that east and west business "who never shall meet!" Take it from an old Subway traveler: *they do meet!* They not only meet! They clash and they col-

My Inventions

By Nikola Tesla

IV. The Discovery of the Tesla Coil and Transformer

FOR a while I gave myself up entirely to the intense enjoyment of picturing machines and devising new forms. It was a mental state of happiness about as complete as I have ever known in life. Ideas came in an uninterrupted stream and the only difficulty I had was to hold them fast. The pieces of apparatus I conceived were to me absolutely real and tangible in every detail, even to the minutest marks and signs of wear. I delighted in imagining the motors constantly running, for in this way they presented to the mind's eye a more fascinating sight. When natural inclination develops into a passionate desire, one advances towards his goal in seven-league boots. In less than two months I evolved virtually all the types of motors and modifications of the system which are now identified with my name. It was, perhaps, providential that the necessities of existence commanded a temporary halt to this consuming activity of the mind. I came to Budapest prompted by a premature report concerning the telephone enterprise and, as irony of fate willed it, I had to accept a position as draftsman in the Central Telegraph Office of the Hungarian Government at a salary which I deem it my privilege not to disclose! Fortunately, I soon won the interest of the Inspector-in-Chief and was thereafter employed on calculations, designs and estimates in connection with new installations, until the Telephone Exchange was started, when I took charge of the same. The knowledge and practical experience I gained in the course of this work was most valuable and the employment gave me ample opportunities for the exercise of my inventive faculties. I made several improvements in the Central Station apparatus and perfected a telephone repeater or amplifier which was never patented or publicly described but would be creditable to me even today. In recognition of my efficient assistance the organizer of the undertaking, Mr. Puskas, upon disposing of his business in Budapest, offered me a position in Paris which I gladly accepted.

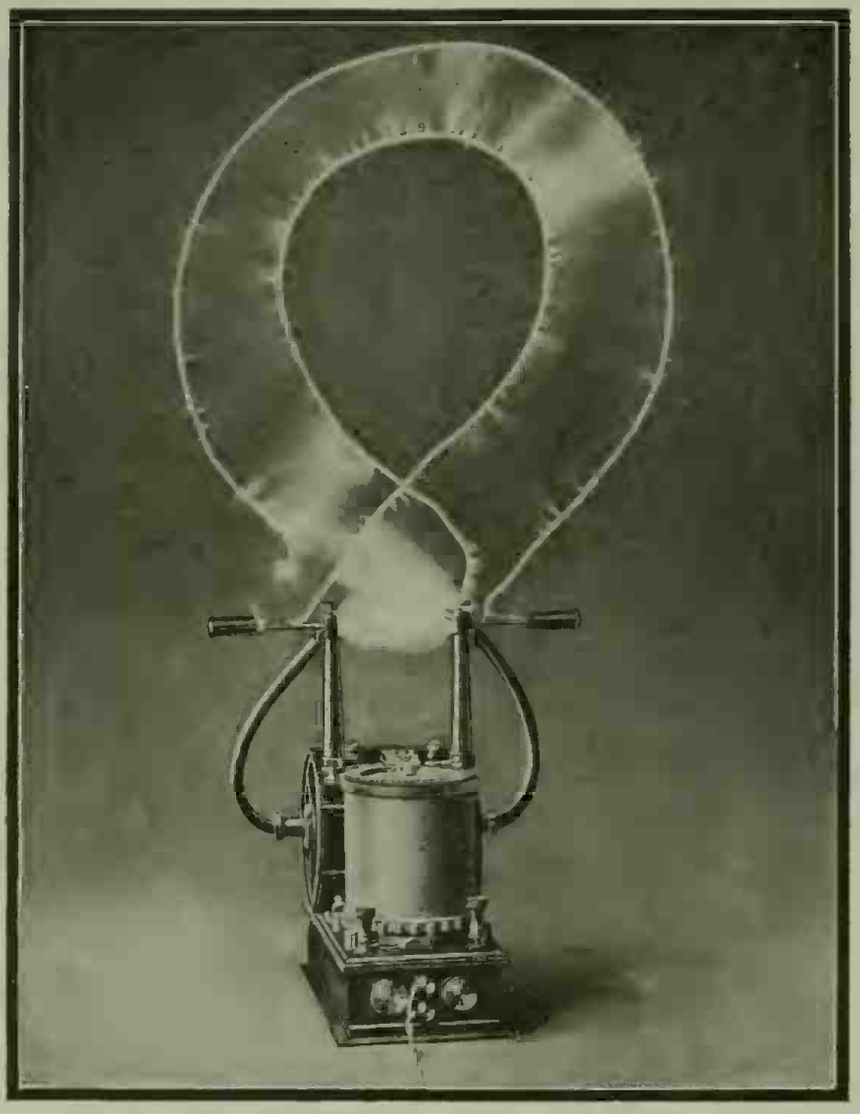

Fig. 1—Tesla Oscillation Transformer (Tesla Coil) Presented by Lord Kelvin Before the British Association in August, 1897. This Small and Compact Instrument, Only 8 Inches High, Developed Two Square Feet of Streamers With Twenty-Five Watts From the 110 Volt D. C. Supply Circuit. The Instrument Contains a Tesla Primary and Secondary, Condenser, and a Circuit Controller.

I never can forget the deep impression that magic city produced on my mind. For several days after my arrival I roamed thru the streets in utter bewilderment of the new spectacle. The attractions were many and irresistible, but, alas, the income was spent as soon as received. When Mr. Puskas asked me how I was getting along in the new sphere, I described the situation accurately in the statement that "the last twenty-nine days of the month are the toughest!" I led a rather strenuous life in what would now be termed "Rooseveltian fashion." Every morning, regardless of weather, I would go from the Boulevard St. Marcel, where I resided, to a bathing house on the Seine, plunge into the water, loop the circuit twenty-seven times and then walk an hour to reach Ivry, where the Company's factory was located. There I would have a woodchopper's breakfast at half-past seven o'clock and then eagerly await the lunch hour, in the meanwhile cracking hard nuts for the Manager of the Works, Mr. Charles Batchellor, who was an intimate friend and assistant of Edison. Here I was thrown in contact with a few Americans who fairly fell in love with me because of my proficiency in—billiards. To these men I explained my invention and one of them, Mr. D. Cunningham, Foreman of the Mechanical Department, offered to form a stock company. The proposal seemed to me comical in the extreme. I did not have the faintest conception of what that meant except that it was an American way of doing things. Nothing came of it, however, and during the next few months I had to travel from one to another place in France and Germany to cure the ills of the power plants. On my return to Paris I submitted to one of the administrators of the Company, Mr. Rau, a plan for improving their dynamos and was given an opportunity. My success was complete and the delighted directors accorded me the privilege of developing automatic regulators which were much desired. Shortly after there was some trouble with the lighting plant which has been installed at the new rail-

Mr. Tesla's articles started in our February issue

www.americanradiohistory.com

road station in Strassburg, Alsace. The wiring was defective and on the occasion of the opening ceremonies a large part of a wall was blown out thru a short-circuit right in the presence of old Emperor William I. The German Government refused to take the plant and the French Company was facing a serious loss. On account of my knowledge of the German language and past experience, I was entrusted with the difficult task of straightening out matters and early in 1883 I went to Strassburg on that mission.

The First Induction Motor Is Built.

Some of the incidents in that city have left an indelible record on my memory. By a curious coincidence, a number of men who subsequently achieved fame, lived there about that time. In later life I used to say, "There were bacteria of greatness in that old town. Others caught the disease but I escaped!" The practical work, correspondence, and conferences with officials kept me preoccupied day and night, but as soon as I was able to manage I undertook the construction of a simple motor in a mechanical shop opposite the railroad station, having brought with me from Paris some material for that purpose. The consummation of the experiment was, however, delayed until the summer of that year when I finally had the satisfaction of *seeing rotation effected by alternating currents of different phase, and without sliding contacts or commutator*, as I had conceived a year before. It was an exquisite pleasure but not to compare with the delirium of joy following the first revelation.

Among my new friends was the former Mayor of the city, Mr. Bauzin, whom I had already in a measure acquainted with this and other inventions of mine and whose support I endeavored to enlist. He was sincerely devoted to me and put my project before several wealthy persons but, to my mortification, found no response. He wanted to help me in every possible way and the approach of the first of July, 1919, happens to remind me of a form of "assistance" I received from that charming man, which was not financial but none the less appreciated. In 1870, when the Germans invaded the country, Mr. Bauzin had buried a good sized allotment of St. Estèphe of 1801 and he came to the conclusion that he knew no worthier person than myself to consume that precious beverage. This, I may say, is one of the unforgettable incidents to which I have referred. My friend urged me to return to Paris as soon as possible and seek support there. This I was anxious to do but my work and negotiations were protracted owing to all sorts of petty obstacles I encountered so that at times the situation seemed hopeless.

Fig. 2—This Illustrates Tests With Spark Discharges From a Ball of Forty Centimeters Radius in Tesla's Wireless Plant Erected at Colorado Springs in 1899. The Ball Is Connected to the Free End of a Grounded Resonant Circuit Seventeen Meters in Diameter. The Disruptive Potential of a Ball, Is, According to Tesla, in Volts Approximatelly V = 75,400 r (r Being in Centimeters), That Is, in This Case 75,400 x 40 = 3,016,000 Volts. The Gigantic Tesla Coil Which Produced These Bolts of Thor Was Capable of Furnishing a Current of 1,100 Amperes in the High Tension Secondary. The Primary Coil Had a Diameter of 51 Feet! This Tesla Coil Produced Discharges Which Were the Nearest Approach to Lightning Ever Made by Man.

German "Efficiency".

Just to give an idea of German thoroness and "efficiency," I may mention here a rather funny experience. An incandescent lamp of 16 c.p. was to be placed in a hallway and upon selecting the proper location I ordered the *monteur* to run the wires. After working for a while he concluded that the engineer had to be consulted and this was done. The latter made several objections but ultimately agreed that the lamp should be placed two inches from the spot I had assigned, whereupon the work proceeded. Then the engineer became worried and told me that Inspector Averdeck should be notified. That important person called, investigated, debated, and decided that the lamp should be shifted back two inches, which was the place I had marked. It was not long, however, before Averdeck got cold feet himself and advised me that he had informed *Ober-Inspector* Hieronimus of the matter and that I should await his decision. It was several days before the *Ober-Inspector* was able to free himself of other pressing duties but at last he arrived and a two-hour debate followed, when he decided to move the lamp two inches farther. My hopes that this was the final act were shattered when the *Ober-Inspector* returned and said to me: "*Regierungsrath* Funke is so particular that I would not dare to give an order for placing this lamp without his explicit approval." Accordingly arrangements for a visit from that great man were made. We started cleaning up and polishing early in the morning. Everybody brushed up, I put on my gloves and when Funke came with his retinue he was ceremoniously received. After two hours' deliberation he suddenly exclaimed: "I must be going," and pointing to a place on the ceiling, he ordered me to put the

(*Continued on page 64*)

THE proverbial trials and tribulations known to every inventor were not spared Tesla, the world's greatest inventor of all times. In this article we see him, arrived at young manhood, struggling along in a cold world. Already his fame has spread far and wide and his genius is recognized. But converting genius and fame into dollars and cents is quite a different matter, and the world is full of unappreciative and unscrupulous men. Tesla, the idealist, cared little for money and thus was promptly taken advantage of. But let Tesla himself tell you in his own inimitable style. It is a wonderful story.

In this month's installment Tesla also tells us how he made one of his most important as well as sensational discoveries—the Tesla Coil. Few inventions have caused such a sensation as this one which culminated in the only man-made lightning ever produced. The Tesla coil has so many uses and has been built in so many styles that it would take a catalog to list them all. From the spectacular high frequency stunts on the stage down to the "violet" ray machine in your home; all are Tesla coils in one form or another.

Wireless without the Tesla Coil would not be possible today. Without an oscillation transformer, spark gap and condenser—which is a Tesla Coil—the sending station would be crippled.

But it is for industrial purposes where the Tesla Coil will shine brightest in the future. The production of Ozone, the extraction of Nitrogen from the air in huge quantities—all are children of Tesla's fertile brain. His coil is the key to them all.

The New York Aëro Show

THE aëronautical exposition which was held jointly in Madison Square Garden and the 69th Regiment Armory, New York City, March 1st to 15th, was the most successful aëro show and exposition ever held in the United States. Many remarkable exhibits were shown, including large bombing 'planes, small high-speed pleasure and scouting 'planes, besides a gigantic naval sea plane, of the stations at the Madison Square Garden or 69th Regiment Armory could be establisht with the flying 'planes or dirigibles, and in turn wireless telephonic speech was transmitted from the aircraft to the respective land stations. The effect on the public was startling, as while most of them had undoubtedly read of the wireless telephone, they did not have the slightest idea as to what the apparatus used for the purpose wonderful indeed, to stand in the crowd before the radio exhibit, and hear this conversation flitting back and forth between the operator in front of you and a second operator flying thru the air at a speed of 80 to 100 miles an hour.

One day a captive propaganda balloon broke from its moorings over the Sixty-ninth Regiment Armory and shot into the clouds, spilling leaflets, its anchorage dang-

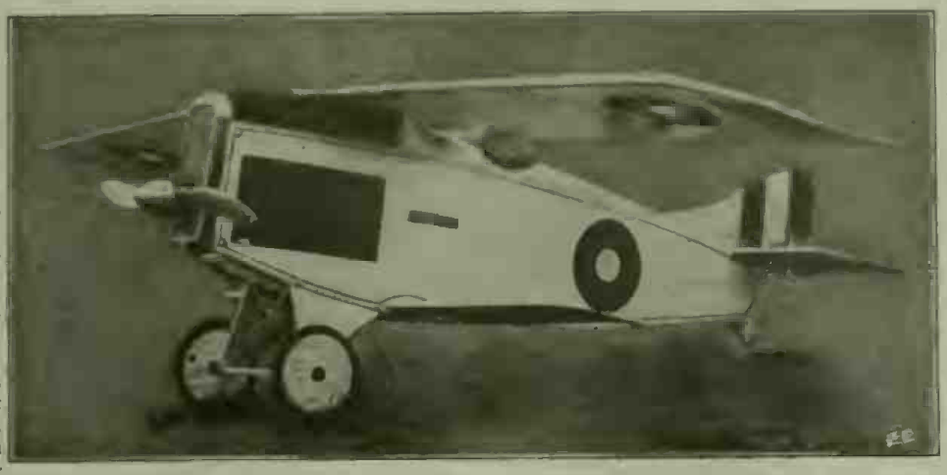
and a powerful Caproni tri-plane. A captured German 'plane of the Albatross type was also exhibited. There were also shown a number of gas type, or lighter-than-air aircraft, such as solo balloons, blimps, a naval dirigible which had seen seventeen months' service on coast patrol work, etc. The "gas bags" were filled with the new balloon gas—Helium. The individual exhibits included many interesting auxiliary appurtenances in the flying world, such as rapid-fire photographic cameras, aircraft machine guns, measuring instruments for indicating the velocity of the 'plane thru the air, et cetera, and a host of other new and highly novel devices.

Radio-telephony was demonstrated by the Army Radio Corps of the Air Division in a very popular and interesting way. During the course of the exposition, various types of aircraft flew over the city, equipt with wireless telephone and telegraph installations, so that communication from either looked like, or how it worked, and many of them had a twisted notion that it had something to do with *telegraphy* somehow or other. However, Uncle Sam's radio experts, as soon as they got the sets up and working, soon showed the visitors how the wireless telephone worked. The roof operator, who is stationed at that point so that he could readily observe the approach of aircraft, would start calling the airplane or dirigible as soon as it came to view, somewhat in this fashion: "Hello airplane! Hello airplane! Hello airplane!" After a few moments' pause, and when the operator had manipulated the tuning of the apparatus to the right point and gotten his Audion detector and amplifiers adjusted to the proper strength, the voice of the pilot on the airplane, hovering in the air several hundred feet above the aëro show, could be heard calling, thru a large Audion amplifier—"Hello land station! I get you all right now, land station!" It was really very ling. Up to approximately 3,000 feet it sailed, where it exploded in a burst of brown smoke, falling upon a roof in the neighborhood of Fifth Avenue. Came the wireless comment from an airplane aloft:

"Did you see that? It burst about a thousand feet under us—ought to make good stuff for the reporters. By the way, are any down there?"

"Yes," broke in a newspaper man standing near the land wireless set, "and will you spell your observer's name for the reporters?"



"Yes—it's Sergeant S-a-u-v-e-g-e-a-u. He had a date to come to New York this afternoon, and altho he's come he can't fill his date very well, unless he comes down and lands on the crankshaft. Anything else?"

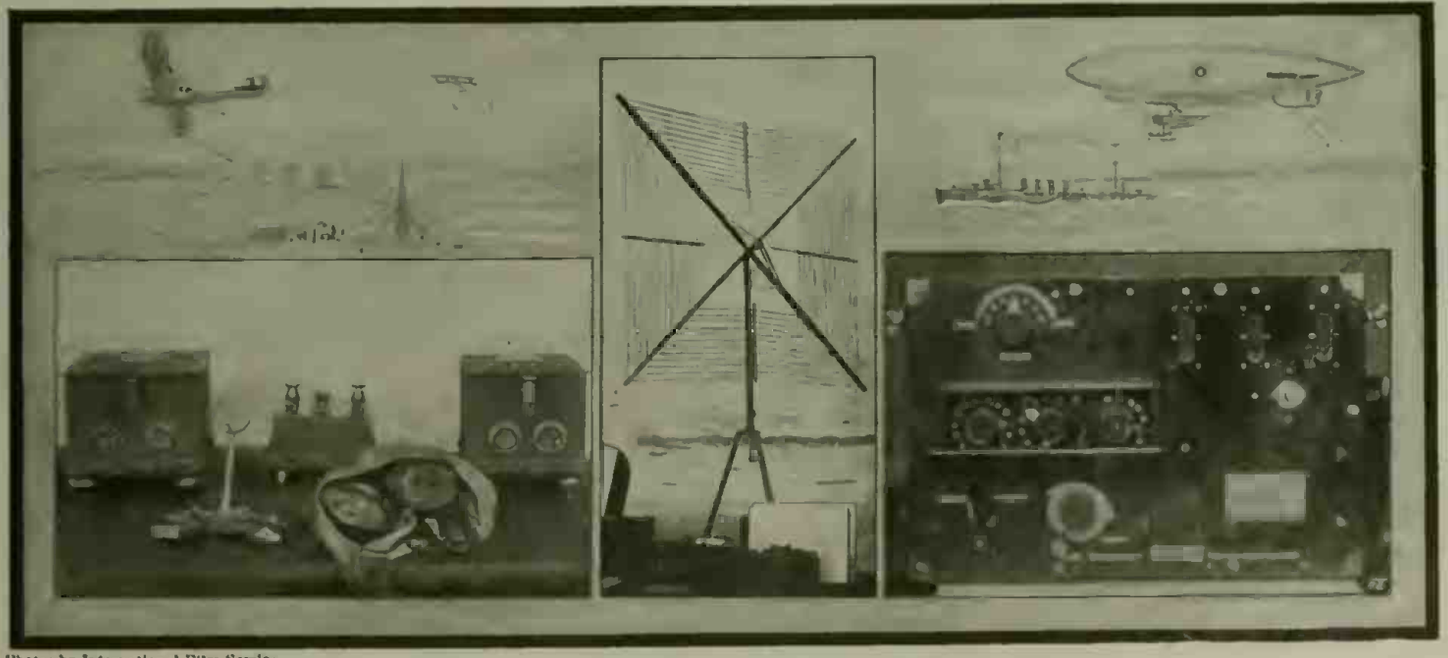
"No, thanks," said the reporter as he hung up on the first *interview* by wireless telephony yet recorded.

The radio apparatus exhibited, including that in the exhibit of the United States

www.americanradiohistory.com

Navy, was that of the vacuum bulb or Audion type. The range of the wireless telephone airplane apparatus for transmitting and receiving speech signals varies, of course, with the size of the transmitting set, the length of the aerials used on the airplane and several other factors. It is interesting to note at this point that only recently Secretary of the Navy Daniels carried on a wireless telephone conversation on March 11th with an airplane flying over the Potomac River at a distance of 150 miles. In this two-way wireless telephone conversation with the Secretary of the Navy, who was located at Washington, he used his ordinary desk telephone, which was connected up to the wireless transmitting set in another building. A recent report states that radio-telegraphic communication from earth to 'plane has been carried on over a distance of 200 miles.

The Fastest Airplane Exhibited At the Aëro Show In New York—The "Christmas Bullet" —Rated Speed 200 Miles Per Hour. Test Showed 185 M.P.H. To Be Used as "Taxiplane" to Deliver Dispatches to Vessels One Day Out At Sea.



The form of antenna used on aircraft during the war has been invariably that employing a quick-acting reel, on which the phosfor bronze stranded antenna cable was wound upon or released from, according to the desires of the pilot. However, in the newer aërial systems as applied to the airplane, not one, but two aërials are utilized, and no reels are employed. Each wire is about 100 feet long, with a two-pound lead weight at the end, and flies out from either extreme of the wings. These wires, contrary to popular conception, are said not to interfere with the maneuvering of the plane at all. One of the officers at the radio exhibit explained that the 'planes can rise and land with these wires outstretched without any trouble. One of the wires forms the aërial, while the other forms a counterpoise ground capacity. The tuning and detecting apparatus are connected between them in the cockpit.

In looking over the wireless equipment on the various 'planes, one was struck by the wide-spread adoption of the wind-driven wireless dynamo, and even the gigantic foreign bombing planes, including the Handley-Page, were fitted with a wind-driven radio generator. This small dynamo is usually mounted just to one side of the fuselage or cockpit, and is rigidly secured to the wing. As the airplane speeds thru the air, the propeller on the small dynamo is rapidly spun, and the necessary current thus produced for operating the radio telephone or telegraph instruments. Whenever an airplane or dirigible was in radio telephonic communication with the station at the show, the most frequent question heard among the audience was: "Why is it that the terrific noise of the airplane engine is not heard above the comparatively weak voice of the pilot?" The explanation is simple when you know how it is done. The explanation for the non-transmission of the airplane engine exhaust noises is as follows: Many weary weeks were spent in special research on this particular problem by experts of the concerns who developed the radio telephone during the war, under great pressure, but thanks to their keen perception of the principles involved in successfully telephoning by radio from a moving vehicle in the air, in proximity to a terrific noise such as produced by the airplane, these engineers had the forethought to finally devise a special sound detecting instrument or microphone, which is strapt to the aviator's breast, and in the front of which there is a metal plate containing three small holes about the size of a needle. The voice waves of the airplane operator impinge directly against this plate, and readily pass thru the small openings in it, thus vibrating the diafram of the microphone, while the violent swirling noises set up by the airplane engine pass by it without affecting the diafram thus protected.

Here are some of the outstanding electrical and other features which appealed to the visitor of the aero show, in looking over the airplanes of all designs, both large and small. On one of the 'planes one found *red* and *green* signal lights, which were placed respectively on the extreme outer ends of the lower wing. Another novelty was the electric searchlight of small size, mounted over the cockpit so as to be rapidly manipulated by the pilot or his assistant, for the purpose of making landings at night or helping to locate the enemy in a night attack. Many interesting exhibits were on hand of the various magneto ignition systems. A beautiful model was shown of a spark phase-angle indicator, which roused great interest among the spectators, as the sparks staggered around the edge of a rapidly revolving two-foot black disc, which was covered over with sheet glass. Of course, there were electric lights in the aviators' quarters, or cockpit, besides many other electrical and allied features of great interest, such as signaling systems between the pilot and the observer, provision for supplying current to the electrically-heated aviator's clothes, which the aviators always wear on long distance trips, or in night flying when it is particularly cold.

Other exhibits included luminous radium dial measuring instruments and gages, electro-pneumatic and other forms of aerial photographic apparatus, some of which operated at very high speed, as can be read-

Monster Escalator for New York Subway

THE New York subway system has incorporated in its various ramifications some of the most novel engineering features possest by any similar transportation system in the world. Moving platforms have been suggested and tried in various New York transportation systems, and moving stairways or escalators are not unknown to the metropolis' subway and elevated railroad traveling public by any means. But one of the most interesting and highest lift escalators is now being built at the Park Place and Broadway station of the 7th Avenue Subway, New York City. The accompanying illustration shows a sectional view of this subway innovation, which promises to make this station one of the highest speed stations of its kind in the world.

An Innovation in Escalators is to be Tried Out at the Park Place Station of the Seventh Avenue Subway in New York City. Four Escalators Will be Available, Any Or All of Which May be Operated Either Up Or Down, Depending Upon the Direction of Traffic, Which Is Mostly Eastward in the Morning and Westward at Night.

The four escalators to be finally installed will be *reversible*, and several ways of operating these electric motor-driven moving stairways will be available. In the morning when this downtown station of the great metropolis is flooded with office-bound passengers, then if necessary all four of the escalators may run *upward* to carry the traffic to the street. After about 10 o'clock in the morning when the traffic thins down, until it is about half uptown and half downtown, then two parallel escalators can be upward and the other two downward. If the traffic is quite light, it will be up to the station master to cut out two of the escalators and block them off, running one of the remaining pair upward and the other downward. As the crowd slowly changes and becomes a strong uptown-bound traffic, toward the latter part of the afternoon, then all of the escalators will be run *downward*.

The reason for installing the escalators at this station was because of the fact that the 7th Avenue Subway, which dives under the Interboro Subway, running under Broadway at this point, has to pass under the latter Subway, and as it is located about three levels underground, this renders present climbing to the street up existing stairways a very tedious and laborious exertion, which is almost as bad as climbing the steps of the Washington Monument. Of course, the present staircases will remain in place, as under the condition where north-bound traffic might necessitate operating all of the escalators downward, then passengers arriving on southbound trains would have to gain access up these stairways to the street. It would probably be more expedient to operate three of the escalators downward and one upwards, a problem which the traffic engineers will have to determine by careful check over a considerable period of time, after the escalators have been in operation for a while.

Lightning of All Kinds

Lightning photos are more or less common, and a great number of them have been publisht in the various issues of this Journal from time to time, but one of the most astonishing lightning pictures ever recorded by the camera, is that shown in the accompanying view, which incorporates every form of lightning, such as bead, forked, chain and ribbon, so-called heat or *flash*, and ball lightning. This picture is extremely interesting to all photographers, who have attempted to obtain good photos of lightning discharges. It is quite a trick to photograph lightning in just the way you would like to have it appear on a finished picture.

In some cases, and as is the usual practise, excellent lightning pictures are obtained by waiting for a dark period just after a flash, and then opening the camera shutter, which has previously been set for a time exposure. As soon as the next flash of lightning occurs, the shutter is at once closed, and the plate then developed. This sounds simple, but as Shakespeare said, "There is many a slip twixt the cup and the lip," and one humorous instance comes to mind of an ambitious lightning photographer, who sud-

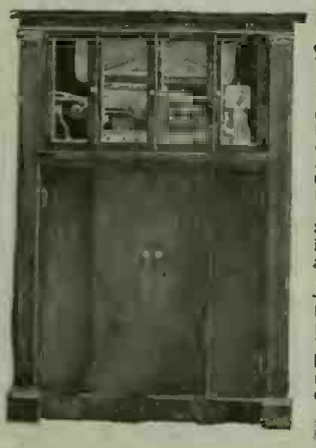
British Submarine Detector

The Views Herewith Show the "Hydrophone" Or Super-Sensitive Sound Detector Used by the British Navy In Clearing the Seas of U-Boats. The Left Hand Photo Shows the Device Being Demonstrated In a Museum, Where a Model "Sub" Lies In a Tank of Water. View at Right Shows a Close-Up of Microphone.



This invention was used extensively and successfully by the British Navy during the war. Wires lead to various stations on the ship, at which listeners are posted. By this means a steady watch is kept and the approach of every undersea craft is heralded. One of the photos shows a model submarine in an experimental tank, showing the hydrophone in the tank, while the man with the receivers listens to the sounds from the propeller which warn of the approaching submarine.

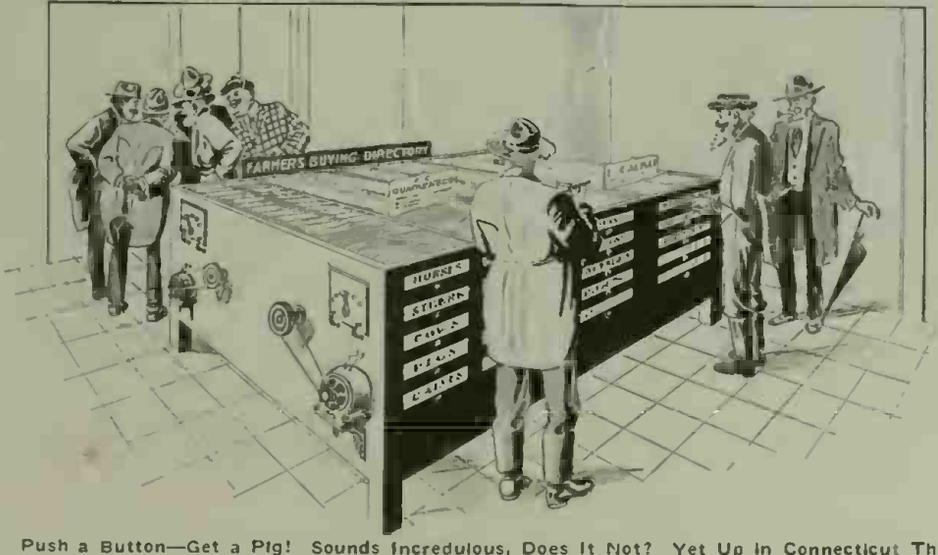
Practically all of the British ships were equipt with the device, and it is acknowledged that many ships were saved by means of the instrument, which is somewhat like a dictagraph, i.e., a super-sensitive telephone transmitter connected with a low resistance telephone receiver. The sound detecting microphone is placed in a submerged part of the hull.

Electric Violin-Virtuoso a Marvel

One of the most wonderful musical instruments ever perfected is the electrically played violin-virtuoso shown herewith. Musicians said it could never be done—but it has been accomplisht at last, with a range of action almost, if not, indeed, actually, miraculous.

The control of both speed and pressure of the bows of the self playing violin is said to be perfect. Regardless of how fast or slow the tempo the proper ratio of pressure is consistently maintained. This is accomplished by means of a small electric motor possessing a speed of from 200 to 6,000 (and any intermediate rate) revolutions per minute, and so constructed that the amount of pressure applied to the bows is automatically and accurately regulated by the speed. Thus even the softest notes are clear and sweet, while the loud are rich and sonorous. Furthermore, one by one, there has been added to the Violano-Virtuoso various devices for producing not only the staccato, but the arpeggio, portamento, pizzicato, shake, trill and all other musical variants peculiar to violin playing.

The Electrically Played Violin Is Truly a Wonder of Modern Science—It Was Long Predicted That Such a Device Could Not Be Built. But It Has—and Sixty Magnetically Operated Fingers Do the Work—and Play Better Than Most Human Violinists. Four Magnets Operate the Bows.



Sixty "fingers" perform the action. As the contact cylinder carrying the paper (fed by a secondary cylinder) revolves, and the perforations in the music roll pass given points, contact is made with one or more of the brushes and an electric current flows to finger magnets resting over the finger board. Each of these magnets attracts an armature connected with a finger operating rod acting upon the violin strings. The same current also acts simultaneously on the bow action magnets. Another magnet produces the "staccato" while the tremolo

Push a Button--Get a Pig

The Federal Agricultural Agent up in Litchfield, Conn., being frequently called upon to help farmers find things they needed and having no definite means of knowing where they were to be had except for gossip heard on his rounds, conceived the idea of an agricultural survey. Now, if you want to locate a supply of seed corn or oats, a grain binder, a pure-bred bull, or some young pigs, in any community in five counties in that State, all you have to do is to walk into the office of the State Librarian at Hartford, run a series of cards thru an electric sorting machine, and, Presto! you have the information.

It may sound a little like the story of Aladdin's lamp, but it is only big business applied to farm affairs under war stress. The Council of Defense took up this plan and offered to back the farm bureaus to the limit in every county in the State. Five of the eight counties began surveys early in March, 1918. Forty questions, under the headings of area, crops harvested in 1917, crops planted to be harvested in 1918, live stock on hand, machinery on hand, and employes, were included in the survey, and a corps of volunteer farmer census enumerators got busy. When the survey was completed the farm bureaus had a stack of cards containing minute information as to the resources and needs of every farm. An electric sorting machine was installed in the State Library, and any fact disclosed by the survey can be made available by throwing on an electric switch. The survey has been invaluable by helping Connecticut to mobilize her agricultural forces for peace needs.

Push a Button—Get a Pig! Sounds Incredulous, Does It Not? Yet Up In Connecticut They Have Such an Electric System In Operation. You Don't Exactly Get the Pig Or Cow by Pushing the Button, But You Do Obtain Data as to Where You Can Buy Them.

Putting It Over on Fritz

By K. K. SAMMERIN

Tricks and Odd Slants of Warfare that Puzzled the Hun

THE immediate ancestor of the "Mills" hand grenade was the "jam tin." This was an awkward and unreliable species of bomb, shaped like a canned soup receptable, with a six- or eight-inch projecting fuse intended to burn four seconds. Sometimes it fulfilled expectations exactly, but more often the fuse was temperamental. It went off before the time was up, or sputtered long enough, after dropping in the German trench, to allow one of the enemy to pick it up and toss it back. Because, early in the fall of 1915 when this crude weapon flourished, bombs of any kind were so scarce that the soldiers often made their own, few opportunities for dosing the enemy with his own pills were overlooked.

The last day upon which Fritz monkeyed with "fizzers" from the Allied trenches with any degree of self-confidence was November 12th, 1915. That occasion taught him that even a "dud" jam tin has its lively moments.

For several weeks preceding the date mentioned a French ordnance engineer had been experimenting with what he termed "instantaneous fuse." This was made up, wound in waxed thread, just like the ordinary fuse used in jam tins. The essential and important difference between the two varieties lay in the fact that while straight fuse fizzed off at the rate of *one and one-half inches a second*, the instantaneous variety burned *twenty-six feet a second!*

Without giving the fact much publicity, several thousand jam tins identical in appearance with the stock variety were made up. In every way but one these were the same; the six-inch fuse was instantaneous, and was made with the end charred a trifle, to look as if the bomb had been lighted and had gone "dud" after being thrown.

Over a sixty-kilometer front in the Verdun sector the bombers were assembled and coached in the use of this new weapon. Simultaneously at seven in the evening "parties" started out for the German wire. Stopping here, each of the four hundred bombers participating delivered himself of four regular "jam tin" grenades and four of the "imitations" before scurrying back.

Fritz noted one striking feature of the engagement. Many of the Allied missiles landed "dud"; this probably was due to the extraordinary *inefficiency* of the French ordnance department, concerning which the German privates had been told so much. All along the line German defenders picked up the imitation duds and lighted their fuses, intending to bomb the bombers with French ammunition.

The havoc that resulted was appalling! Each grenade, of course, exploded the instant it was lighted. Because a raid was in progress, anyway, each individual accident received no attention at the moment. If Fritz saw Heiney go up in smoke while handling a French bomb, he thought simply that Heiney had been too careless—tough luck for Heiney, but *he* would never get caught that way. A second later another trick bomb would send him to join his Hun Comrade.

For several minutes after the bombers reached their sheltered trench the explosions continued across No Man's Land. It was estimated at the time that a full thousand of the grenades exploded in the hands of German soldiers before anyone found out the secret. Since the average bomb exploding in the confined lane of a trench will kill three and wound six soldiers, it is fairly safe to assume that this simple trick cost the Germans at least *five thousand men in killed and wounded!* From that day forward it was official practise in the German lines to let French bombs severely alone.

Another point at which Allied wits bested German scheming was at forecasting retreats by the enemy. To civilians, well-posted with data on the occasional exploits of airplane observers, this does not sound sensational in the least, but doubtless to the Huns themselves the manner in which the Allied forces knew of the last retreat in the Soissons-Reims sector in time to take full advantage of it seemed little less than miraculous. No matter what airmen may say about the photographs they took, or the observations made by telescope from a 'plane, this latter scheme could only tell of a retreat actually under way—too late for much action by the Allies. On the other hand, the method described here not only would tell for certain, two weeks in advance of the first troop or supply train movement, *but would mark off the exact line to be abandoned, and tell the depth to which the Germans intended to relinquish their hold!*

This was done simply by listening in on the unintelligible gibberish of German trench wireless with Allied instruments. Ordinarily, of course, three-fourths of the signaling done in the front trenches is done by means of telephone, orders being sent thru one central station by wire to all parts of the sector.

Towards the end of the war, however, the Germans began to run out of wire and telephone instruments. They could not replace them because of a lack of the materials. Therefore they began to plan on saving every instrument and foot of wire when a retreat was to be made. They took out the stations gradually, and as they removed them they set up trench wireless instead. The Allies, after finding out this plan, simply watched the appearance of wireless sets where 'phone stations had been; when the wireless began to predominate it was certain that ten days or two weeks would

Cold Light

By ROGERS D. RUSK, M. A.

COLD light is one of the wonders of the modern age. Light without heat seems like a contradiction, nevertheless it is a scientific fact. Since the discovery of the electrical

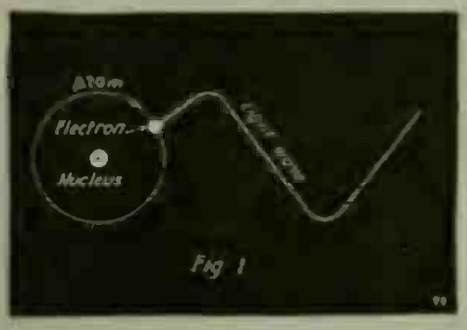

Diagram Illustrating the Old Theory of Light Produced by Electricity. In This Explanation the Electron is Considered as Continuously Producing Light Waves by its Rotation. The Newer Theory of Light and Heat Waves is Shown at Fig. 2.

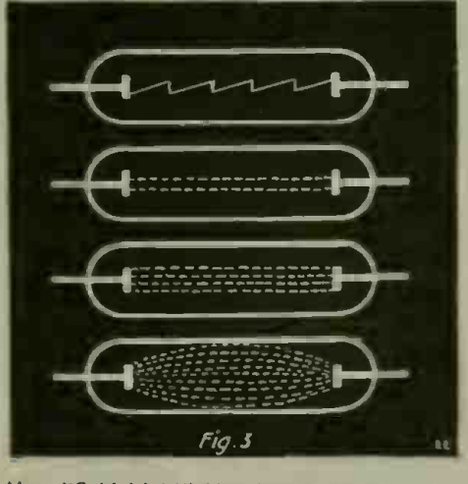
nature of light, the possibility of transforming electricity directly into light, without the production of heat, has been a tempting goal. For centuries, scientists dreamed of solving the mystery of the *firefly* and the *Aurora Borealis*, but dreamed in vain. They saw light without heat produced in Nature, but could not produce it themselves.

Today the discovery that light may be produced without heat, by means of electrical ionization, seems to be the key to the situation, and we can only wonder where it may lead us. At the present time over 96 per cent of all the energy used in the fifty million incandescent lamps in the United States, instead of being turned into light, *is wasted in the form of heat!* Moreover the astonishing production of light without heat by ionization has given us a new view of the relation between light and electricity and the great problem of the origin of light.

It used to be thought that light could only be produced by incandescence, that is, thru heating of a solid body to white heat. Strange as it may seem, the candle and the kerosene lamp are really incandescent lights. The light they give off is due to white-hot particles of carbon liberated in the combustion process. Even the light from an arc lamp is mainly due to the crater in the positive carbon being heated to incandescence.

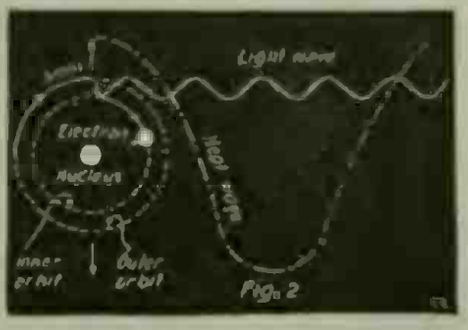
The fact that heat is not the only factor which effects the production of light can be easily seen in two ways. First, salts of sodium, potassium and lithium may be thrown in the same flame at exactly the same temperature, but the first gives off a bright yellow light, the second a violet, and the third a deep red. Second, light is produced by an electric spark in a partial vacuum, such as a Geissler tube, *with little or no heat at all.* In both of these cases the light *must* be produced by the breaking up of the molecules, of the solid or gas, into electrically charged particles, or ions, in a manner to be explained later.



The idea of using cold light for illuminating purposes seems to have first occurred to Nikola Tesla. Very early in his career he suggested that the effects produced in Geissler tubes might be utilized in that way. Not until recent years, however, did his suggestion bear fruit in the shape of the now famous Moore *vacuum tube* light, invented by McFarland Moore, which produces a fine soft light from a glass tube thirty to forty feet long, filled with carbon dioxid. The heat which this light produces is almost negligible.

Cold light is a term used to indicate luminous radiation *without* heat radiation, and that means maximum efficiency, i.e., a colder and a colder source. The old fashioned kerosene lamp wastes 36.4 calories of heat per second for every candle-power of light produced. The gas mantle wastes 11, and the tungsten lamp but from 1. to 2. calories.

Considering electric lights only, the heat loss in tungsten lamps has been reduced by the introduction of gases such as nitrogen into the bulb, but arc lights have made a greater development. The invention of the enclosed arc reduced the heat loss without reducing the illumination. Then the invention of the flaming arc increased the illumination without increasing the temperature of the arc. The latter is the most interesting development because part of the light from the flaming arc is *cold light*, from the chemicals in the flame which are ionized by the electric current. The cold light from these ions plus the light from the incandescent carbons makes the flaming arc nearly *three hundred per cent* more efficient than the ordinary incandescent lamp.



The first flaming arc appeared in 1900, known as the Bremer arc, and using carbons impregnated with several chemical salts. Later Steinmetz and Whitney used the rare metals titanium and chromium in their arcs and produced a still more efficient light. About the same time the *mercury vapor* light was invented, which gave a brilliant bluish white light from the mercury ions in the arc. Later still is the discovery by two scientists, Franck and Hertz, that an electric current of only 4 volts, when past thru *cold iodin vapor*, produces a faint light of definite color. When the voltage is raised to twelve, another color is obtained. This is *true cold light*, produced directly from the molecules as they are ionized by the current. How this is possible, and how light and heat may be produced independently of each other, will now be shown.

What the actual source of a light wave is has been one of the mysteries of science since the beginning of history. The discovery by Maxwell, Hertz and others that light is an electro-magnetic vibration, caused scientists to look for the electric charges which produce these waves. When the electron was discovered it was thought that the solution had been found, but there

How "Cold Light" May be Obtained by Exhausting an Ordinary Glass Tube. When Air is Pumped Out of a Tube in Which There is an Electric Spark Discharge, a Stage is Reached Where the Whole Tube is Filled with a Soft Luminous glow—Cold Light.

was still one great drawback. Scientists said that as the electron revolved about its axis in the molecule it produced light waves just like a paddle wheel in a body of water. But as all molecules of all substances con-

The New Theory of Light and Heat Waves, Which Says that Light is Produced Intermittently. Here Light is Produced by the Electron Jumping from One Orbit to Another, as the Circular Orbital Paths Indicate.

tain electrons which are constantly in motion, then all substances should give off light all the time. This was ridiculous, as everything in the world and the whole universe would be of a dazzling brightness like the sun.

The discoveries of today are changing this idea completely. One of the world's greatest physicists, Planck, says electrons cannot give off light waves continuously, but emit definite quantities at intervals. This theory he calls the *quanta theory*, and another physicist, Bohr, says the time the light is given off is when the motion of the electron is suddenly changed from its normal continuous motion, by its jumping from one atom to another, or from one orbit to another about the same atom. This is a very simple theory, but it is often the simplest theory which best explains the facts. When trillions of trillions of electrons are doing this at the same time, the light is to all purposes continuous. These theories have received added confirmation from work done recently by Prof. Millikan of Chicago University, who gained fame by his original measurements of the electron itself.

The principle of the new theory can be easily explained by an illustration. If a ball is whirled in a circle on the end of a string, the pull on the string is steady and continuous as long as the ball whirls with the same speed. However, if the ball is suddenly stopt or hit by something which makes it change its course, a jerk or a wave will be felt in the string. Now an electron does the same thing, only the jerk or wave is sent out in all directions by the electro-magnetic field about the electron. This jerk or wave is the little quantity which Planck calls a "quanta". The familiar way in which an electron is pictured as continuously producing light waves, by its rotation, is shown in Fig. 1, but this is wrong according to the above theory. What really must happen is shown in Fig. 2, where the two circles represent different orbits and the full line represents the path of the electron jumping from one orbit to another and at the same time emitting a quantity of radiation or *light*. The way in which electricity or some other agency causes this disturbance of the electron is not fully understood.

The most remarkable thing about it all is that heat and light waves may be produced independently. A heat wave is produced by the vibration of the whole molecule or atom as shown by the big arrows and dotted wave line in Fig. 2. And under

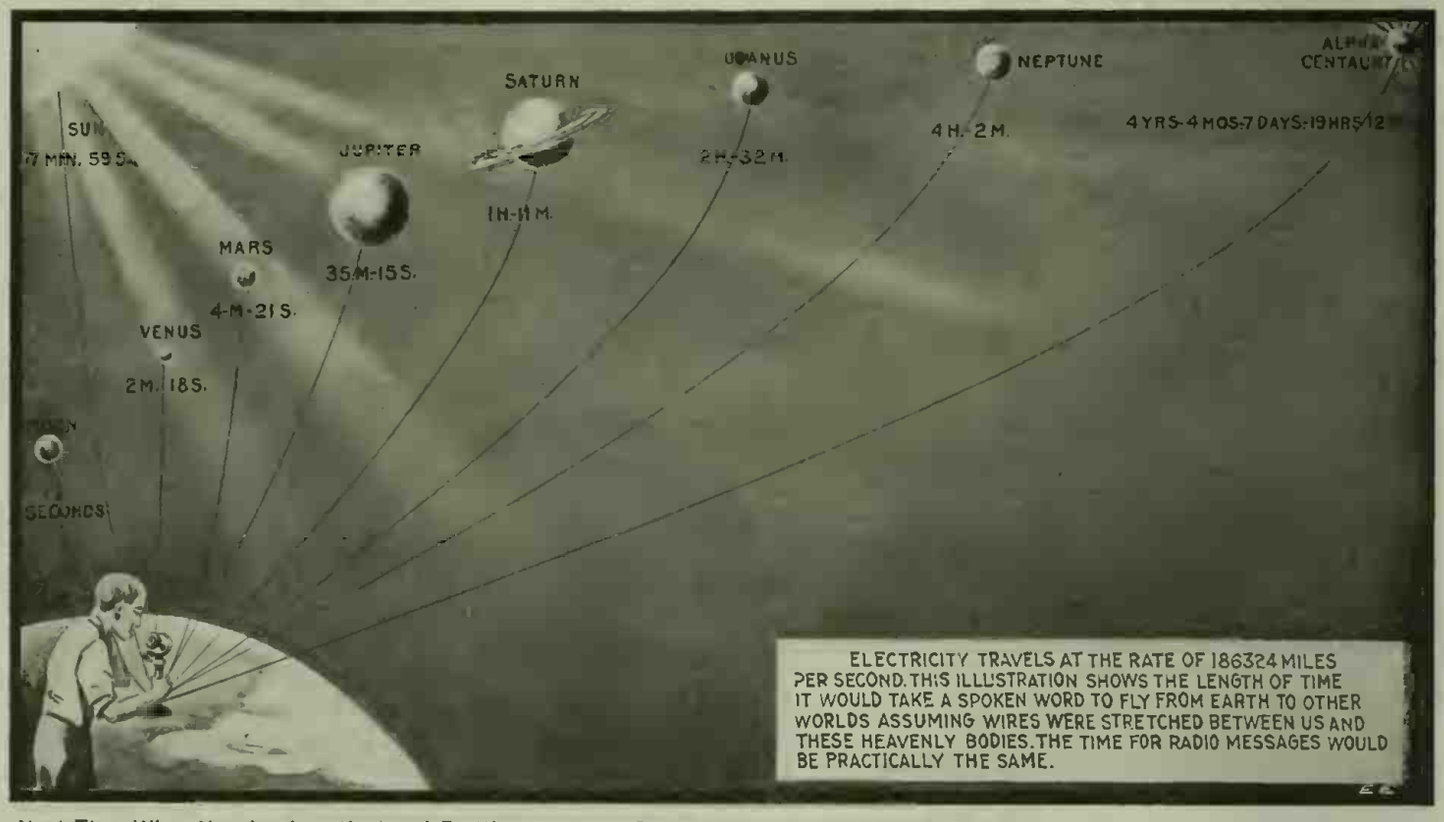
Popular Astronomy

Astronomical Distances

By ISABEL M. LEWIS
of the U. S. Naval Observatory

THE immensity and grandeur of the scale upon which the visible universe is fashioned lies almost beyond human comprehension. To visualize the vast extent of our own solar system which is but a single unit in the system of the stars we may have recourse to earthly standards of measurements, such as the mile. But when we desire to express in terms of units that can be grasped by our imagination, the distances of the stars that lie far, far beyond, we find that all ordinary standards of measurement become utterly inadequate for our purpose. For the measurement of celestial distances *within* the solar system the unit employed is either the familiar mile or kilometer or the "astronomical unit," which is the mean distance from the earth to the sun (ninety-two million nine hundred thousand miles in round numbers).

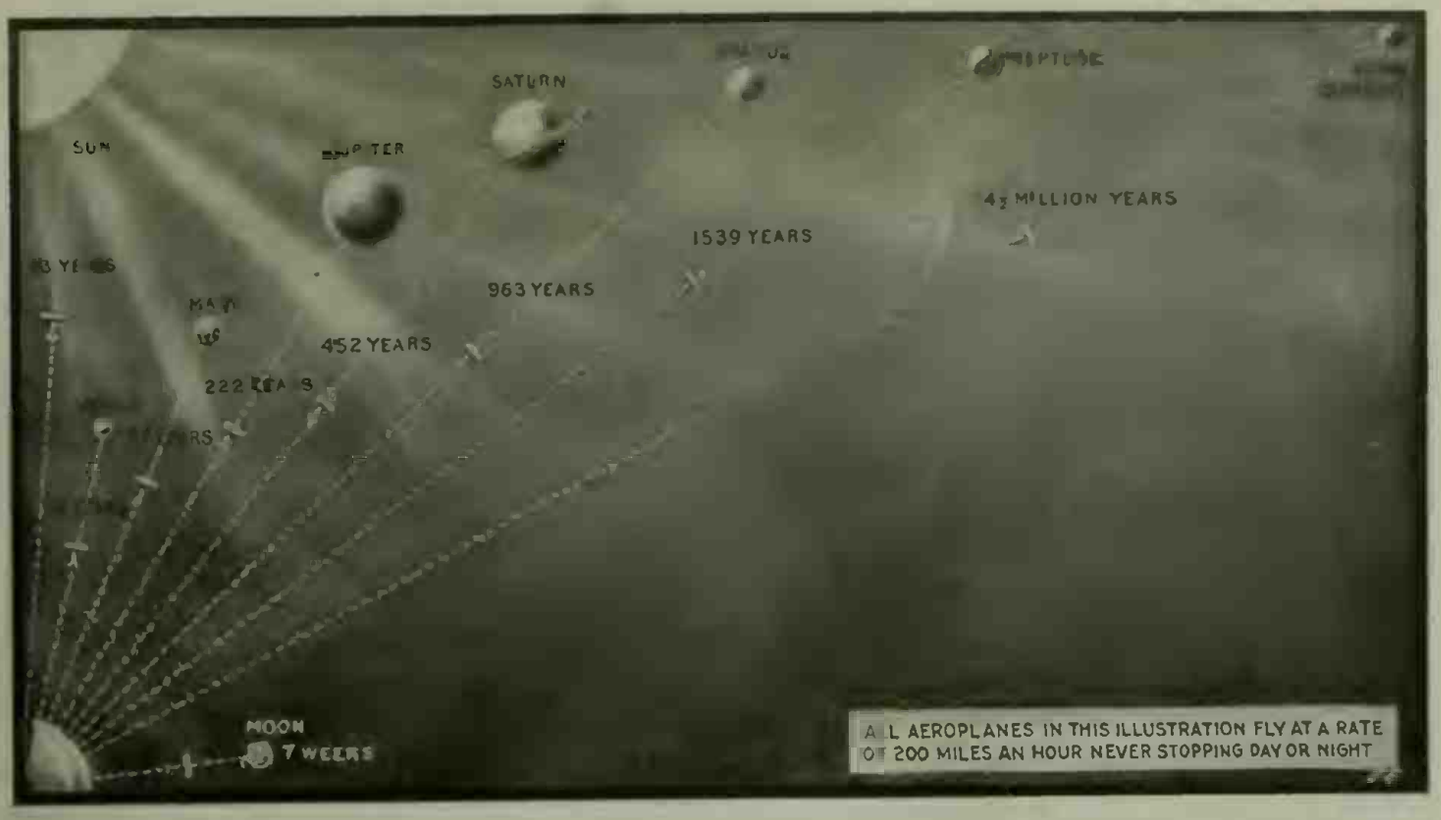
The unit of measurement employed for distances *beyond* the solar system is either the *light year* or more recently the *parsec* which appears to be rapidly replacing the light year among astronomers. A "light year" is the distance that light, with its finite but almost unimaginable velocity of one hundred and eighty-six thousand miles *per second, travels in a year.* It is equal in round numbers to sixty-three thousand times the distance from the earth to the sun or approximately six thousand billions of miles. The parsec is equal to three and twenty-six hundredths (3.26) light years, and it is approximately two hundred thousand times the distance from the earth to the sun. It is "the distance of a star with the *parallax* of a second," a fact which its name conveys to us. In other words, at the distance of one parsec the distance from the earth to the sun, "the astronomical unit," would subtend an angle equal to one second of arc. This angle is spoken of as the parallax of the star. The larger the parallax; that is, the larger the angle that the astronomical unit or radius of the earth's orbit subtends, viewed from the star, the nearer the star is to us. The fact that there is no known star within one parsec, or three and twenty-six hundredths light years, of the sun shows the immensity of the scale of the universe of stars.



Before considering the distances of the stars and the extent of the sidereal system of which our sun and his satellites form a part, let us undertake to express the distance of the sun, moon and planets from the earth and the extent of the solar system in terms with which we are familiar.

The nearest to the earth of all celestial bodies is its satellite, the moon. So near is the moon that if we should make on some great plain a model of the solar system in which the astronomical unit, the distance from earth to sun, would be four hundred feet, the distance between earth and moon would be only one foot. On the same scale the most distant planet Neptune would be two and one-quarter miles away. In round numbers the moon is distant from us sixty times the distance from the earth's center to its surface or two hundred and forty thousand miles and thru our great telescopes we see it as it would appear at a distance of one hundred miles.

Granted that it were possible to escape the earth's gravitational bonds and to travel by our swiftest means of conveyance, the airplane, thru interplanetary space, let us consider how long it would take us to reach the moon, sun and planets if our speed were unslackened at two hundred miles an hour. An airplane traveling at this rate would circumnavigate the earth in a little over five days and would reach the moon in seven weeks. A trip to the sun, however, would require fifty-three years.



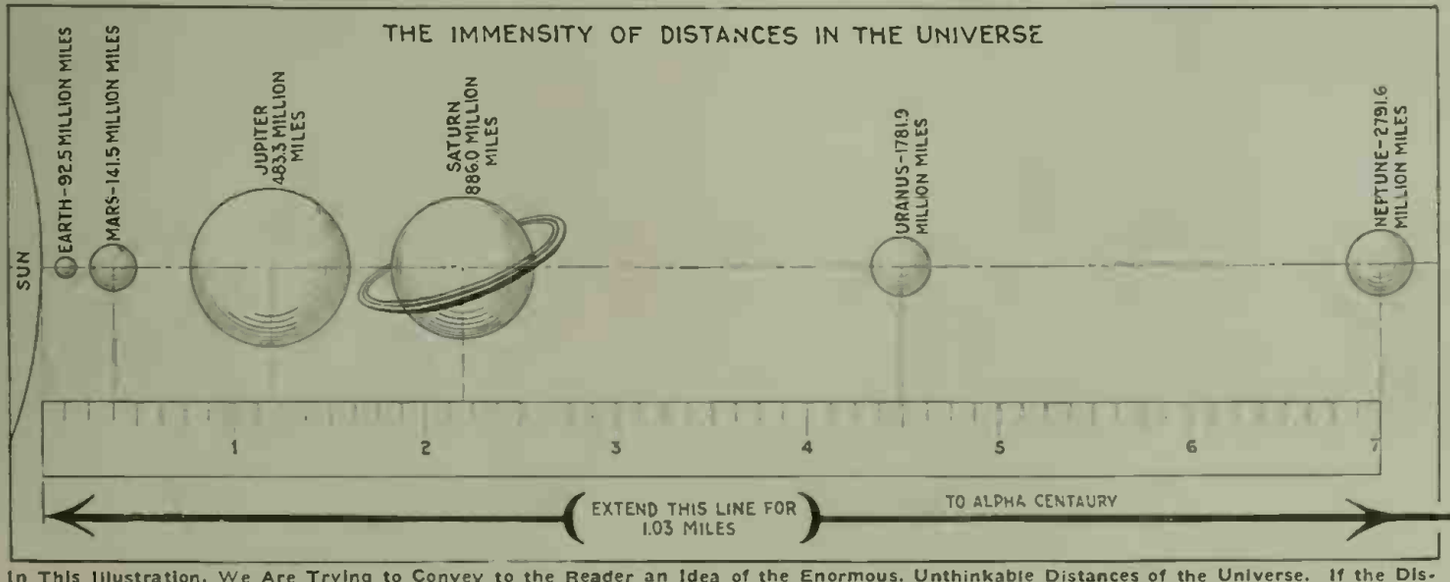
After traveling for fourteen and a fraction years we would pass the orbit of Venus and eighteen years later the orbit of Mercury. If we preferred to travel outward from the earth in the direction of Mars and the outer planets instead of toward the sun, more than twenty-seven years would elapse before the orbit of Mars would be crost. An airplane journey to Jupiter would be a matter of more than two hundred years, to Saturn four hundred and fifty years, to Uranus nearly one thousand years and to Neptune about one thousand five hundred years. To cross the solar system on the diameter of Neptune's orbit would be a journey of more than three thousand years. The sun's attraction reaches far beyond Neptune's orbit, however. There are comets belonging to the solar system compelled by the sun's attraction to accompany him on his travels thru space that return periodically to the immediate vicinity of the sun from regions far beyond the orbit of Neptune and there is also the possibility that one or more undiscovered planets may travel around the sun in orbits exterior to Neptune's orbit.

Measured in terms of familiar units, such as are employed for the measurement of distances on our own planet, the extent of the solar system is tremendously great. Seen from Neptune, the sun presents no appreciable disk. It is in this sense starlike to the Neptunians, but seen from Neptune the stars appear no more brilliant and

Next Time When You Are Impatient and Fretting Because "Central" Keeps You Waiting Ten Seconds for a Connection, Imagine That Your Best Girl Is on Neptune. You say "Hello" and It Takes Exactly 4 Hours and 2 Minutes for "Hello" to Get Up to Neptune, and Then You Have to Wait 4 Hours More to Give Your Sweetheart a Chance to Say "Hello" in Return. While If She Were on Alpha Centauri, It Would Take Your Voice Over Four Years to Get to Her and an Equal Time for Her Voice to Get Back, Altho You Know That Electricity Travels at the Rate of 186,324 Miles a Second.

www.americanradiohistory.com

The Fastest Vehicle Known to Man is the Airplane. Supposing There Was Air Instead of a Vacuum Between the Earth and the Other Heavenly Bodies, It Would Take an Airplane a Very Considerable Time to Reach These Bodies. Even to the Moon, the Nearest of All Heavenly Bodies, Only 236,000 Miles Distant, Seven Weeks Would Be Consumed in Reaching It By Airplane. To Reach Neptune, It Would Take 1359 Years. Such Are the Immense Distances of the Universe.



therefore no nearer than they do to us.

To Neptune the sun, tho star-like in form, supplies a very appreciable quantity of light and heat (one nine hundredth of the amount the earth receives) while the amount of light and heat that Neptune receives from the nearest stars is entirely inappreciable. When our airplane reaches Neptune after a journey of one thousand five hundred years, it is, as it were, just clearing the ground for its flight to the stars. To cover the intervening space to the nearest star, traveled by light in four and a third years, an airplane would require *fourteen and a half million years*. In that time the solar system itself would be in some far distant part of the universe, for it is speeding onward thru space at the rate of twelve miles a second or about four astronomical units a year.

Changing now our unit of measurement that we may express interstellar distances in comprehensible numbers, we prepare to travel from the earth to the stars with the velocity of light.

At this speed, one hundred and eighty-six thousand miles per second, we circumnavigate our globe in one-seventh of a second, reach the moon in one and a fourth seconds and the sun in eight minutes. In a little over four hours we pass the orbit of Neptune and are started on our journey to the stars penetrating further and further into interstellar space. For a year we travel and reach not a single star tho we are speeding ever onward with the velocity of light. We have now covered the distance of one light year which means the waves of light from the sun we have left behind must travel for a year before they reach us. We continue our journey and find ourselves next at a distance of one parsec from the sun. We have traveled a distance of approximately three and a quarter light years, and were it possible to see the earth as well as the sun at this distance, the two would appear to be but one second of arc apart, a distance that requires the most careful adjustment and manipulation of the telescope to measure accurately. We are still one light year distant from Alpha Centauri, the nearest of the bright stars. A few of the stars may now appear somewhat brighter than they appear to us on earth, but the majority of the stars appear just as we see them here on earth and the forms of the constellations remain practically unchanged in appearance, for we are only beginning our journey thru the sidereal universe and our position in the universe has only shifted in a slight degree. If we should continue our journey to the immediate vicinity of Alpha Centauri, we would find that it is not like our own sun, a single star, but is a binary star consisting of two suns in revolution around their common center of gravity. The distance of this binary system from the solar system has been meas-

(*Continued on page* 54)

In This Illustration, We Are Trying to Convey to the Reader an Idea of the Enormous, Unthinkable Distances of the Universe. If the Distance from the Sun to Neptune, Which in Reality Is 2,791 Million Miles, is Represented By Seven Inches On This Scale, Then the Distance from the Sun to the Nearest Star, Alpha Centauri, Would Be Slightly Over One Mile. Note How Near the Earth Is to the Sun, Altho 92 Million Miles Away from It. In Order to Show the Earth Without It Touching the Sun, It Was Necessary In This Drawing to Make the Earth Smaller Than Mars. In Reality Mars Is Smaller Than the Earth. The Other Planets Are Shown in Their Correct Proportions.

Reclaiming Metal Dust From Flue Gases

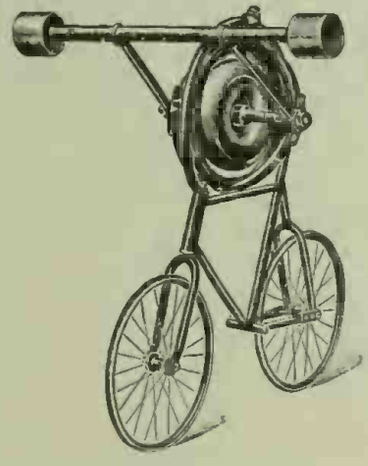
IN refineries of different types there is always a possibility of some valuable by-products, waste, etc., being lost by gases ascending the flue. This is particularly true in the metal treating field. Here it has been found possible to save solid and liquid particles from the flue gases by an electrical process. This consists in passing the gases thru tubes in which are suspended insulated chains charged with high voltage direct current. In passing thru the tube the particles carried by the gases become electrified and are projected against the walls to the tubes. These tubes are grounded and thus the particles drop into hoppers below. Mechanical rectifiers convert the low voltage alternating current into direct current.

An interesting application of this process was recently made in a copper refinery. In this particular installation there is another noteworthy fact and that is the size of the generating and transforming unit used.

The treater tubes containing the high tension electrodes and thru which the flu gases pass are arranged in six groups. The electrodes are suspended at the top from a rack which provides ample insulation, and are connected with the high tension direct-current line at the bottom. The gases from the furnaces pass thru pipes 13 feet in diameter, a "Y" with valves being provided so that the gases can be made to go either thru the treater or directly to the stack as desired. See figure herewith.

It is stated that over 90 per cent of the flue dust can be removed and that the value of the copper, zinc and other metals recovered will within a short time pay for the treating equipment.

This Power Plant Delivers 100,000 Volts and .5 Ampere, Direct Current, for Precipitating the Solid Particles in Flue Gases, Such as in the Metal Refining Field, Thus Saving as Much as 90 Per Cent of the Flue Dust.



Interior of High Tension, Direct Current, Electrode Chamber Inside of Flue Tube Measuring 13 Feet in Diameter. The Electrodes Are Suspended Chains Which Carry the Charge When in Use.

The transformers are of 40 kva. capacity, 200 volts low tension and 100,000 volts high tension. To the motor-generator shafts are coupled the commutating rectifiers for transforming the high-tension alternating current into direct current.

A Gyrostatic Bicycle

The accompanying illustration shows a novel gyrostatic bicycle model built by a London scientific instrument maker, and this machine will maintain its equilibrium for a considerable period of time. Many of us most probably have seen the street fakir shouting loud and longly about the wonderful possibilities of the toy gyroscope,

The Gyrostatic Bicycle Is Used Extensively in School Laboratories to Demonstrate the Wonderful Stabilizing Power of the Gyroscope.

and the apparatus here shown duplicates the many startling maneuvers that the little twenty-five-cent toy gyro performs. When a gyroscope balance wheel is spun rapidly, and providing the rim of the wheel is sufficiently heavy to give it a good momentum, it will be found very difficult to shift the bicycle, or other device on which the spinning gyro is mounted. To demonstrate the principle of the gyroscope—which is based upon the fact that a spinning or rotating mass tends to preserve its plane of rotation—all one has to do is to jack up the rear wheel of a bicycle, and by turning the pedals, cause this wheel to spin rapidly. Now hold the bicycle off the ground a short distance, and endeavor to turn the complete bicycle sidewise. You will experience a surprisingly strong counter-turning effect, which tends to keep the bicycle in its upright plane as long as the wheel spins at a fair rate of speed. Many of these gyros are electrically driven; also it is well to keep in mind the fact that even an ordinary bicycle exerts some gyrostatic effort, and this has much to do with the success of the rider in maintaing his upright position while spinning along on two wheels mounted in tandem, that is, one behind the other. You have prohably noticed, if you have ever ridden a bicycle that the faster you go, the easier it is to maintain your balance. The increasing gyrostatic effect as the rotational speed of the wheels increased was the reason.

A HARD DRINKER OF SOFT DRINKS.

This little girl is a soft drink demonstrator and she sits in show windows all day long pouring drink after drink of some delicious beverage into the glass and raising it to her lips and draining it with the greatest ease.

She seems to like the beverage, for after each drink she nods her head a couple of times with a happy smile which seems to say, "My, that was good"; then she pours down another one.

The figure is made life size of papier maché and mounted on a tabourette, which contains the electric motor and speed reducing mechanism. The cams and levers which operate the arms and head are thoroly concealed inside the body.

Drink Hearty, Little Girl. It's Only Some of Willie Bryan's Famous Grape Juice. An Electric Motor Solves the Mystery of This Silent and Ever-Drinking Demonstrator.

Try These On Your Auto

ELECTRIC CIGAR LIGHTER FOR THE AUTO

At last—a perfect electric cigar lighter. It should prove a boon to motorists. It is handy and convenient—always within reach. The burner tip is made of heavy wire and will last indefinitely. Burner tip is protected by a cap not shown in cut. This neat and efficient cigar lighter is equipt with 5½ foot cord, which automatically rewinds. The lighter is easily attached to the battery in the car and costs practically nothing to operate.

Ever Try to Light a Cigar While Driving an Auto? This Electric Cigar Lighter Does the Trick Better Than Matches and Does Not "Blow Out".

NEW MAGNETO IMPULSE STARTER.

One of the many reasons why the magneto is so firmly established as the supreme ignition system is the fact that it does not depend upon any other unit or units for its electrical output and distribution of current.

The magneto transforms mechanical energy into electrical energy. The moment the shaft of a magneto-equipt engine revolves, the magneto begins to generate electrical energy for ignition; and, following requirements, the higher the rate at which it is driven the more intense are the sparks.

To facilitate *starting* when necessary, the magneto here shown can be supplied, with an impulse starter, which automatically "speeds up" the magneto armature at the exact moment of firing the *initial* gas charge or charges, thus providing at even low speeds the full electrical capacity of the magneto.

In a word, the impulse starter or coupling is a mechanical device for the purpose of obtaining positive and efficient starting, without the aid of batteries or a battery system of ignition.

The impulse starter is located between the magneto drive and the armature; when the engine is cranked or barred over, the armature is held stationary, while energy is being stored up by the compression of a series of springs. At a predetermined moment the springs are released and the armature is given a partial revolution at high speed. In this way, intense sparks are provided, and the engine given its starting impulse.

As soon as the engine commences its regular operation, or attains a speed of about 120 r.p.m., the impulse starter is automatically disengaged, the "starter" transmitting the driving energy to the magneto as a flexible coupling.

The control of the "starter" is by means of a lever mounted on a shaft projecting from the front of the housing. The lever is so constructed that it can either be operated by hand or thru the medium of a control connection.

The impulse starter is not an attachment, but is provided only as a part of this new magneto.

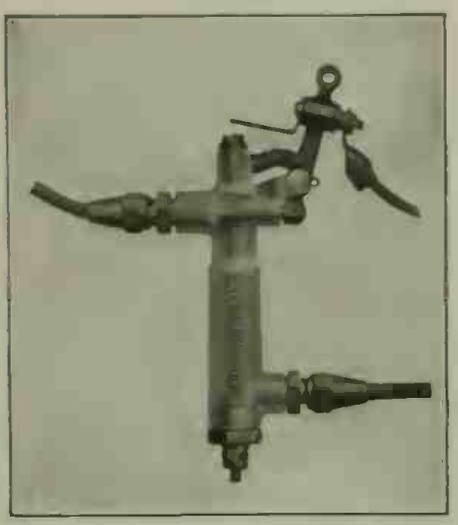
By Storing Up Energy In a Special Spring Coupling Device, It Becomes Possible to Spin This Magneto at Starting, and Provide a Hot Spark.

HEADLIGHT DIMMER

An Ohio electric concern is offering the public a device known as a headlight dimmer for use on Ford cars to dim the headlights when driving at night. This dimmer, it is claimed by the maker, can be attached to any Ford car by simply clamping it over the steering post and connecting the wires to the lighting circuit. The wires are easily connected, and when in use it is said that the dimmer will not affect the ignition or lighting system in a detrimental way. The control is made possible by means of a push and pull switch and a barrel type resistance. It is pointed out that it makes possible the use of a brighter light than can be secured thru the use of dimming lenses, yet at the same times makes it convenient to dim the lights according to requirements of traffic laws.

Here Is a Simple Electric Headlight Dimmer, Something Every Car Requires by Law. It Answers to the Call of Fords.

EFFECTIVE AUTO SIGNAL.



In this new electric auto signal there is only one *signal box*, which is placed on the left rear fender (or body or panel in the case of commercial vehicles and trucks). This shows both from the front and rear, and is visible day and night. The left rear fender is the logical place for the signal, as it is seen by all cars following from the rear, or cars approaching from the front, as well as by the traffic policeman, who is always to the left of cars approaching him.

A Logical Design In Electric Auto Signals, Which Can Be Seen from Front or Rear. It Is Controlled from the Driver's Seat by Means of a 3-Way Switch.

The signal is controlled for *left*, *right*, or *stop* by a plainly marked, single handle, three-way switch attached to the steering column immediately below the steering wheel, or in a place most accessible to the person driving. It is easily attached, and there are no moving parts to get out of order. A tell-tale buzzer indicates that the signal is functioning. A very slight amount of current from the lighting system of the car or dry cells is consumed. The signal is easily installed on the car by any mechanic.

ELECTRICALLY HEATED PRIMER FOR QUICK STARTING OF AUTOS.

This Electrically Heated Primer Will Save Much Useless Cussing and Start Your Auto Engine In a Jiffy. The Fuel Is Heated, Mixed With Air and Vaporized. Then Sucked Into the Engine. A Simple and Positive Device.

The autoist usually thinks of a primer as a means of pumping fuel into the cylinders quickly. The master primer here shown is not a pump in any sense of the word. The fuel is first heated boiling hot, vaporized by heat and mixed with air. Then drawn into the cylinders by suction of the motor. The suction draws only the quantity needed. Liquid gasoline will not explode. It must be vaporized. It must have air mixed with it to make it explosive.

Liquid fuel in large quantities carbonizes the engine. With the throttle of the carburetor closed, the master primer acts as an auxiliary carburetor—supplies the motor with what it needs in any kind of weather—heated vapor. The heating coil draws 20 amperes, about the same as the horn. Without it you may turn a balky engine over a hundred times.

To operate the primer all one need do is just pull a button on the dash. The same operation as choking the carburetor. Pulling the button makes electrical contact and opens the outlet valve of the primer. When car starts let go of button; the contact is broken and valve shuts off automatically.

NEW MAGNETIZER FOR REMAGNETIZING FORD MAGNETOS.

The Ford engine will display a great deal more "pep" if the magnets on the magneto are kept charged. We all know these magnets will lose their magnetism, which naturally reduces the energy displayed by the engine. The magnetizer is constructed in such a way that these magnets can be charged without taking the engine apart. All that is necessary is to take off the transmission cover. The magnets can then be charged, requiring only three or four seconds to each magnet. This is done by connecting the magnetizer to a well charged 6 or 12-volt battery or a sufficient number of dry cells in series.

Ford Owners Will Hail With Delight This New Magneto Magnetizer.

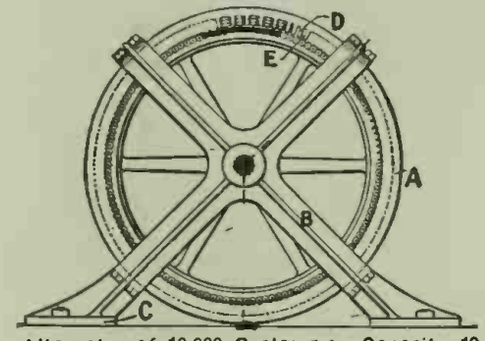
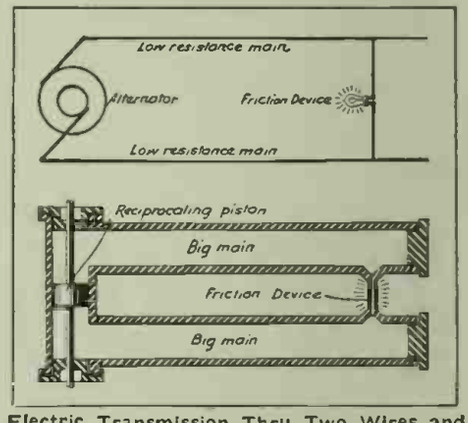
RADIO DEPARTMENT



The True Wireless

By NIKOLA TESLA

Written Exclusively for The Electrical Experimenter



EVER since the announcement of Maxwell's electro-magnetic theory scientific investigators all the world over had been bent on its experimental verification. They were convinced that it would be done and lived in an atmosphere of eager expectancy, unusually favorable to the reception of any evidence to this end. No wonder then that the publication of Dr. Heinrich Hertz's results caused a thrill as had scarcely ever been experienced before. At that time I was in the midst of pressing work in connection with the commercial introduction of my system of power transmission, but, nevertheless, caught the fire of enthusiasm and fairly burned with desire to behold the miracle with my own eyes. Accordingly, as soon as I had freed myself of these imperative duties and resumed research work in my laboratory on Grand Street, New York, I began, parallel with high frequency alternators, the construction of several forms of apparatus with the object of exploring the field opened up by Dr. Hertz. Recognizing the limitations of the devices he had employed, I concentrated my attention on the production of a powerful induction coil but made no notable progress until a happy inspiration led me to the invention of the oscillation transformer. In the latter part of 1891 I was already so far advanced in the development of this new principle that I had at my disposal means vastly superior to those of the German physicist. All my previous efforts with Rhumkorf coils had left me unconvinced, and in order to settle my doubts I went over the whole ground once more, very carefully, with these improved appliances. Similar phenomena were noted, greatly magnified in intensity, but they were susceptible of a different and more plausible explanation. I considered this so important that in 1892 I went to Bonn, Germany, to confer with Dr. Hertz in regard to my observations. He seemed disappointed to such a degree that I regretted my trip and parted from him sorrowfully. During the succeeding years I made numerous experiments with the same object, but the results were uniformly negative. In 1900, however, after I had evolved a wireless transmitter which enabled me to obtain electro-magnetic activities of many millions of horse-power, I made a last desperate attempt to prove that the disturbances emanating from the oscillator were ether vibrations akin to those of light, but met again with utter failure. For more than eighteen years I have been reading treatises, reports of scientific transactions, and articles on Hertz-wave telegraphy, to keep myself informed, but they have always imprest me like works of fiction.

Alternator of 10,000 Cycles p.s., Capacity 10 K.W., Which Was Employed by Tesla in His First Demonstrations of High Frequency Phenomena Before the American Institute of Electrical Engineers at Columbia College, May 20, 1891. Fig. 1.

The history of science shows that theories are perishable. With every new truth that is revealed we get a better understanding of Nature and our conceptions and views are modified. Dr. Hertz did not discover a new principle. He merely gave material support to a hypothesis which had been long ago formulated. It was a perfectly well-established fact that a circuit, traversed by a periodic current, emitted some kind of space waves, but we were in ignorance as to their character. He apparently gave an experimental proof that they were transversal vibrations in the ether. Most people look upon this as his great accomplishment. To my mind it seems that his immortal merit was not so much in this as in the focusing of the investigators' attention on the processes taking place in the ambient medium. The Hertz-wave theory, by its fascinating hold on the imagination, has stifled creative effort in the wireless art and retarded it for twenty-five years. But, on the other hand, it is impossible to over-estimate the beneficial effects of the powerful stimulus it has given in many directions.

As regards signaling without wires, the application of these radiations for the purpose was quite obvious. When Dr. Hertz was asked whether such a system would be of practical value, he did not think so, and he was correct in his forecast. The best that might have been expected was a method of communication similar to the heliographic and subject to the same or even greater limitations.

Electric Transmission Thru Two Wires and Hydraulic Analog. Fig. 3.

In the spring of 1891 I gave my demonstrations with a high frequency machine before the American Institute of Electrical Engineers at Columbia College, which laid the foundation to a new and far more promising departure. Altho the laws of electrical resonance were well known at that time and my lamented friend, Dr. John Hopkinson, had even indicated their specific application to an alternator in the Proceedings of the Institute of Electrical Engineers, London, Nov. 13, 1889, nothing had been done towards the practical use of this knowledge and it is probable that those experiments of mine were the first public exhibition with resonant circuits, more particularly of high frequency. While the spontaneous success of my lecture was due to spectacular features, its chief import was in showing that all kinds of devices could be operated thru a single wire without return. This was the initial step in the evolution of my wireless system. The idea presented itself to me that it might be possible, under ob-

IN this remarkable and complete story of his discovery of the "True Wireless" and the principles upon which transmission and reception, even in the present day systems, are based, Dr. Nikola Tesla shows us that he is indeed the "Father of the Wireless." To him the Hertz wave theory is a delusion; it looks sound from certain angles, but the facts tend to prove that it is hollow and empty. He convinces us that the real Hertz waves are blotted out after they have traveled but a short distance from the sender. It follows, therefore, that the measured antenna current is no indication of the effect, because only a small part of it is effective at a distance. The limited activity of pure Hertz wave transmission and reception is here clearly explained, besides showing definitely that in spite of themselves, the radio engineers of today are employing the original Tesla tuned oscillatory system. He shows by examples with different forms of aërials that the signals picked up by the instruments must actually be induced by earth currents—not etheric space waves. Tesla also disproves the "Heaviside layer" theory from his personal observations and tests.

EDITOR.

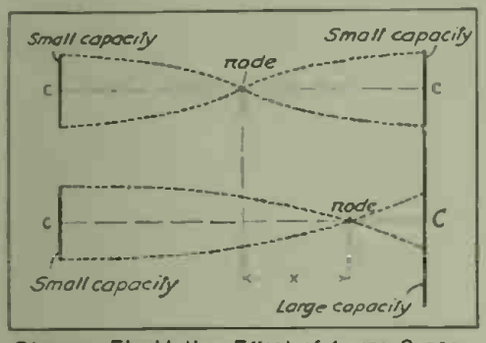
servance of proper conditions of resonance, to transmit electric energy thru the earth, thus dispensing with all artificial conductors. Anyone who might wish to examine impartially the merit of that early suggestion must not view it in the light of present day science. I only need to say that as late as 1893, when I had prepared an elaborate chapter on my wireless system, dwelling on its various instrumentalities and future prospects, Mr. Joseph Wetzler and other friends of mine emphatically protested against its publication on the ground that such idle and far-fetched speculations would injure me in the opinion of conservative business men. So it came that only a small part of what I had intended to say was embodied in my address of that year before the Franklin Institute and National Electric Light Association under the chapter "On Electrical



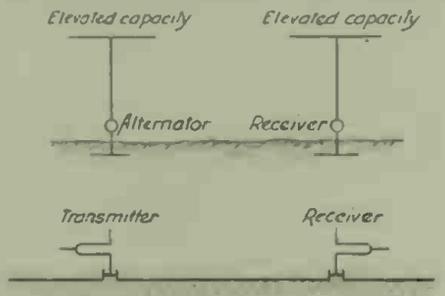


Diagram Elucidating Effect of Large Capacity on One End. Fig. 6.

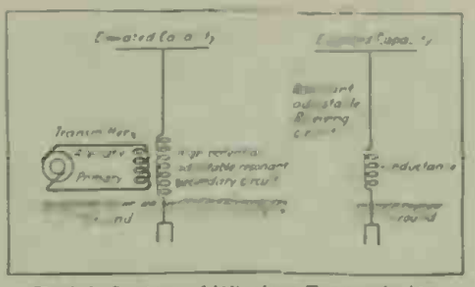
Resonance." This little salvage from the wreck has earned me the title of "Father of the Wireless" from many well-disposed fellow workers, rather than the invention of scores of appliances which have brought wireless transmission within the reach of every young amateur and which, in a time not distant, will lead to undertakings overshadowing in magnitude and importance all past achievements of the engineer.

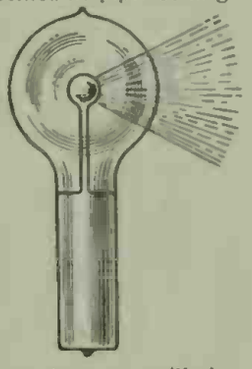


The popular impression is that my wireless work was begun in 1893, but as a matter of fact I spent the two preceding years in investigations, employing forms of apparatus, some of which were almost like those of today. It was clear to me from the very start that the successful consummation could only be brought about by a number of radical improvements. Suitable high frequency generators and electrical oscillators had first to be produced. The energy of these had to be transformed in effective transmitters and collected at a distance in proper receivers. Such a system would be manifestly circumscribed in its usefulness if all extraneous interference were not prevented and exclusiveness secured. In time, however, I recognized that devices of this kind, to be most effective and efficient, should be designed with due regard to the physical properties of this planet and the electrical conditions obtaining on the same. I will briefly touch upon the salient advances as they were made in the gradual development of the system.

Transmission of Electrical Energy Thru the Earth as Illustrated in Tesla's Lectures Before the Franklin Institute and Electric Light Association in February and March, 1893, and Mechanical Analog of the Same. Fig. 7.

The high frequency alternator employed in my first demonstrations is illustrated in Fig. 1. It comprised a field ring, with 384 pole projections and a disc armature with coils wound in one single layer which were connected in various ways according to requirements. It was an excellent machine for experimental purposes, furnishing sinusoidal currents of from 10,000 to 20,000 cycles per second. The output was comparatively large, due to the fact that as much as 30 amperes per square millimeter could be past thru the coils without injury.

The diagram in Fig. 2 shows the circuit arrangements as used in my lecture. Resonant conditions were maintained by means



Tesla's System of Wireless Transmission Thru the Earth as Actually Exposed in His Lectures Before the Franklin Institute and Electric Light Association in February and March, 1893. Fig. 8.

of a condenser subdivided into small sections, the finer adjustments being effected by a movable iron core within an inductance coil. Loosely linked with the latter was a high tension secondary which was tuned to the primary.

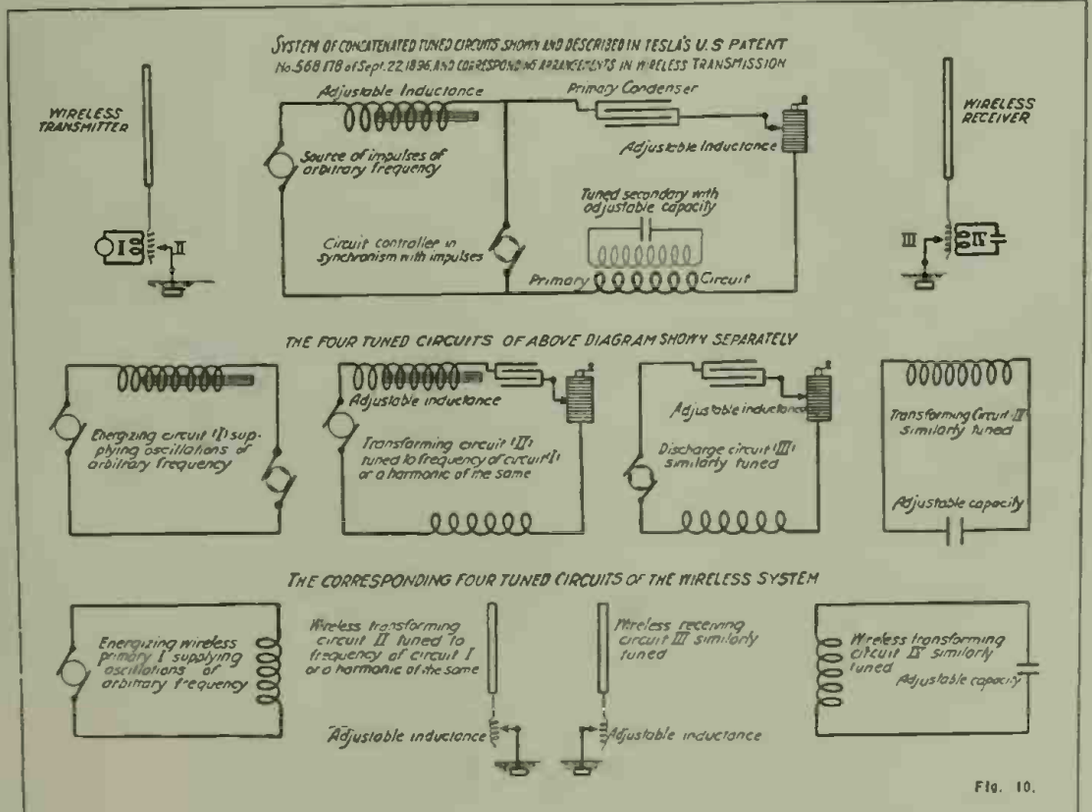
The operation of devices thru a single wire without return was puzzling at first because of its novelty, but can be readily explained by suitable analogs. For this purpose reference is made to Figs. 3 and 4.

In the former the low resistance electric conductors are represented by pipes of large

The Forerunner of the Audion—the Most Sensitive Wireless Detector Known, as Described by Tesla in His Lecture Before the Institution of Electrical Engineers, London, February, 1892. Fig. 9.

section, the alternator by an oscillating piston and the filament of an incandescent lamp by a minute channel connecting the pipes. It will be clear from a glance at the diagram that very slight excursions of the piston would cause the fluid to rush with high velocity thru the small channel and that virtually all the energy of movement would be transformed into heat by friction, similarly to that of the electric current in the lamp filament.

The second diagram will now be self-explanatory. Corresponding to the terminal capacity of the electric system an elastic reservoir is employed which dispenses with the necessity of a return pipe. As the piston oscillates the bag expands and contracts, and the fluid is made to surge thru the restricted passage with great speed, this



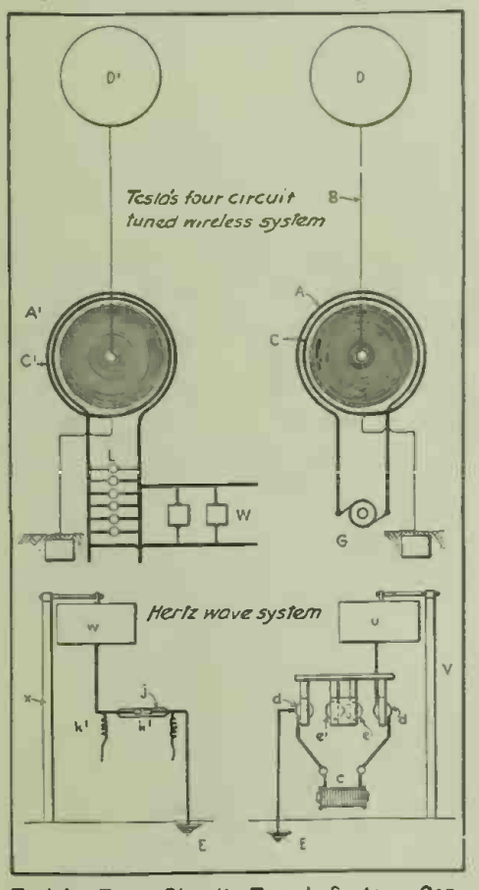


Fig. 10.

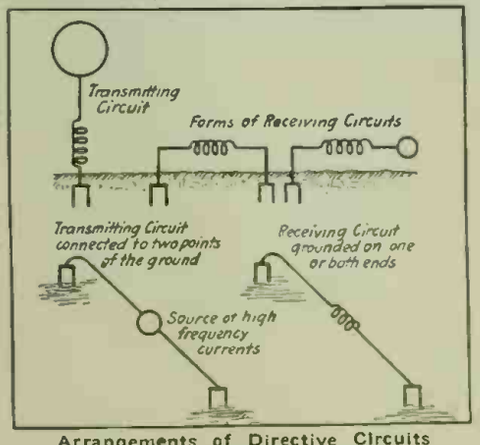
Tesla's System of Concatenated Tuned Circuits Shown and Described in U. S. Patent No. 568,178 of September 22, 1896, and Corresponding Arrangements in Wireless Transmission.

www.americanradiohistory.com



resulting in the generation of heat as in the incandescent lamp. Theoretically considered, the efficiency of conversion of energy should be the same in both cases.

Granted, then, that an economic system of power transmission thru a single wire is

Tesla's Four Circuit Tuned System Contrasted With the Contemporaneous Hertz-wave System. Fig. 11.

practicable, the question arises how to collect the energy in the receivers. With this object attention is called to Fig. 5, in which a conductor is shown excited by an oscillator joined to it at one end. Evidently, as the periodic impulses pass thru the wire, differences of potential will be created along the same as well as at right angles to it in the surrounding medium and either of these may be usefully applied. Thus at *a*, a circuit comprising an inductance and capacity is resonantly excited in the transverse, and at *b*, in the longitudinal sense. At *c*, energy is collected in a circuit parallel to the conductor but not in contact with it, and again at *d*, in a circuit which is partly sunk into the conductor and may be, or not, electrically connected to the same. It is important to keep these typical dispositions in mind, for however the distant ac-

Arrangements of Directive Circuits Described in Tesla's U. S. Patent No. 613,809 of November 8, 1898, on "Method of and Apparatus for Controlling Mechanism of Moving Vessels or Vehicles." Fig. 12.

tions of the oscillator might be modified thru the immense extent of the globe the principles involved are the same.

Consider now the effect of such a conductor of vast dimensions on a circuit exciting it. The upper diagram of Fig. 6 illustrates a familiar oscillating system comprising a straight rod of self-inductance $2L$ with small terminal capacities cc and a node in the center. In the lower diagram of the figure a large capacity C is attached to the rod at one end with the result of shifting the node to the right, thru a distance corresponding to self-inductance X. As both parts of the system on either side of the node vibrate at the same rate, we have evidently, $(L + X)\ c = (L - X)\ C$ from which $X = L\,\frac{C - c}{C + c}$. When the capacity C becomes commensurate to that of the earth, X approximates L, in other words, the node is close to the ground connection. *The exact determination of its position is very important in the calculation of certain terrestrial electrical and geodetic data* and I have devised special means with this purpose in view.

My original plan of transmitting energy without wires is shown in the upper diagram of Fig. 7, while the lower one illustrates its mechanical analog, first publisht in my article in the *Century Magazine* of June, 1900. An alternator, preferably of high tension, has one of its terminals connected to the ground and the other to an elevated capacity and impresses its oscillations upon the earth. At a distant point a receiving circuit, likewise connected to ground and to an elevated capacity, collects some of the energy and actuates a suitable device. I suggested a multiplication of such units in order to intensify the effects, an idea which may yet prove valuable. In the analog two tuning forks are provided, one at the sending and the other at the receiving station, each having attached to its lower prong a piston fitting in a cylinder. The two cylinders communicate with a large elastic reservoir filled with an incom-

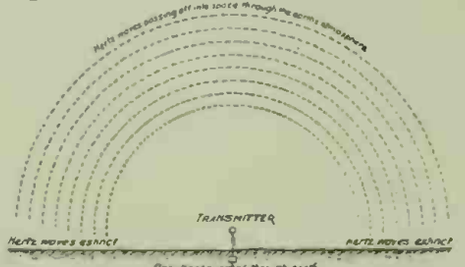


Diagram Exposing the Fallacy of the Gliding Wave Theory as Propounded in Wireless Text Books. Fig. 13.

pressible fluid. The vibrations transmitted to either of the tuning forks excite them by resonance and, thru electrical contacts or otherwise, bring about the desired result. This, I may say, was not a mere mechanical illustration, but a simple representation of my apparatus for submarine signaling, perfected by me in 1892, but not appreciated at that time, altho more efficient than the instruments now in use.

The electric diagram in Fig. 7, which was reproduced from my lecture, was meant only for the exposition of the principle. The arrangement, as I described it in detail, is shown in Fig. 8. In this case an alternator energizes the primary of a transformer, the high tension secondary of which is connected to the ground and an elevated capacity and tuned to the imprest oscillations. The receiving circuit consists of an inductance connected to the ground and to an elevated terminal without break and is resonantly responsive to the transmitted oscillations. A specific form of receiving device was not mentioned, but I had in mind to transform the received currents and thus make their volume and tension suitable for any purpose. This, in substance, is the system of today and I am not aware of a single authenticated instance of successful transmission at considerable distance by different instrumentalities. It might, perhaps, not be clear to

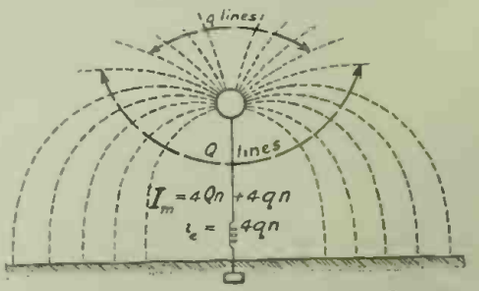

Fig. 14. Diagram Explaining the Relation Between the Effective and the Measured Current in the Antenna.

those who have perused my first description of these improvements that, besides making known new and efficient types of apparatus, I gave to the world a wireless system of potentialities far beyond anything before conceived. I made explicit

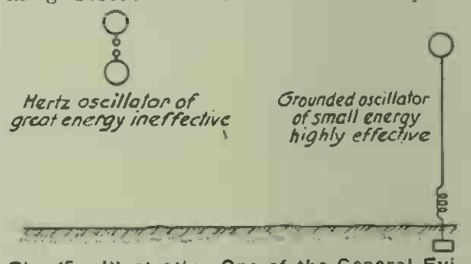

Fig. 15. Illustrating One of the General Evidences Against the Space Wave Transmission.

and repeated statements that I contemplated transmission, absolutely unlimited as to terrestrial distance and amount of energy. But, altho I have overcome all obstacles which seemed in the beginning unsurmountable and found elegant solutions of all the problems which confronted me, yet, even at this very day, the majority of experts are still blind to the possibilities which are within easy attainment.

My confidence that a signal could be easily flashed around the globe was strengthened thru the discovery of the "rotating brush," a wonderful phenomenon which I have fully described in my address before the Institution of Electrical Engineers, London, in 1892, and which is illustrated in Fig. 9. This is undoubtedly the most delicate wireless detector known, but for a long time it was hard to produce and to maintain in the sensitive state. These difficulties do not exist now and I am looking to valuable applications of this device, particularly in connection with the high-speed photographic method, which I suggested, in wireless, as well as in wire, transmission.

Possibly the most important advances during the following three or four years were my system of concatenated tuned circuits

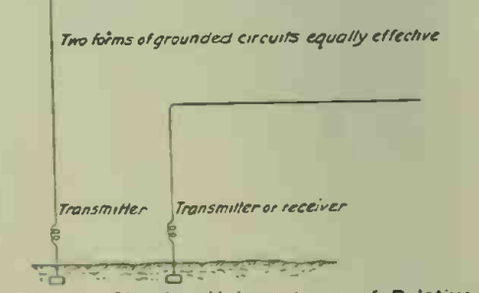

Fig. 16. Showing Unimportance of Relative Position of Transmitting and Receiving Antennae in Disproval of the Hertz-wave Theory.

and methods of regulation, now universally adopted. The intimate bearing of these inventions on the development of the wireless art will appear from Fig. 10, which illus-

Novel Generators

IMAGINE yourself wearing a set of head receivers and a telephone transmitter and listening to a voice saying, *"I am right over R 7 and your shells are all bursting 'short.' Increase range 50 yards."* That was the experience of American radio operators during the latter part of the war, for radio telephone sets were developed that enabled men on the ground to talk with airplanes flying over the enemy lines and aim the guns according to their directions.

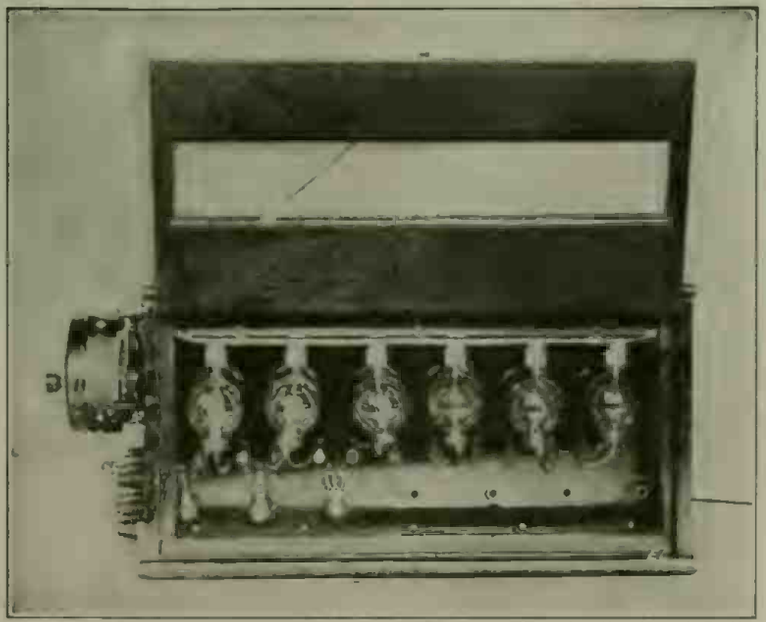
An essential feature of the radio telephone set is a small generator to deliver direct current at from 275 to 350 volts. For airplane use, these generators also delivered current at 25 volts. One is mounted on the landing gear of each 'plane, so that the air "back-wash" of the propeller drives a small two-blade wooden fan on the generator shaft. Thus the generator runs whenever the 'plane is in motion, and also while it is on the ground with the engine running. Constant voltage with variable speed is secured by an ingenious arrangement of differential fields controlled by a two-element vacuum tube mounted in the *stream-line* housing of the generator.

At stations on the ground or on shipboard, power is taken from storage batteries, and here a small dynamotor, driven by 10-volt current, gives the required high voltage. In the field one of these sets was originally mounted on a light metal frame carrying a voltmeter, fuses and terminals. Quite recently an aluminum carrying-case was developed which was watertight when closed. All the switches, fuses, etc., are mounted inside.

A submarine chaser often lies motionless, waiting for a U-boat to stick its nose above the surface. So sensitive are the listening devices on the submarines that even the slight hum of one of these dynamotors, transmitted to the chaser hull, would betray its position. Hence the dynamotors furnished to the Navy are mounted in a cradle of coil springs as here illustrated. *Photos courtesy Westinghouse E. & M. Co.*

Above:—Spring Cradle Suspension of the Wireless Generators Used on U. S. Naval Submarine Chasers and Destroyers, to Eliminate the Transmission of the Humming Sound Produced by Their Operation, to the Steel Hull of the Vessel and Its Subsequent Interception by a Lurking U-boat. The Sub-sea Sound Detector Used by the German Submarines Was so Sensitive That This Precaution Was Necessary.

Ground Officers of the U. S. Army Talking to Airplanes In Flight by Means of Wireless Telephone. The Range of Such Communication Has Recently Been Increased to 150 Miles by Official Test.



At Right:—Lower Right-hand View Shows the Wind-driven Airplane Radio Generator Developed During the War. Its Speed, of Course, Varies with the Velocity of the 'Plane and How Its Voltage Is Maintained Constant with Variable Speed Is One of the Interesting Problems That Radio Engineers Had to Solve Before Anything Else Could Be Done.

Boosts Signals 1,000,000 Times

The six-step audion amplifier set here shown represents the latest development in amplifiers, and its intensifying qualities are enormously in excess of any similar apparatus produced heretofore. Under ordinary conditions, this set will *amplify* 1,000,000 *times*, so it is especially well adapted for use in connection with the reception of the very weak signals set up by the small portable transmitters used in modern warfare. As a matter of fact, the set has been designed strictly with an eye towards military field work, and similar purposes, and has already proved its efficiency along such lines. An entirely new departure in design is seen in the fact that only one "A" battery, and one "B" battery are employed. In addition, these batteries are practically free of adjustment, which greatly enhances the value of this set, and is a unique feature in amplifier construction.

In connection with the above apparatus, it may be mentioned that the success of the French armies was in part due to the wonderful results achieved with such amplifiers on the various battle-fronts. Amplifiers using as many as nine steps were employed with marked success in trench communication, aerial communication, and similar work.

The Most Powerful Vacuum Tube Amplifier Now Standardized and Built. It Is a Six-stage Amplifier and Possesses an Amplifying Power of 1,000,000 Times. It Solved Many Knotty Problems During the War.

In the lower left-hand corner of the panel is mounted a simple two-way switch, by means of which the first bulb can be made either a detector for radio signals or the first-step amplifier for audio-frequency currents. When used as a detector, the connections from the tuner are made to the upper pair of external binding posts. When used as an amplifier, the connections from the detector (or the two-ground terminals, in case one is receiving conduction or induction currents thru the earth) are made to the lower pair of external binding posts. To the other pair of binding posts is connected the six-volt storage battery.

The telephone cord terminates in a plug, which can be plugged into the third, fourth, fifth or sixth jack cord to the degree of amplification which is desired.

www.americanradiohistory.com

U. S. Adopts Multiplex Radio

THE recent announcement that the Government had decided to adopt the multiplex system of radio telegraphy and telephony, makes possible some entirely new methods of communication.

The multiplex radio system is a complex one. The multiplex system of ordinary telegraphy permits the sending and receiving of eight different messages on one wire at the same time. Thus it may be seen what a great advantage it holds over the old method of Morse telegraphy.

Radio messages are sent by the same method. The trans-Atlantic Radio Room in the Navy Department illustrated herewith is completely equipt with a multiplex radio outfit. By this new system Secretary Daniels is able to keep in communication with several vessels out at sea at the same time. Likewise, President Wilson, on his voyage to France, was able to keep in immediate communication with Washington.

A Recent Photo Taken of the U. S. Navy Department's Trans-Atlantic Radio Operating Room. Multiplex Radio Signaling Is Now Carried on in Both Directions across the Ocean.

This photograph is the first to be released showing the trans-Atlantic Radio Operating Room of the Navy Department.

This is the receiving room of the radio station in the Navy Department. Four receiving machines constitute, with the four perforating machines, one complete unit of multiplex radio-telegraphy. As a result, four messages may be sent and four received over one antenna at the same time.

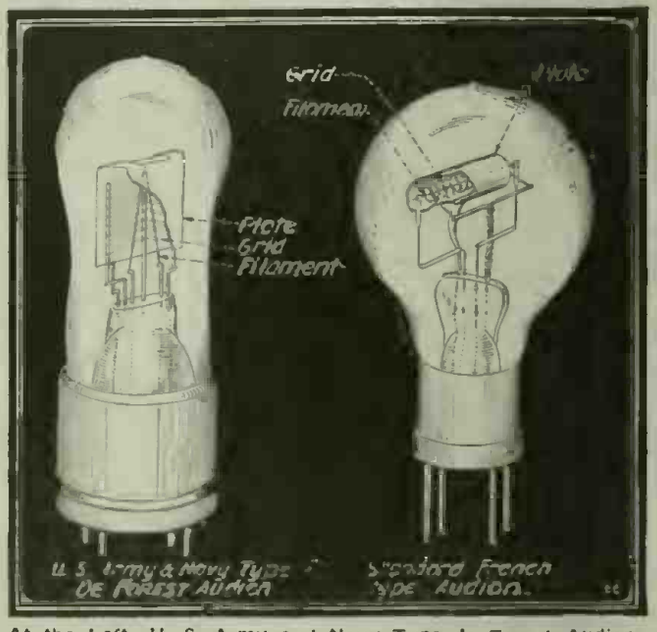
RADIO LINKS 3,000 MILES BETWEEN OMSK AND LYONS.

Omsk, in which are centered the hopes for the rebuilding of a new Russia, after months of isolation, is now actively in wireless communication with the outside world. Hourly reports, containing a complete news service, are received in Omsk direct from the French wireless station at Lyons, France. Outgoing communication will be inaugurated soon.

From Omsk to Lyons is 3,000 miles on a direct air line over Bolshevik Russia and Central Europe. Omsk is about midway between the Atlantic and Pacific oceans.

AN OMISSION.

We wish to state that credit for the photographs accompanying the article entitled "The City of Splendid Night" by Amos Stote, publisht in the January, 1919, issue, should have been given to the New York Edison Co.



New French and American Audions

UNDOUBTEDLY the radio amateur and experimenter has often wondered what form of audion or vacuum detector and amplifier was being used both by the American and European armies. Thru the courtesy of Dr. Lee de Forest, we are enabled to show herewith the standard form of three-electrode audion in use by the French Army signal corps, as well as by the French Navy, and also the standard form of three-electrode audion in use by the United States Army Signal Corps.

As we have heard but very little concerning the French and other European wireless apparatus for several years, owing to the war conditions existing, we find considerable interest in the French type of vacuum bulb detector and amplifier, and so we will consider it first.

As the illustration shows it comprises a spherical form of glass bulb, which is eventually pumped out to a very high degree of vacuum. One thing decidedly noticeable about both the French and American tubes, is the simplified and highly improved form of base which incorporates four contact pins, which form a juncture with four sockets in the bayonet-joint receptacle supporting the audion. Two of the contact pins lead to the incandescent filament, while the other two connect to the grid and the plate respectively. It is thus but a moment's work to snap a bulb out of its socket and replace it with another one.

The French audion is unique in its general design, as will be noted from the accompanying illustration, the filament being in the form of a fine straight wire passing thru the center of the grid, which takes the form of a helical coil of non-oxidizing wire. Outside of the helical grid, we find the wing or plate element, which is made in the form of a small cylinder or tube. Each of the three distinct elements comprising the audion are spaced about 3/32 inch apart. It is stated on good authority that during the war the French Government manufactured five thousand of these audion bulbs every day, or almost two million of them in a year. This rate of audion production was carried on during the last two years of the war. The French bulb here shown is particularly interesting as being efficient and suitable in all three functions,—detector, amplifier and oscillator.

At the Left—U. S. Army and Navy Type de Forest Audion. At Right—the Famous French Type of Three Electrode Audion, Five Thousand of Which Were Manufactured Every Day during the Last Year of the War. It Serves as Detector, Amplifier and Oscillator.

The Standard United States Army type of three-electrode audion here shown comprises filament, grid and plate, rigidly secured in place in the manner indicated. Particular attention has been given in this design to the manner of supporting the inverted "V" type filament as well as the grid and plate elements, so that as a matter of fact these rugged bulbs can be handled without any particular pains, and none of the electrode elements can move as they could in the older types. A still better construction is involved in a modified and improved form of audion being developed for the United States Signal Corps by Dr. de Forest. It will be seen how the plate member is bent into the shape of an inverted "U" and rigidly secured by two wire members securely molded or fused into the glass stem. The fine wire grid is securely mounted in place inside of the plate member on two upright wire legs as shown, and the top of the filament is anchored and supported by a third wire secured in the glass stem. There is still a slight chance for a little movement between the electrode elements in this detector, and in the improved form aforementioned and which is now being developed and perfected, the filament, grid and plate are still further strengthened, so that no matter how much the bulb is jarred or shaken, no variation whatsoever can occur in the spacing between any two of the three electrodes.

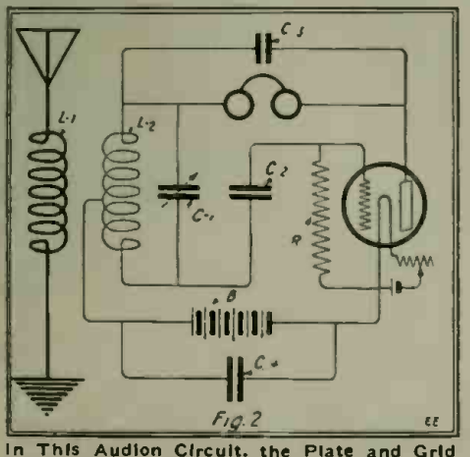
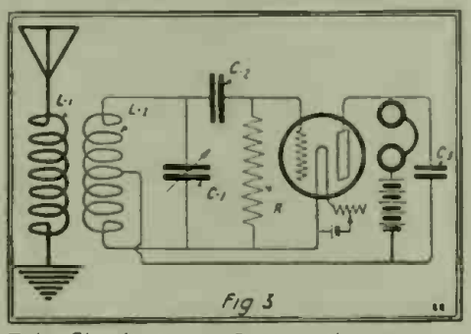
New Regenerative Vacuum Tube Circuits

By SAMUEL D. COHEN



DURING the war the vacuum tube has gone into very extensive use in radio communication and other allied electrical fields. The regenerative circuits used until now have been found satisfactory. However, certain improvements were discovered and it is the privilege of the writer to give the results of some of these improvements that were made on regenerative vacuum tube circuits for the reception of long distance stations using long wave lengths.

One of the schemes tried by the writer was to couple the grid to the plate of the vacuum tube directly in the antenna system of the oscillating circuit, in order that heterodyne method of reception might be accomplished with maximum efficiency. For this work it was essential to construct a coupled magnetic system in order to accomplish the desired effects and the accompanying photograph shows a special type of inductive coupler utilized thruout these experiments. It will be noted from the



This New Audion Regenerative Circuit Utilizes a Five Coil Loose Coupler, Which Is Described In Detail by the Author. By This Arrangement the Grid and Plate Circuits Are Coupled Magnetically. There Are Two Secondary Coils Which Form a Variometer.

photograph that the primary winding consists of two distinct coils *wound on the same tube* and in the same direction. The third coil which is swung on a pivoted arm as indicated moves into the magnetic field of one of these coils. The secondary of the coupler also consists of two coils, moving one inside of the other, thus comprising

In This Audion Circuit, the Plate and Grid Are Coupled Magnetically Thru Coil L_2, and the Central Tap Should Be Accurately Taken Off.

This Circuit for a Regenerative Vacuum Tube Is Similar to That Given In Fig. 2, and Needs no Special Comment.

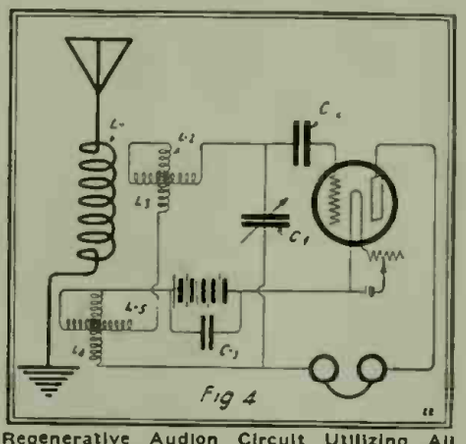
a variometer. The coupling of both of these coils can be changed at will, both within the main primary and outside of the primary. This was essential in order to eliminate the use of switches for the control of the inductance of the coils.

The coils were built with great care, in order to eliminate the undesirable oscillations produced within the coil circuits, due to the inherent distributed capacity of the coils.

A circuit giving remarkable results in amplifying received signals is that shown in Fig. 1. The main inductance L_1 is the main primary connected in series with the small coil wound on the same tube L_4, which is thereafter connected to the ground as indicated. L_2 and L_3, which comprises the secondary of the coupler are connected in a variometer manner as indicated. The joint point of these coils is connected to the filament terminal of the vacuum tube. The end of the coil is linked to the battery B, of the plate, while coil L_2 is connected

ROGERS UNDERGROUND ANTENNA

Since the publication of the Rogers underground antenna in our March issue we have been flooded with letters from amateurs all over the country who desire to have further information on this wonderful radio development. The standard question asked by most of these correspondents is, how large is the antenna, how to connect it, etc. In a few words, we might say that a satisfactory method is to use about 100 to 300 feet of ordinary standard automobile rubber cable, burying same in a 3-foot earth trench. The cable is then covered up entirely. One end is insulated, the other end goes to the instruments *taking the place of the former aeriol.*

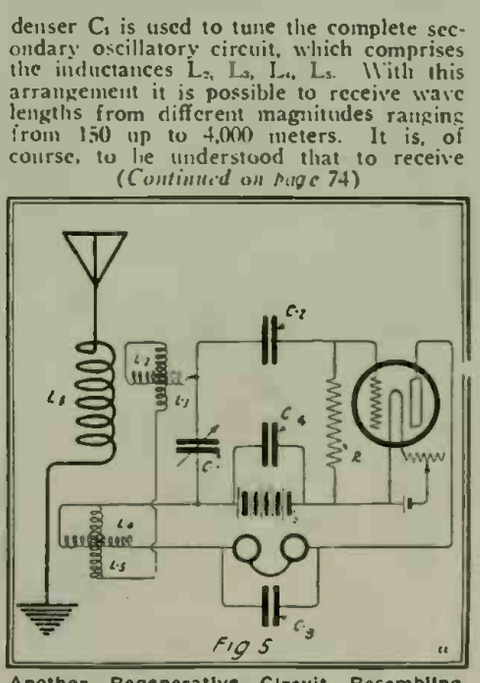


In our next issue we shall have a comprehensive article specially prepared for amateurs on the Rogers Underground System.—*Editor.*

to the tertiary coil L_5, which coil is the one mounted on the moving arm as indicated on the right of the photograph. Coils L_5 and L_4 are coupled magnetically and electrostatically thru the condenser C_1. It will thus be seen from the diagram that the plate and grid are coupled thru the inductance L_3 and which said inductance is coupled to the antenna system L_1. A critical adjustment is necessary between L_4 and L_5, and between L_2 and L_3, to give maximum radio frequency amplification in the circuit. Condenser C_3 has a magnitude of the order of two microfarads and is used in general to permit the high frequency current to readily pass to the plate.

Another circuit is shown in Fig. 2, which gave excellent results. In this circuit, the plate and grid are coupled magnetically thru coil L_2. In this particular case, it is very essential to note that the filament coil line should be tapt off exactly at the center of coil L_2 in order to give best results. This is done in order to equalize the potentials between the grid and plate circuits. Coil L_2 can be made as a variometer as will be shown later. Condenser C_1 is a regular oscillatory secondary tuning condenser. The resistance R is a grid leak-resistance and its magnitude depends upon the operating characteristics of the tube.

A similar circuit to that of Fig. 2 is shown in Fig. 3, and needs no comment.



In Fig. 4 is shown another circuit for accomplishing the necessary results for regenerative effects for better efficiency. It will be noted that the inductances L_2 and L_3 comprise a variometer secondary coupled to the primary L_1. The inductance L_1 is coupled magnetically to the antenna inductance L_1 and to inductance L_5, which comprises another variometer of both L_4 and L_5, coupled magnetically to the plate and wing circuit of the vacuum tube. Con-

Regenerative Audion Circuit Utilizing All Five Coils on the Loose Coupler. Variable Condenser C_1 Is Used to Tune the Complete Secondary Oscillatory Circuit in the Manner Indicated.

denser C_1 is used to tune the complete secondary oscillatory circuit, which comprises the inductances L_2, L_3, L_4, L_5. With this arrangement it is possible to receive wave lengths from different magnitudes ranging from 150 up to 4,000 meters. It is, of course, to be understood that to receive

Practical Chemical Experiments

Testing of Wool, Cotton and Linen

By ALBERT W. WILSDON

The Two Long Illustrations on This Page Show How Various Textiles Such as Cotton, Silk, Linen, Etc., Look Under the Microscope. Microscopic Examination of Such Textiles Is Considered One of the Best Methods of Determining Just What a Certain Fabric Is Composed of. Microscopic Drawings of the Various Fabrics Shown In the Illustration Above are:—1—Cotton, 2—Wool, Various Kinds, 3—Silk, 4—Linen, 5—Hemp, 6—Cotton and Linen Mixed, 7—Cotton and Wool, 8—Cotton and Silk, 9—Shoddy, Made from New, Fine, Blue Worsted Clips.

IN order that the layman may be more familiar with methods of making quick and accurate tests of varied textiles, this article is written, and not with an object of a complete treatise on "Textile Testing," which work in its entirety may be written in several volumes.

A person buying a piece of material, let

Fig. 19. The Burning Test Applied to Various Cloth Materials to Determine Their Composition, Particularly the Presence of Wool. Vegetable Fibers May Be Readily Distinguished from Animal Fibers By Burning, Animal Fibers Such as Silk and Wool Giving Off the Smell of Burnt Horn. They Do Not Fire Like Vegetable Fibers, But Cease to Burn When Removed from the Flame. Vegetable Fibers Give Off a Slight Odor of Burnt Wood When Ignited, and They Burn Away Very Rapidly With a Flash, leaving No Hard Cinder, But a White or Gray Ash Only.

us say for a suit, does not want to feel that he is being imposed upon by having inferior substitutes sold him when he believes it is all wool. He must, therefore, have immediately available some means of testing.

Textiles may be separated into two main divisions, as we may call them. VEGETABLE FIBERS, under which heading appear *Cotton*, *Flax*, *Hemp*, etc., and ANIMAL FIBERS, as *Wool* and *Silk*.

COTTON appears under the microscope as a wide band, generally twisted, as shown in Fig. 1. Chemically, cotton fiber, separated from all impurities, may be looked upon as pure Cellulose, similar in composition to the Cellulose in starch. Ordinary raw cotton is not pure Cellulose, containing as it does, various impurities such as wax, oil, coloring matter, water and about 1 per cent. of mineral matter.

The appearance of various kinds of WOOL under the microscope is shown in Fig. 2. Wool differs very considerably in chemical composition from Cotton and Flax. It consists of horny-matter (*Keratin*), Carbon, Hydrogen, Oxygen, Nitrogen and Sulfur. This composition is strikingly noticed when wool is burnt, accounting for the peculiar and disagreeable smell of *burning horn* which is given off. Boiling Caustic Soda or Potash solutions dissolve Wool, and if Acetic Acid in excess is added to the solution obtained Hydrogen Sulfid is given off.

SILK, under the microscope, exhibits no definite structure, but consists of cylindrical or flattened, sometimes helical, compact threads, having the appearance of a smooth cylinder without any contents. Fig. 3 depicts Silk as seen under the microscope. Chemically, Silk is composed of silk gelatine, silk fiber, with fat, coloring matter and mineral substances.

FLAX-LINEN fibers consist of chemically pure Cellulose, and are of regular thickness. The cells are built up in a regular manner, cylindrical in shape, having *nodes* arranged at regular intervals as shown in Fig. 4.

In HEMP the cells are very irregular in form, and do not possess *nodes* as in the former case. The cell walls are not of such constant thickness as Flax, and the ends of the fibers are blunt, having thick walls, frequently branching laterally.

SHODDY is old woolen or worsted materials, torn to pieces by a machine having spiked rollers, which reduces them to fibers. They are then cleaned, and the fiber spun with a certain proportion of new wool.

Broadly, shoddy fibers are of two kinds, namely—those obtained by mechanical disintegration alone from the clippings, and second, those fibers that are obtained from rags that have been carbonized. It thus becomes necessary to consider first the result of a purely mechanical operation, and in the latter case, combined chemical and mechanical operations. Naturally, we con-

Fig. 20. This Shows Apparatus Arranged for the Accurate Testing of Cotton and Wool Content of Cloth, and One That Is Used By Practically All Commercial Cloth Testers. One Glass Contains a Solution of Caustic Potash, or Caustic Soda, Into Which Is Immersed a Sample of the Wool to Be Tested: A Precipitat Indicates the Relative Amount of Cotton and Other Substances Present. Likewise When Cotton Is Immersed in an Acid, a Precipitat Will Show the Relative Amount of Adulterants. See Also Fig. 7.

sider whether the chemical operation of carbonizing has in any way altered the fibers so that they might differ microscopically from those treated only mechanically.

Pure wool, when first sheared from the sheep, shows that the fibers are terminated at one end with a slightly rounded point, while the other end shows a more or less

Experiments in Radio-Activity

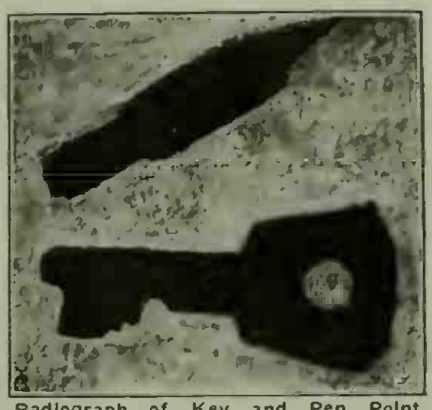
By IVAN CRAWFORD

PART III.

IN the last article ionization by a-rays was discust. The radiations of radium also possess the property of affecting photographic plates. This action of radio-active substances is essentially an ionizing property and the effect produced is

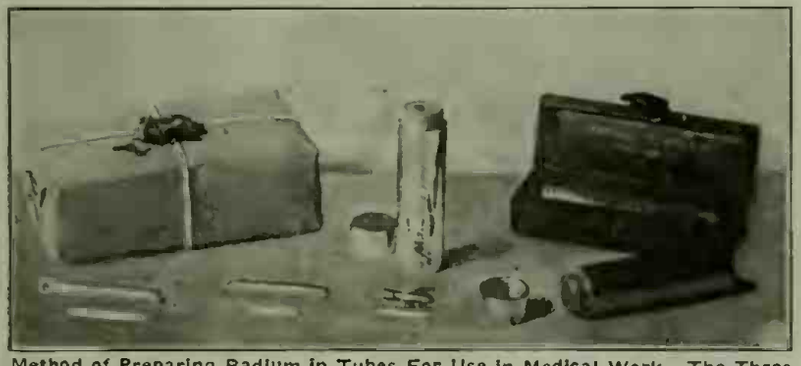
Arrangement of Plate and Uranium Salt in Taking Radiographs.

proportional to the ionizing power of the substance.



Both the a and b particles ionize the air thru which they pass; however, the a-particles do this to a larger extent. In fact the total number of ions per sec., due to the complete absorption of a-rays from one gram of radium, is 2.56×10^{10}, while the beta rays from the same amount of radium produce only 9×10^{4}. It will be seen from this that the a-rays would affect the plate to a much greater degree than the b-rays. This is only true when there is no obstruction between the substance and the plate. When a solid is interposed the effect is accomplished almost entirely by the b-rays on account of their greater penetrating power.

Geitel, and afterwards Becquerel and Mme. Curie showed that the b-rays were subject to magnetic deflection. The experiments conducted by Kaufmann and Becquerel have shown that the b-particles consist of negatively charged particles projected with an exceedingly high speed, indeed almost approaching that of light. These experiments also proved their mass was equal to that of the cathode particle in vacuum tube phenomena. Really, however, the b-particles are electrons ejected from radio-active substances at a considerably higher speed than that observed for the cathode particle.



To show the effect of b-rays on photographic plates a very simple device suffices. The following experiment may be easily carried out. An ordinary photographic plate is wrapt in black paper; a few metal objects, such as coins, keys, etc., are then placed upon it and covered with a piece of radio-active ore. Any uranium or thorium salt may be used instead. The exposure should last several days. The action is much slower than X-rays and the results much less clearly defined. A plate with uranium salts on it is shown in Fig. 1. This lack of definition makes this method ill-adapted for practical radio-graphy. The salts of uranium and thorium have been found to give off the beta particles which affect the photographic plate. An interesting experiment is to take an incandescent gas mantle which contains thorium, and spread it evenly over a photographic plate. After a long exposure the plate will be seen to be affected.

Niewenglowski has shown that phosphorescent calcium sulfid after being exposed to sun-light, assumes the power of emitting beta particles. These particles are extremely penetrating, and are capable of affecting photographic plates even thru comparatively thick sheets of intervening metal. This property, however, differs from ordinary radio-activity. The sunlight seems to cause a disintegration of the calcium atom, causing an emission of beta rays.

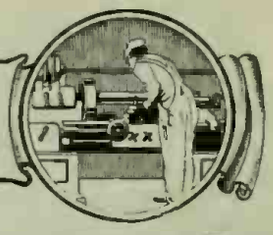
Much better radiographs may be obtained if the ionizing agent is the active portion from a spinthariscope. This is a wonderful little instrument and should be in the hands of every experimenter of radio-activity. Considering the great variety of experiments which may be performed with it, and the comparatively small sum for which it may be procured from several leading houses, the experimenter, if at all possible, should possess himself of one. It is, while being an extremely interesting and instructive apparatus, a very simple one. In its common form it somewhat resembles the eyepiece of a microscope. The distal lens is removed, and in its place is put a metal plate upon which a thin layer of phosphorescent zinc sulfid is glued. Just above this screen and with its end about over the middle of it, a small watch hand is secured. To the extremity of this a small quantity of radium salt is fastened. In some spinthariscopes the arm which supports the active substance is removable, allowing it to be utilized in the making of radiographs. Those, however, which are fitted with stationary arms or those in which the active substance is placed directly on the screen, may be employed by removing the lens portion and using the case alone. When using a spinthariscope for making radiographs the exposure need only last about two days. This is because of the much greater activity of the substances used in the construction of these instruments. If figures such as letters be cut from heavy lead foil or some metal sheet and interposed between the spinthariscope element and the plate, their shadow will be clearly discernible. Many interesting photographs may be made in this manner. The author has found that it is impractical to attempt the construction of such an instrument as they are more cheaply bought. Of course there are many variations of the experiments just described which will not be given here as they will doubtless suggest themselves to the reader's mind.

Radiograph of Key and Pen Point Taken with Radium Ore. Exposure Three Days.

Method of Preparing Radium in Tubes For Use in Medical Work. The Three Small White Tubes Contain Radium Sulfate and Have Respectively 2,550 and 100 Milligrams of Radium Element Content. Beside them Are the Silver and Platinum Screens Used, Back of Which Is the Brass Carrying Tube, Together with a Package Ready for Shipment.

A Small Silica Capsule, Shown in Natural Size, Containing 1.764 Milligrams of Anhydrous Radium Barium Bromid, Having a Radium Element Content of 740 Milligrams. At the Present Market Price of $120 Per Milligram, This Radium Shown in the Dish Has a Cash Value of $88,800.

Before closing this article it has been thought fitting, however, to describe several experiments with this remarkable little instrument—the spinthariscope. If the experimenter will take the spinthariscope into a dark room he will be able to see wonderful flashes of light resembling shooting stars. It is best for the observer to remain for several minutes in the dark before attempting his observations, so to allow the eyes to become accustomed to the darkness. Upon further observation a pulsating nebula of light surrounded by flashing meteors will be seen. This is caused by the fluorescence due to the ions from the disintegrating atom striking the zinc and sulfid screen. The spinthariscope clearly shows the constant shower of particles given off by radio-active substances without any sensible depreciation in their weight or power.



The spinthariscope may be used in another very interesting and instructive experiment. The earlier experimenters with

THE CONSTRUCTOR

The "Noiseless" Phonograph

By THOMAS REED

I WISH you knew Gladys Doolittle. No I don't, either. I've got no grudge against you. The Doolittles live in the next wing of my hotel, and as their parlor windows face mine I know all about the family, except who they are. "Gladys Doolittle," is only *one* name I call her—among others, yes, many others!

Gladys entertains a young man quite frequently. It isn't the same young man—I wish it was. She's "looking 'em over," and the specimens come on in a remarkably even procession, one at a time, some way she has it fixt. No fights, or jostling in the ante room; never any novelty like that.

Her entertainment is a stock sketch, always the same. From 8 to 9, the visitor engages in conversation with "Pa" Doolittle about what they've both read in the newspaper, while Gladys butts in occasionally with remarks on the sock she's trying to knit. Thus "Pa" samples him, and at the same time the victim makes up his mind whether he likes this better than the hall bedroom on the whole. About 9, he tries to pet the dog—one of these micro-dogs it is—and it bites him; the cake hound has to have his sample, too, I suppose. At 9:15, "Pa" retires. He's a nervous wreck or something, and needs the sleep; if he forgets he needs it, Gladys reminds him. Then, new scene: she turns off all the bulbs except the pink reading-lamp, chases the knitting off the davenport, and trails over and opens up the phonograph. The "vamping" is about to begin.

So far the performance has been confined to the home, but from this on it invades the neighborhood, and atrocities come hard and fast. Gladys uses "haunting" melodies in her vamping business, and as the vampees are always different, one haunter is all she needs at a time. When she first came it was "Memories," but that wore out on her, and ever since then it's been "Poor Butterfly." Does it haunt? Well, look: when Gladys laps her lily finger and gives that record the initial twirl, and old "But" soars out into the community with his ragtime triplets fluttering around him, we know too well it'll be an hour before the trusty insect will be allowed to fold his painted pinions and beat it back to the envelope. Does it haunt? Woof!

I'm slowly getting crazy from it. Perhaps you've noticed signs of it in my writings. What's that, somebody says—"What d'ye mean *slowly?*" Well, all right, you know the cause of it, anyway. I have an idea I could sue Gladys or her father or somebody and get damages—if the jury should decide I was less valuable crazy than the way I was before. If anybody wants to buy my claim, I'll make an attractice price on it, for cash "or what have you?"

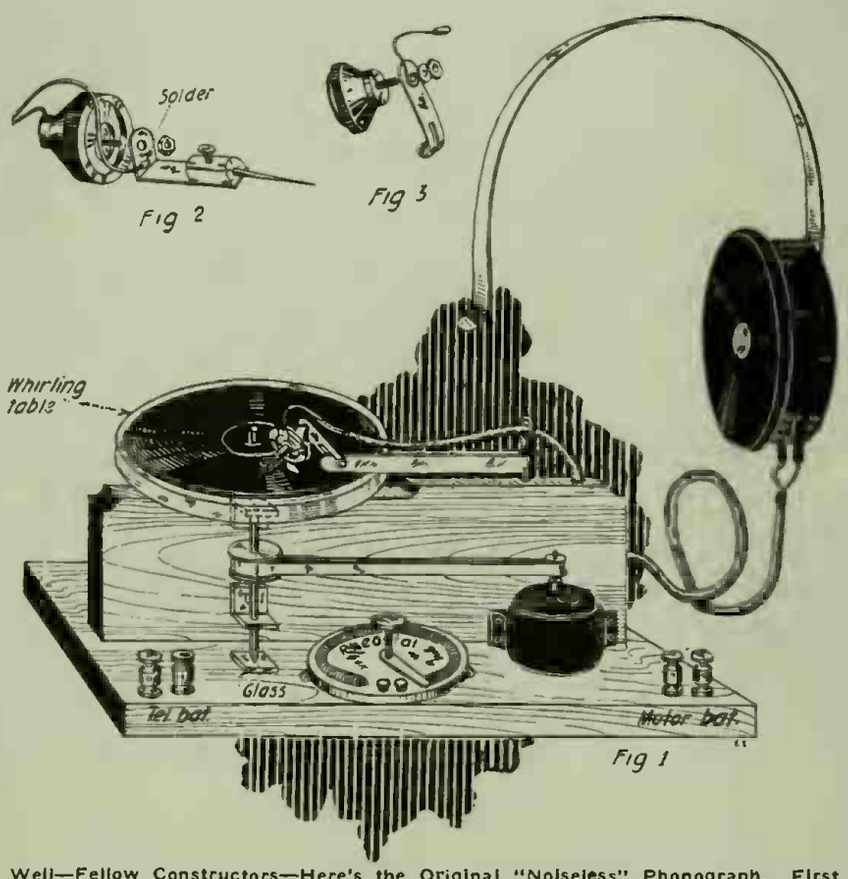
I suppose it isn't really Glad's fault that the instrument she's using in her "laboratory" operates on the neighbors as well. Phonographs are loud! all of 'em. The manufacturers took pains to make 'em so, out of an absolute misconception. They got the idea very early that several or more people would like to hear 'em at once. Why, even now, when they ought to know better, they publish those pictures showing the whole family sitting spellbound, mother dropping her sewing and Johnny his Meccano or volume of Browning, and all that.

The facts are just the other way. Johnny delights in the jangled jazz that nobody can follow but himself, that makes the baby cry and the others want to. If Little Sister starts the well-worn maxixe, and falls to dreaming of the slim-waisted lounge-lizard she's seen in the movies, mother fidgets and glances at her offspring with apprehension; and when Big Sister puts on the $7.00 "operatic," father picks up his paper and stealthily makes for the kitchen. And so it goes. The Home has been endangered by these instruments ever since the "Pup first heard His Master's Voice," and you know it.

It's a "Noiseless Phonograph" that's needed, and as usual I have to invent it—nobody else will waste the time. Sometimes I get almost discouraged raking around after the big inventors and clearing up the poisonous by-products they leave. Everything falls on Patsy Bolivar. However, here's your new phonograph, not only *inaudible* except to the persons who want to hear it, but one that you can make yourself with hardly any trouble. With this and the prohibition law in operation, I feel as tho the Home might straighten out and survive for several years.

This machine has become possible, in a practical sense, only lately, thru the invention of the Skinderviken transmitter-button, a complete transmitter in itself; and right here I sure won't object if Mr. Skinder makes one simoleon on his part of the rinktum, because he advertises in our "Mag." like a regular fellow, and will sell you a single button if you want it.

Fig. 1 shows the general layout. For the whirling table, take one of these round shallow tin pans they use for baking Washington-pie sections — or strata, I guess you'd call 'em. The Five and Ten 'll have 'em. Take some pains to fix it true on the spindle.



The spindle runs in holes thru two brass elbows. At the lower end, to reduce friction, point it off and have it bear on a piece of glass.

As the transmitter-button is so much lighter than the ordinary reproducer, the pressure of the needle on the record will be negligible, so you won't need a governor. Your battery motor will run it evenly enough, and the speed is regulated by your rheostat.

Fig. 2 shows the method of attaching the needle to the front stem of the button.

Fig. 3 shows the short arm for perpendicular play and method of attachment to the back stud of the button.

Of course it's understood you can connect up as many receivers as there are folks who want to listen. But say—if any fellow starts to laugh at you or me for our "silent phonograph," just remove the gentle little receivers altogether and hitch on a couple of audion amplifiers from your old wireless set, then sick "Poor Butterfly" on that critic, magnified up till he'll think the pretty creature is a night-flying airplane with a ton of bombs on its chest. Oh! Boy!

Well—Fellow Constructors—Here's the Original "Noiseless" Phonograph. First You'll Need One of Those Transmitter Buttons That's All the Rage Now-a-Days. You Stick a Needle Holder On Said Button, Rig Up a Pie Tin Turn-Table, Hook Up a Battery and 'Phone to the Button, and Let 'Er Go!

www.americanradiohistory.com

Automatic Bell-Ringing Attachment

By T. A. NEELIN

THE present diagram illustrates a simple home-made attachment for an ordinary eight-day clock, for the purpose of automatically ringing a bell or working a relay at certain fixt times. It was primarily designed for use in a small

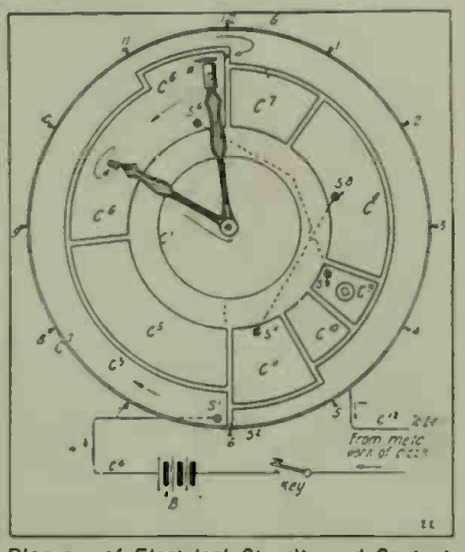
The Clock Fitted with Automatic Electric Bell-Ringing Switch. This Arrangement Has Given Entire Satisfaction in a High School for Some time, and Provides 18 Rings Between 9 A. M. and 4 P. M.

high school where it was not thought desirable to purchase an expensive clock especially designed for that purpose. The clock in question has given entire satisfaction and rings at intervals of about 35 minutes with intermissions of three minutes between periods, making some 18 rings between 9:27 a. m. and 4 o'clock p. m. An attachment constructed according to the enclosed diagram should cause the bell to ring at the following times: 8:55, 9, 9:55, 10, 10:55, 11, 11:55 and 12 noon; 1:25, 1:30, 2:25, 2:30, 3:25, 3:30 and 4 p. m. The accompanying photograph shows the clock as it is in use at the present time.

CONSTRUCTION

A wooden disc bounded by the inner and outer circles c^1 and c^2 was cut from whitewood and finished to about 3/8 of an inch in thickness. A copper strip of the form c^3 was then cut and attached to the wood by means of a screw at s^1 and a coating of shellac to hold it in place in the other parts. A narrow slit s^2 just wide enough for insulation purposes, separates the ends of this strip. The screw s^1 serves to connect the bare end of an insulated copper wire c^4 to the copper strip c^3. This wire connects to one pole of the battery B as shown. Copper plates of the form c^{11} c^5 c^6 c^7 c^8 c^9 c^{10} were next cut and in c^6, c^8, c^9, c^{11} holes just large enough to admit a 3/8 inch screw were bored. Corresponding holes were bored in the wood disc. The copper plates were then laid down in shellac and insulated from each other by narrow spaces as shown; c^6 and c^9 were connected by a wire attached by means of the screws s^6 and s^7, and passing behind the wood disc; c^8 and c^{11} were similarly connected. The dial was then removed from the clock and the disc inserted in its place. The hands were next prepared.

To the outer extremity of the hour hand was attached a little brush made of fine strands of copper wire obtained from a piece of "lamp cord" and bound tightly about the hand. The hand was then adjusted in place so as to press the brush evenly on the surface it past over. A small brass wheel w^1, say 5/16 of an inch in diameter rotates freely and smoothly on the pin which fixes it to a piece of wood as shown. Into the other end of this piece of wood the outer end of the minute hand was inserted. The object of the wood was to insulate the minute hand from the wheel. The minute hand was then curved upward in the middle to allow the whole to freely pass over the hour hand while at the same time the curved minute hand acts as a spring to hold the wheel firmly against the copper parts beneath. The minute hand was then put in place; c^{12} is an insulated copper bell wire attached from the rear to the metal works of the clock, and continuing to the bell, or relay if a number of bells are to be worked at the same time, and thence to the battery B.



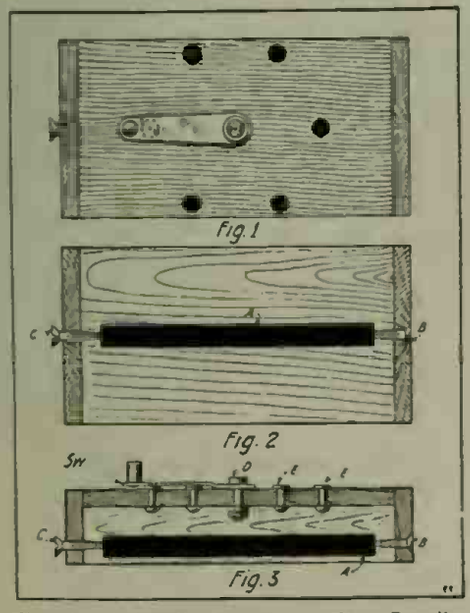


Diagram of Electrical Circuits and Contacts Fitted to Hands of Clock for Ringing One or More Bells at Different Hours.

ACTION

From the battery B the current may be thought of as travelling thru the wire c^4 to the copper plate c^3. As soon as the wheel w^1 bridges the gap at G the current can then pass to c^6, thence thru the brush and hour hand, the works of the clock, thru the wire c^{12} completing the circuit and thus ringing the bell or working the relay. In a few seconds the circuit is broken again at "G" by the minute hand moving on, and the bell stops ringing. The wires shown by the dotted lines are necessary to get the current from the hour hand to the proper plates so that the bell may ring at the times indicated.

A "Lead Pencil" Rheostat

The Lead-Pencil Rheostat. The Pencils, Without Rubber Erasers, Are Supported Between Wood Screws, as Shown. Proper Wire Connections Being Made Between the Switch-Points and Screws.

The accompanying drawing shows a lead pencil rheostat. The idea is new and very simple at the same time. The lead pencils used are in no way spoiled and can be taken out of the frame and used as if new.

Fig. 2. A, is a pencil (a drawing pencil) which has the lead exposed at both ends. B is a screw which is flush with the wood, F, and makes connections with a wire not shown. C is another screw longer than B. D, E, E are the parts of a switch.

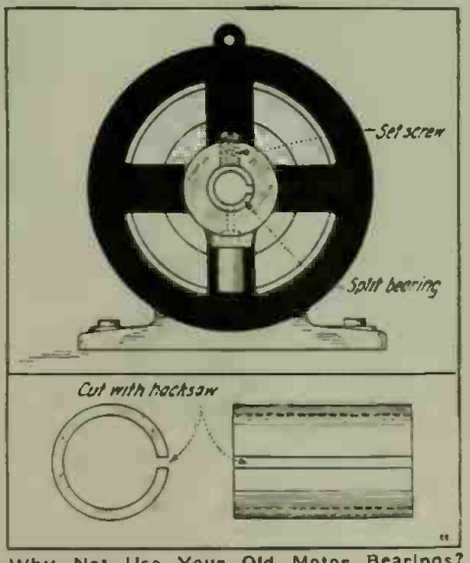

Fig. 3. It shows the switch side of rheostat. The pencil, A, is set between screws B and C. Screw C is screwed down until the both screws make good connections with the exposed lead in the ends of pencil. Connect wires with the screws, connect the wires in the right place on the switch. The number of pencils used and their length will determine the size of the rheostat. It is best to use good drawing pencils as their resistance is higher.

A HEAVY DUTY 110 VOLT, 60 CYCLE STEP-DOWN TRANSFORMER.

BY RAY SEITZ

With this article I intend to fill the want of the experimenter for a good and efficient transformer.

The first step is to make the core. From a piece of black sheet iron cut enough

A 250-Watt Step-Down Transformer for Use in the Laboratory, in Cautery Work, and General Experimental Work.

strips 5" long 1½" wide to make a pile 3" high and 3¼" long and 1½" wide to make a pile 3" high. Now build four cores like those shown in Fig. 1, two from the the larger size and two from the small size strips. When you have done this clamp tightly in a vise and wrap well with three layers of good friction tape. On the long legs wind three layers No. 12 D. C. C. copper magnet wire, 30 turns to the layer, taking a tap off at each layer. The two legs will require 2¼ pounds of wire. Now wrap two layers of good friction tape over this and begin winding the primary which consists of 6 layers No. 22 S. C. C. magnet wire, 80 turns per layer, using a layer of paper between each layer of wire. This winding, the primary, will require 1½ pounds of No. 22 S. C. C. magnet wire. After you have both of the legs wound wrap again with two layers of friction tape and paint the whole heavily with shellac and bake in an oven for three hours. Now put the four legs together and drill a hole in each corner to pass a ¼" bolt A*B*C*D—Fig. 2.

After the holes are drilled, the next thing to do is to solder the taps on with short pieces of No. 12 R. C. wire and brought to their proper binding posts. No. 1 comes from the beginning of secondary winding, No. 2 from first tap, No. 3 from second tap. No. 4 from end of winding on first leg, (end of winding on first leg and beginning of winding on second leg are joined together, and tap 4 also comes from this joint). No. 5 from first tap on second leg. No. 6 from second tap on second leg, No. 7 from end of winding on second leg.

When connecting the ends of the windings together care should be taken to see that they will help each other along and not "buck" each other. By applying the hand-rule for electro-magnets you can easily figure which ends have to go together. The primary sections are connected up in series with each other, applying the hand rule as in the case of the secondary and the two remaining ends are spliced to a piece of black extension cord for connecting up to the supply. The hole, 8, in Fig. 4, is for this piece of extension cord to go thru, having first bushed it out with a piece of fiber tube from a 30 amp. cartridge fuse.

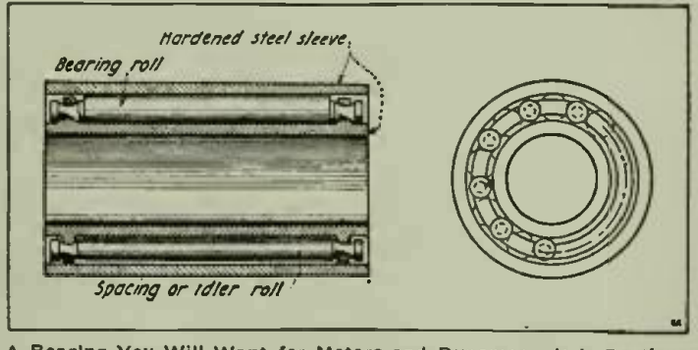
The top is made from a piece of ½" red birch, cut to the dimensions in Fig. 4. The holes marked 1-2-3-4-5-6-7 are for the binding posts and 8 for the connecting cord. The other holes are for fastening the transformer to top. When fastening transformer to top, four pieces ¼" gas pipe 1½" long, will separate the core at the right distance from the top.

Fig. 5 gives the dimensions and shows how to cut the sheet for making a box to fit the transformer. It is made from 24 gage sheet iron, having the corners riveted together.

Short-circuits and heavy overloads will not harm this transformer, if not left on for too long a time. This transformer, if built the way described, will work perfectly and is absolutely noiseless at low load and at full load produces a slight hum. It consumes about five watts at no load and draws about 250 watts at full load. The secondary has six steps of three volts each, three volts between each terminal. This transformer is designed to operate on the standard current of 110 volts 60 cycles. The writer has built several of these transformers and they work to perfection under many different conditions.

A NEW WRINKLE IN ROLLER BEARINGS.

Most machine bearings are made of the ring-oiling type, that is, the bearing is supplied with a reservoir for oil, into which dip one or more rings that run upon the shaft, and thus supply the journal continually with oil. During the operation of the machine there is a continuous flow of oil thru the bearing, which not only keeps the shaft well lubricated, but tends to wash away any particles of metal that may be worn from the rubbing surfaces.

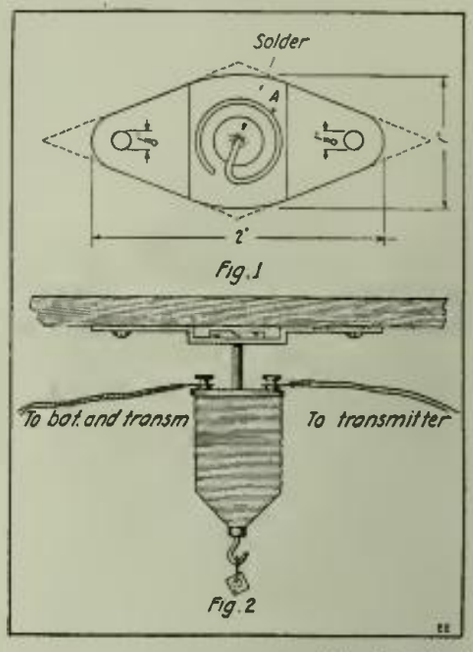


In a dynamo, it is important that the oil from the bearings should not follow the shaft and run out on the armature. The oil itself is not so injurious, altho it tends to destroy the insulating varnishes, but it causes an undesirable accumulation of dust that may greatly impair the insulation.

The accompanying diagram shows a new type of roller bearing, so designed as to run without the use of any lubricants. It is as simple as it is efficient.

This bearing consists of an outer hardened-steel casing and an inner hardened-steel sleeve. Between these are placed two sets of rollers of two different sizes, the smaller serving as the spacing or idler rollers and the larger being the essential bearing rollers. The relative position of these rollers is shown in the sectional sketch. The idler rollers are so designed to run on what may be called a *track*, and are held loosely in place by two retaining rings.

The bearing is suitable for all kinds of work. When used in connection with line shafting, the outer sleeve fits into a shell, held in place in the hanger in the usual manner.



Contributed by
PETER J. M. CLUTE, B.Sc.

A Bearing You Will Want for Motors and Dynamos. It is Particularly Strong and Runs Without Oil or Other Lubricants.

THE "TALKING TABLE."

If the apparatus here described is fastened to the under-side of a dinner table it will set the table in vibration so that any

An Entertaining Wrinkle for the Electrical "Bug" to Try Out—the Talking Table. The Magnet Connects Up with a Microphone and Battery.

number of persons putting their ears flat upon the table, will hear a person talking over the 'phone, if it is connected up as shown in the accompanying sketch.

A small piece of sheet brass is cut as shown in Fig. 1. A piece of soft iron wire, such as that used for cores of induction coils and about 6 inches long, is bent at one end as indicated at (A) Fig. 1 and put thru a hole in the center of the brass plate; the other end is bent into the form of a small hook. Next cut off about 2 inches of a cheap lead pencil and soak it in water till the lead will come out easily, then glue the pieces of pencil to the wire just above the hook. Take a piece of cigar-box wood and cut a piece about 1⅜ inches in the center so it will fit over the leadless pencil on the wire, and 2 holes to receive the two binding posts, Fig. 2. Glue the disc over the pencil on the wire near the upper end. The binding posts are then placed thru the other two holes. The pencil is now wound with No. 24 B. & S. silk or cotton covered wire, the end of the wire being fastened to the two posts. A small weight, weighing about two or three ounces, is hung on the hook. The apparatus is then screwed to the under side of the table and connected up to a microphone and battery.

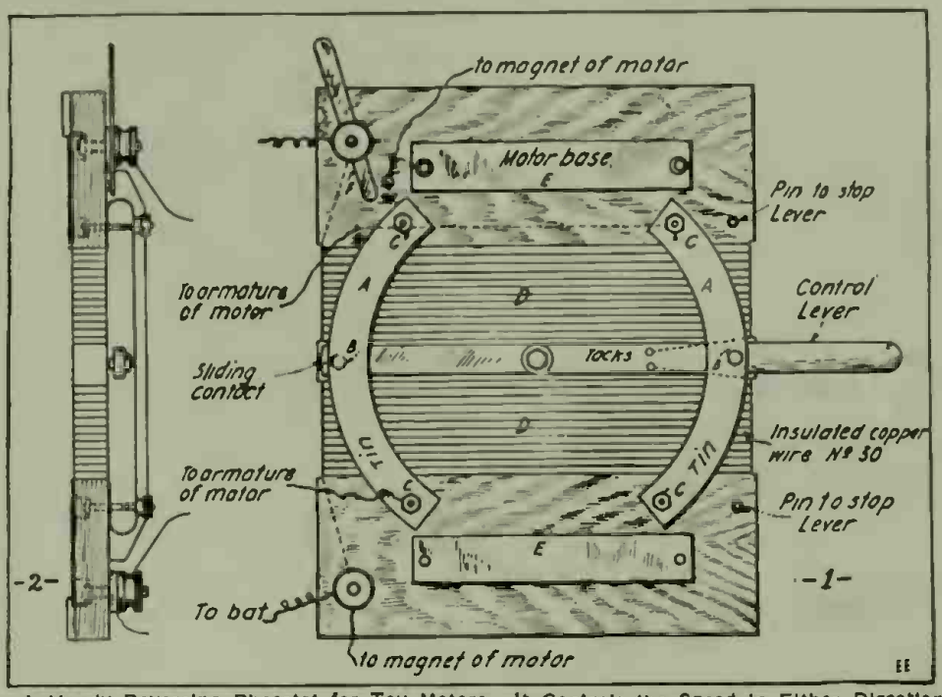
A PHOTOGRAPHIC PRINTING BOX.

The inconvenience of the printing frame is entirely done away with in this electric printing box. In regard to time the saving is enormous. The necessary material required follows: 1 piece wood 1"/12"/17" (base); 2 pieces wood 1"/12"/15" (sides); 2 pieces wood 1"/12"/12" (ends); 2 pieces wood 1"/6"/17" (top-hinged in the middle); 1 piece glass (plate) 15½"/10½"; 4 tungsten lamps; 1 ruby lamp; 5 sockets, and 1 lamp cord with plug.

The box is assembled as shown in the figure. The sockets are screwed 2" up from the bottom on the ends and are 5" apart. One socket is put in the middle for the ruby lamp. The next step is to wire the sockets according to the diagram, leaving enough wire to go over the top for the automatic switch which now will be taken up. The object of this switch is to turn on the four white lights when the lid is down. It consists of an L-shaped piece of spring brass or phosphor bronze that is screwed to the cover and fits into a V-shaped piece of metal when the cover is down tight. A piece of wire about 2' long runs over the top to the L-shaped switch. The other side can be wired up from the inside of the box.

The remaining step is to put on the glass plate. The glass should be as heavy as possible; plate glass is the best. There is often quite a heavy strain on the plate from printing and consequently a light glass is liable to crack. The top of the box is now rabbited out ¼" deep and ¼" wide from the inside all around, so that the glass will fit in flush with the top. The top is hinged in two places in the middle opening, and two more places on the end to give no play at all to the cover. It is well to cover the inside of the top with a piece of cotton flannel the size of the glass plate. This insures that the negative will be in firm contact with the printing paper.



Amateur Photo Printer Provided with Automatic Switch for Opening and Closing the Light Circuit When the Lid Is Operated.

It is seen from the wiring diagram that the ruby lamp is kept burning all the time. This is to allow for printing masks to be adjusted, the negative to be arranged, etc. This printing box is capable of turning out prints at a rapid speed, doing away with the clumsy printing frame. It is very simple in construction and will repay anyone who constructs it.

Reversing Rheostat for Small Motors

This rheostat is built under the motor on a wood base 6 x 8 x ½ inches. On each side of the base, 2¼ inches from the ends, cut two grooves ⅜ inch deep and 1 inch wide, leaving a space of ½ inch between. Take about thirty-five feet of No. 28 insulated copper wire, fasten one end to a binding post under the base as shown in Fig. 1, and wind it around the base closely and evenly, gluing it near the place where the sliding contact, B, is to work. The final end of the wire is tacked to the lower side of the base. Wind the other side in like manner. The lever is a thin piece of wood ½ inch wide, carrying two short binding posts, B B, which serve as sliding contact points, connecting the arc, A A, and the coil, D, off of which the insulation has been scraped in the path of the slider, B. The nearer the glue is to this path the better.

A Handy Reversing Rheostat for Toy Motors. It Controls the Speed in Either Direction and Can Be Actuated from a Distance by a String Attached to the Handle.

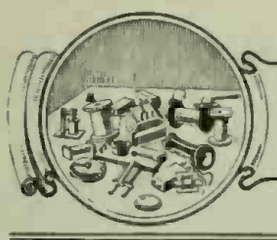
Revolution Counter for Dynamometer

Electric tachometers have not proven a success where accuracy is demanded such as in dynamometer testing work and therefore several revolution counting apparata have made their appearance on the market. These latter usually take the form of solenoid operated clutches operating in turn revolution counters. When the fuel-weighing apparatus makes contact, the clutch is engaged and a stop watch started. When the weighed quantity of fuel is used up the scale breaks contact, the counter is stopt and the stop watch stops. Thus an accurate method of determining *pounds of fuel per brake horse-power hour* is secured.

A "seconds pendulum" is a pretty handy piece of apparatus to have in any laboratory. I built such a pendulum so that at every swing the lower end of the pendulum would brush thru a mercury cup fastened on a suitable adjustable support. The requisites are one solenoid with laminated soft iron core, one old electric bell magnet, a circular saw, a few small gears and a little work.



The small brass drum attached to the saw has a piece of insulation in the path of one of the brushes whose length is sufficient to cover the circular distance of all teeth over thirty, so that there will be thirty movements of the saw or a time

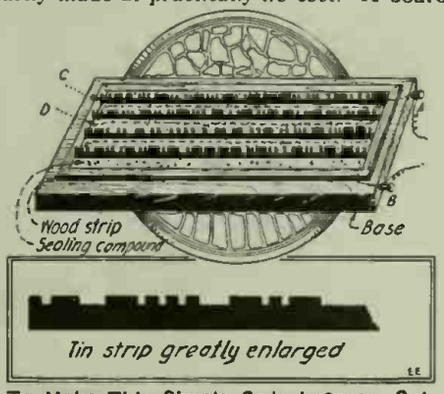
HOW-TO-MAKE-IT



This department will award the following monthly prizes: First Prize, $3.00; Second Prize, $2.00; Third Prize, $1.00.
The purpose of this department is to stimulate experimenters towards accomplishing new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best idea submitted a prize of $3.00 is awarded; for the second best idea a $2.00 prize, and for the third best prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings. Use only one side of sheet. Make sketches on separate sheets.

FIRST PRIZE, $3.00

A MANUAL TYPE CODE LEARNER.

I give below drawing of a "code teacher" which I am contributing to the "How to Make It" Department.

This code teaching instrument can be easily made at practically no cost. A board

To Make This Simple Code Learner, Cut Out the Dot and Dash Characters On Strips of Tin and Embed Them In Sealing Compound. The Buzzer Circuit Is Made and Broken Over These Projections.

(any size to suit the maker) has slits cut into it lengthwise with a knife or saw, as indicated. Tin or brass strips are procured, with a length equal to that of the board. The dots and dashes are cut out along the edges of the strips, as in the drawing. They are put in the slots, then connect all together with a wire. Then take some wood about ¼-inch square and put it around the edge on the top. Melt some sealing compound and pour it in the box just made by putting the wood strip around the board, to within ⅛-inch from the top of the tin. Then cut out a piece of tin to make the "pen;" connect it up to a buzzer or telegraph sounder and slide the "pen" across the tops of the tin strips, which makes the dots and dashes at any speed desired.

SECOND PRIZE, $2.00

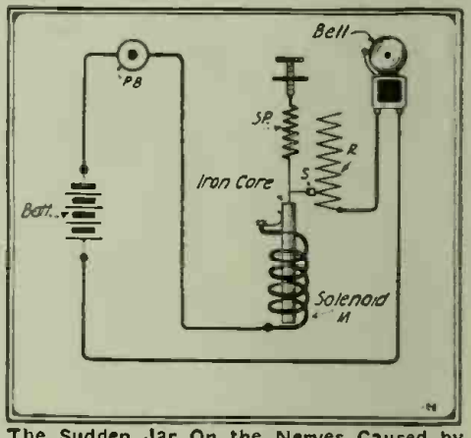
TAKING YOUR OWN "MUG" IN GROUP FLASHLIGHTS.

When taking group photos by flashlight it is often desired that everyone be in the picture, but as someone must hold the flash-pan and set it off at the proper moment, this is often impossible. I have a plan, which is explained below, which allows everyone to be in the photo.

In the diagram *a* is push-button held by photographer; *b* is spark coil, the wires from *a* being connected to the primary side of the coil, with set of dry cells in circuit; *c* is one wire, from secondary side of coil, which is taken thru hole in bottom of holder and soldered to *e*; *d* is other wire from secondary side of coil which is taken thru hole in back of holder *f* and turned down until there is a gap of about one-fourth inch between it and *e*; the covering should be removed from *d* for about one inch from end; *e* is baking powder can cover which should be securely fastened to holder *f* as shown; *f* is holder made of two pieces of

Push the Button and Take Your Own "Mug" with This Unique Electric Flashlight Scheme.

wood about six inches wide fastened together at right angles and covered on the inside with sheet asbestos, which acts as reflector and protects wood. Holder can be placed on either side of camera, but must be *back of camera.*



How It Works.—The operator puts the proper amount of flash powder in the baking powder can cover, in and around the point of wire *d*. He then arranges his group, using the camera finder for this purpose, leaving, however, a place for himself. The light in the room should be turned low, leaving only enough to see by. The camera shutter is now opened, the photographer takes his place in the group, and at the proper moment pushes the button. The spark between wire *d* and baking powder can cover sets off the powder, after which the photographer closes the shutter, and the picture has been taken.

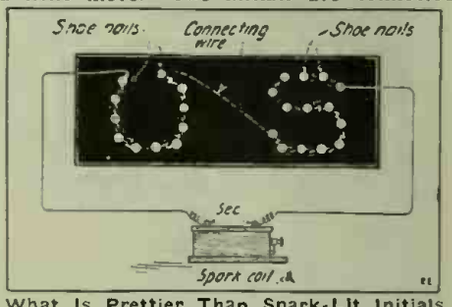
THIRD PRIZE, $1.00

A PROPOSED "BELL SOFTENER."

When some one comes to the door and rings the bell, its sudden sound scares

The Sudden Jar On the Nerves Caused by Ringing the Ordinary Bell Can be Obviated by Inserting a Solenoid-Controlled Rheostat In Series with the Bell and Battery.

everyone. With this device it starts softly and gets louder gradually. The apparatus used is the same as generally employed for this purpose with the exception of the softener, which is a large cylinder wound with resistance (R), which is entirely in circuit at the start, but is varied by the slider S. When the key PB is released, the slider is pulled back to the original position (having been pulled down by the magnet M) by the spring SP.



CAUTION: Do not have the slider too far from the magnet; make the cylinder short but large in diameter. Do not use too much resistance; allow enough current to pass so that the magnet will work.

ERNEST INNES and ETHBERT REED.

SPARK-LIT INITIALS

I here give a description of spark-lit initials formed from old shoe nails, driven into a block of wood so as to form letters.

A piece of wood ¾" x 1½" x 3" is used for the base, initials one inch high are drawn on the base and the shoe nails are driven into the initials about 1/32" apart, or a little more. The initials are connected

What Is Prettier Than Spark-Lit Initials Such as These, Which Can be Lit Up by Even a Small Spark Coil.

together as shown and wires are connected from the secondary terminals of a spark coil to the letters. When the coil is excited, sparks jump from nail to nail, lighting up the initials in a very pretty way in the dark.

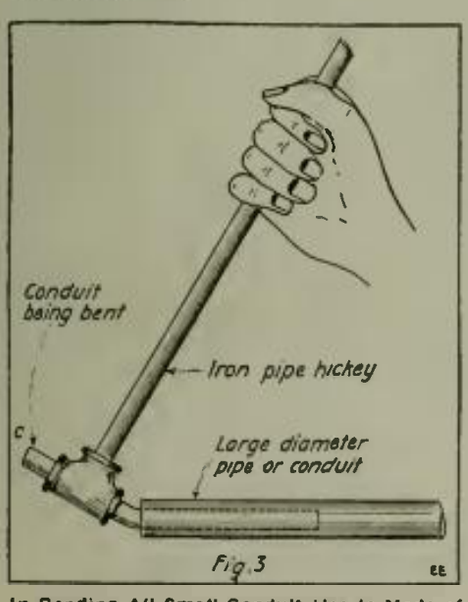
METHOD OF FORMING A SHORT-RADIUS BEND IN CONDUIT.

By George W. Shirley

To make a short radius bend in conduit for a location such as that indicated in Fig. 1, the method to be described can be used. Where turns of the usual radius are



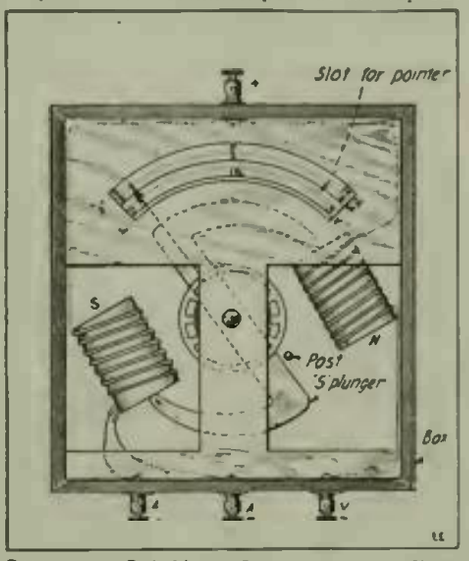
Above: The Electric Conduit Pipe Should Always Be Neatly Bent and Fitted In Place Like This. The Bends Must Be Even Curves, Not Kinked Bends.

Above Is Illustrated How Not to Bend Electric Conduit. Such Pipe Bends Soon Loosen, and Besides Present a Very Unworkmanlike Appearance. How to Bend Conduit Right Is Explained Herein.

made, the conduits do not lie close to the surfaces and present the undesirable appearance delineated in Fig. 2. But with this method, bends of the approximate form diagrammed in Fig. 1 can be so made that the inner face of the conduit will lie not more than 1¼ inches from the faces of the beam. A sleeve, *P*, of a larger diameter than the conduit, *C*, being bent, is slipt over the end of the conduit (Fig. 3) and then the short-radius turn can be formed with a hickey, *H*.

The electrician uses what is known as a *hickey* for bending all small pipe curves. The hickey is nothing more or less than a substantial pipe *tee* fitted with a handle of pipe as shown in Fig. 3. The handle is threaded, of course, so as to screw into the fitting firmly.

In Bending All Small Conduit Use Is Made of What Electricians Call a "Hickey." This Is Made of a Short Length of Pipe Threaded Into a Heavy "Tee."



A Low-Reading Volt-Ammeter

Remove the balance wheel, bearings, and hair-spring from an old alarm clock. Using composition wall-board or thin wood, make a box 3x3½ inches and ⅞ in. deep. For ease in adjusting, the front should be cut away as shown, and the front should be easily removable. In the center, both back and front, bore a small hole to receive the bearing screws, which are cup-shaped in the ends. The balance wheel should spin freely when in place.

On a thin sheet of soft iron, taken perhaps from an empty tomato can, draw a circle with a radius of one and one-sixteenth inches. Inside this circle cut an armature like the letter S, as shown in the drawing. Punch a small hole in the center of this "tin" letter S, and slip on the balance-wheel shaft and fasten to it. Push the hair-spring on the shaft above the wheel. The free end of the hair-spring is secured to a small post. The spring must of course be adjusted to the proper tension. A thin pointer made of No. 32 wire is made fast to the balance wheel, letting the end project up thru the slot cut at the top of the instrument. A bit of colored paper should be glued to the end of the pointer.

Around a stick of wood half inch thick and ⅝ wide, wrap a couple of thicknesses of cardboard, gluing carefully. On this form wind one layer of No. 20 four feet. Fasten this with shellac. Over this coil wind 5 turns of heavier wire, say No. 14. For the voltmeter coil 40 feet of No. 32 may be used. This makes 200 turns and has a resistance of nearly 7 ohms. A dry cell giving 1.5 volts will send over 1/5 ampere thru this coil. 200 x .2 amp. gives 40 amp. turns, or 40 feet x .2 amp. equals 8 amp. feet. .2 amp. at 1.5 v gives .3 watt. When the ammeter coil having 20 turns or 4 feet is carrying 2 amperes it too will have 40 amp. turns or 8 amp. feet, and will exert the same magnetic pull as the voltmeter coil at 1.5 volts.

If we wish to measure a little higher voltage we may use 140 feet of No. 36 copper wire, having a resistance of 50 ohms. Now at 4.5 volts the energy absorbed will be nearly .3 watt. One watt should pull the armature or plunger the full distance into the coil. A square of paper covers the opening in the front and a glass fitted into slots excludes the dust. Each coil may be joined to a common post at the top but

Procure an Old Alarm Clock. You Are Then Ready to Start Building This "Triple Scale" Volt-Ammeter, a Most Useful and Desirable Measuring Instrument for the Experimental Laboratory.

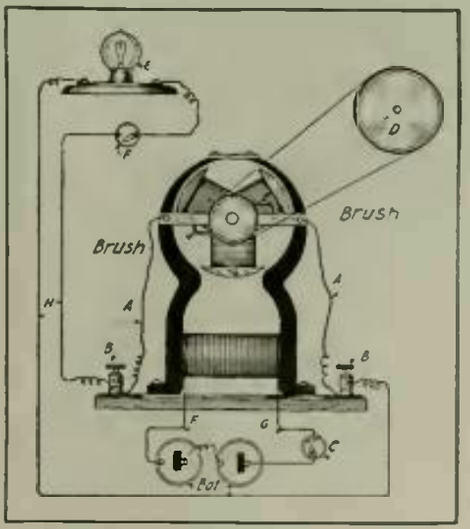
to a separate post at the bottom. Instrument will work in either horizontal or vertical position. Calibration should be done last. If no standard instruments are at hand, each dry cell in series adds 1.5 volts. For the ammeter scales, two cells in series will send 6 amperes thru 48 feet No. 20; one cell will give 3 amperes thru the same wire, and 1 ampere thru 9 feet of No. 32. My "battery tester" has been used often during the past year. Tester may be used for a moment on much stronger currents than examples given.

Contributed by H. H. DAVIS.

Converting Small Motor Into a Dynamo

If your motor is not already mounted on a base, it would be well to do so for this experiment. On this base mount two binding posts BB.

Then disconnect the wires which come from the field coil and connect them to two dry cells, as shown in the sketch. Connect two short wires from the brushes to the binding posts BB, the wires being indicated by AA. A switch may be put between the field coil and batteries if desired.



Now belt the motor to any large wheel, D, such as a fly-wheel of a sewing machine. A water motor serves the purpose very well.

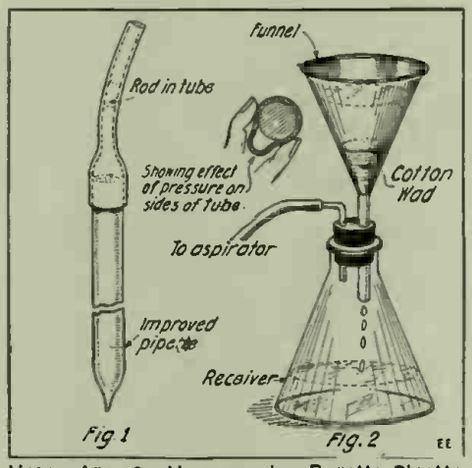
When the armature is revolved at a high rate of speed, current will be generated, which will pass thru the wires HH, connected to a small electric bulb, storage battery or to another toy motor.

In my case the motor was very small, only three inches high, designed to run on two batteries, and when converted into a dynamo it gave sufficient current to burn out a two and seven-tenths (2.7) volt bulb, which I had taken from a flash-light.

It must be borne in mind, however, that the voltage of a dynamo is controlled by the size and number of wires with which it is wound and the speed at which the armature is rotated, as well as the strength of the field magnet.

Contributed by E. L. DURGEN.

To Demonstrate the Principle of the Dynamo the Experimenter Will Find It Extremely Interesting to Drive a Small Toy Motor with a Steam Engine, a Water Motor, or Another Motor, and Exciting the Field by a Few Dry Cells. A Small Lamp Can be Lighted.

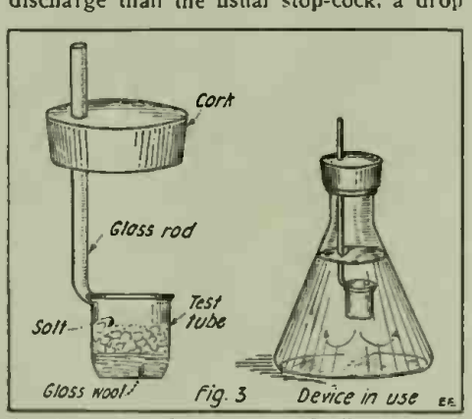


www.americanradiohistory.com

PRACTICAL CHEMICAL LABORATORY DEVICES.

By Thomas W. Benjamin.

THERE are many instruments and operations in chemistry that can be so improved as to make them handier or to shorten the time required for a given



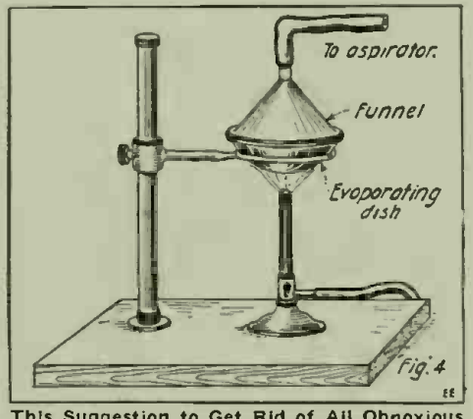
Here Are a Home-made Burette-Pipette and a Vacuum-Filter of Simple and Ingenious Construction Welcome in Every Laboratory.

process. Many of these are in everyday use in large laboratories but the experimenter hears but little of them.

A form of burette, or more properly a pipette, having several advantages is shown in Fig 1. Instead of the usual form with the stop-cock at the bottom, a plain graduated tube is fitted at the top with a 6-inch length of rubber tubing. The valve in this case is made by sliding a short length of glass rod into the rubber tube, locating the same midway of its length. The tube is normally kept closed by this rod but a slight pressure on one side of the rubber will cause the tube to buckle out and form a channel thru which liquids or air can flow.

The device can be filled either by sucking the fluid up into the tube with the mouth or by immersing it into the fluid with the valve open and removing after the valve is closed. This valve will give a finer regulation of the discharge than the usual stop-cock, a drop

An Automatic Saturator Is Easily Made as Shown in Above Diagram and May Come In Handy.



at a time or a steady stream being readily attainable.

VACUUM FILTER: When filtering thick fluids the process may be speeded up by the use of a vacuum filtering device. To create the vacuum, use can be made of the glass aspirators which are procurable at a very reasonable price. To use this for filtering, the receiver is fitted with a cork having two holes. One, large enough to take the spout of the funnel, the other having a short glass tube inserted. See Fig. 2.

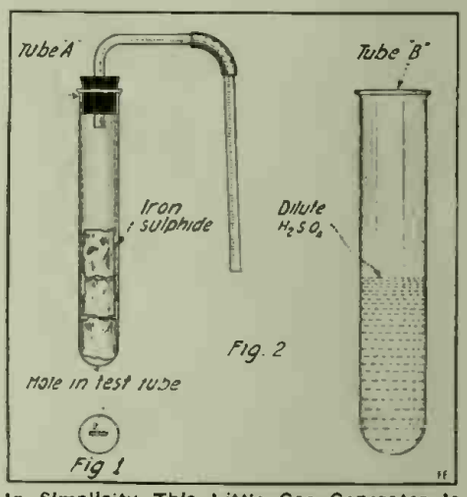
A wad of absorbent cotton is placed in the bottom of the funnel and reaching a short distance up the sides. This is to support the filter paper and prevent it breaking under air pressure. The bent glass tube is connected to the aspirator and when the water flow is started a slight vacuum will exist in the receiver. Any liquid poured into the funnel will be filtered at a rapid rate due to the air pressure forcing it thru.

SATURATED SOLUTION APPARATUS: Saturated solutions of salts can be more quickly made by supporting the salt near the surface of the liquid. The idea being that as the salt dissolves the fluid gets heavier and sinks to the bottom, being replaced by other fluid. This circulation is automatic and continues till the saturation point is reached.

A little device, easily made of glass, that can be used with all chemicals is shown in Fig. 3. The body is made by cutting a two inch length from a large test tube and bending in the edges at the cut by heating till soft in a Bunsen flame. A wad of glass

This Suggestion to Get Rid of All Obnoxious Fumes in the Small Laboratory Is Certainly Meritorious and Shows What a Little Ingenuity Will Attain.

wool is placed in the tube, being held in place by the turned-in edge. The glass rod used to support the device is fastened in place by heating the rod and tube where they are to be joined until soft and then pressing them together. A cork fitted over the rod will support the device inside a bottle.



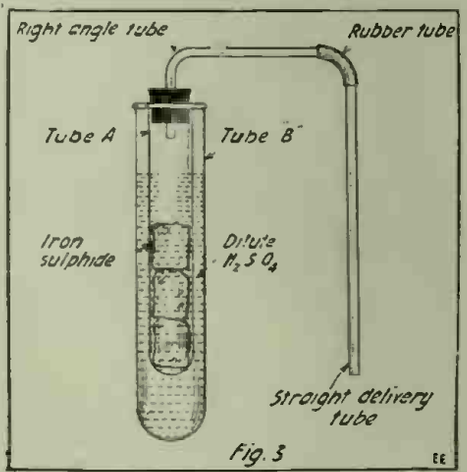
In use the tube is filled with the salt to be dissolved and placed in the bottle containing the solvent at such a height that the top of the tube is just below the surface. Additional salts may be added from time to time as found necessary.

The aspirator mentioned in connection with filtering can be used with advantage when drying or evaporating. In this case the evaporating dish is covered by a funnel the spout of which is connected to the suction tube of the aspirator; see Fig. 4. The vacuum created will draw off all fumes and vapors at a rapid rate. Should the vapor be required for further experiment a condenser can be connected in the line between the funnel and the aspirator to condense the vapor.

A SIMPLE GAS GENERATOR.

Frequently small quantities of gas are desired in the chemical laboratory, and no convenient and simple method of generation can be found. The apparatus described is very simple, yet it serves the purpose admirably.

First, procure two test tubes, one having



In Simplicity This Little Gas Generator Is Undoubtedly Unrivalled. Two Test-Tubes, a Cork, Some Rubber and Glass Tubing—That's All!

dimensions approximately 5/8" x 7" long, the other approximately 7/8" x 10" long. In the bottom of the smaller test tube file a small hole with a triangular file (Fig. 1), into this test tube fit a one-hole rubber stopper. Fit stopper, with a right angle, connecting tube, and straight delivery tube, as in Fig. 2, and insert in smaller test tube. The smaller tube A, is inserted in the tube B, the flare of tube A prevents it from slipping thru to the bottom of tube B.

In operating: If H_2S is to be generated, a stick of FeS, iron sulfid is placed in tube A, and the cork inserted. Dilute sulfuric acid is put into tube B, filling it about two-thirds full. When tube A is inserted into tube B, a large volume of gas is produced.

If hydrogen is wanted, small clippings of iron or iron filings are put into tube A.

The Gas Generator Ready Assembled for Business. Get the Gas-Mask, Archimedes!

and lowered into the dilute acid in B. Removing tube A stops the generation of gas.

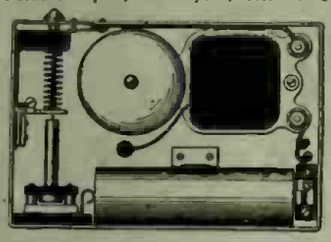
LATEST PATENTS

Electric Device for Raising Sunken Ships.

(1,288,108, issued to Vladimir V. Messer.)

In this novel scheme for raising sunken ships, a number of large floating members or tanks are utilized, which are provided with suitable electric-motor driven propellers

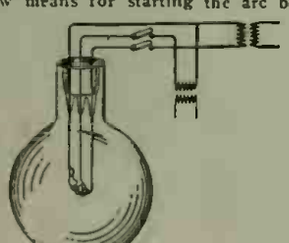


on the interior, for the purpose of causing the float to rotate in the water either in one direction or the other, about its axis. By means of flexible insulated conductors leading from the salvage boat to the float, the motors may be properly controlled, and current supplied to them for their operation. The dependent cables at the bottom of the float are made fast to the sunken vessel, by divers or by other means. These cables can be let out or reeled up by causing the float to rotate, and the cables wound up or reeled off from differentially grooved drums rigidly mounted on the exterior of the float.

Safety-Chest for Valuables.

(No. 1,291,051, issued to James L. McQuarrie.)

By means of an ingenious safety chest, a continuous alarm is sounded in the event of any unauthorized disturbance of the chest. The alarm mechanism is entirely enclosed in a small separate compartment, which may be readily removed, when the chest is open, for repair, etc. The

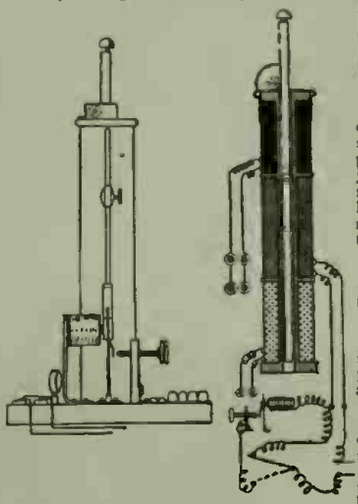


alarm is actuated by a gravity operated pendulum member, which is freely movable in response to any disturbance of the chest, once it has been set and the chest locked. Also magnetic means are provided for holding the gravity operated pendulum when it is thus moved by agitation of the chest, so as to keep the alarm bell circuit closed continuously.

Incandescent Arc-Lamp.

(No. 1,290,930, issued to Philip K. Devers, Jr.)

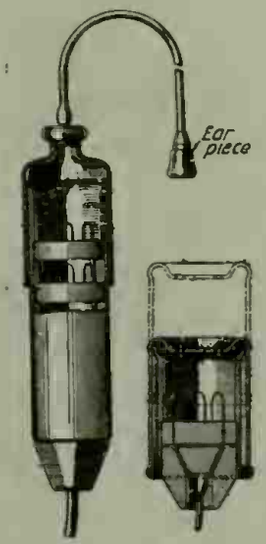
In this interesting form of incandescent arc lamp, the arc is operated between two electrodes of tungsten or other suitable material, in a gaseous medium of considerable pressure. The inventor provides a new means for starting the arc be-



tween the electrodes at low potential, while the electrodes are below a temperature at which the electron emission occurs. Surrounding the gap between the electrodes, there is provided a spiral heating coil, and the arc-supporting current is impressed across the electrodes at the same time that the heating coil is switched into circuit.

Medical Coil Apparatus.

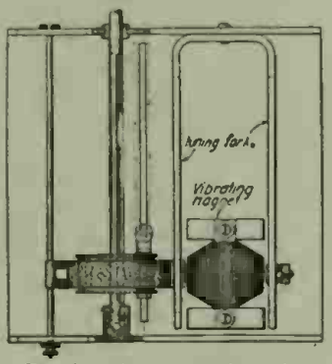
(No. 1,290,628, issued to Louis Mayor.)



Can be operated from commercial A. C. lighting circuits. There are three windings on the apparatus, one primary and two secondaries. One secondary is connected with sponge or other electrodes for applying the current, while the lower secondary coil provides a low voltage current for operating a small lamp for endo-

scopic work, etc. The soft iron core passing thru the coils is adjustable as to position, by means of a control knob fitted with rack and pinion attachment.

Adjustable Thermic Telephone.



(No. 1,290,114 issued to Picter de Lange and Robert Aeronut Baron van Lynden.)

An improved form of thermic telephone adapted for certain purposes, or wherever it becomes an object to accurately regulate the intensity of the sound reproduction by varying the volume of the sound chamber. In this particular arrangement the sounding chamber is arranged in two parts, so that one may be slid over the other, thus either lengthening or shortening the chamber.

Constant Amplitude Vibration Motor.

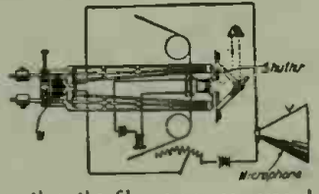
(No. 1,290,264, issued to Leslie R. McDonald.)

This ingenious motor is made up of a rotary member mounted on a square shaft, which is actuated or propelled about its axis by an adjustable belt member, which is alternately and regularly pulled taut and loosened, by virtue of its attachment to an electrical tuning fork in the manner here illustrated.

A Vacuum Tube Peak Voltmeter.

(No. 1,287,161, issued to Richard H. Wilson.)

An improved method for measuring the peak voltage between two points of an electrical net-work, and a further object of which is to measure a direct or alternating voltage without the necessity of constant calibration of the measuring instrument. These results are accomplisht by connecting the input circuit of the thermionic valve between the net-work terminals, across which the voltage is to be measured, and allowing the resulting uni-directional pulsating cur-

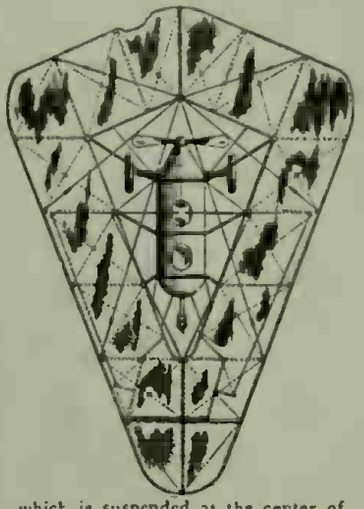


rent in the output circuit to pass thru a resistance or impedance.

Sound Recorder and Reproducer.

(No. 1,290,711, issued to Manuel Calderon.)

In "recording" the sounds on a photographic film by creating variations and graduations in light to dark, the sound waves are picked up by a microphone, or a battery of microphones. These microphones, thru a battery and rheostat, are caused to actuate an electromagnet, M. This magnet operates on two armatures attached to the pivoted levers shown, to the longer ends of which there are attached light beam shutters, which may enter the beam of light in the manner apparent. The variations as aforementioned in the light and dark graduations are photographed on the film, and correspond to the voice waves. In "reproducing" the voice, the film is past before the beam of light, and the variations in light value pass-

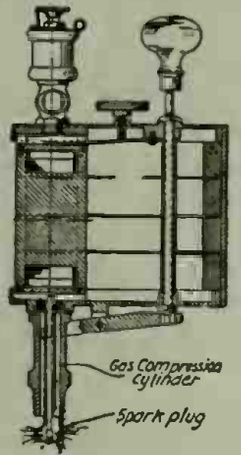


ing thru the film, cause corresponding variations in a battery and telephone receiver circuit, by virtue of their action on a selenium cell placed behind the film.

A Non-Capsizing Airplane.

(No. 1,284,373, issued to Platon Lazarides.)

The design of this airplane may be of the biplane type. The inventor provides a triangular form of wing, both of which are similar in shape and area, the center of the wings being open, so that the aviator can see upward as well as sideways and downward. One of the principal objects of the inventor is to provide a flying machine such that if the engine should stop in mid-air, it would then become possible for the airplane to settle to the surface of the earth in much the same way as a parachute does. This is accomplisht by carefully balancing the entire plane, and the ear or body

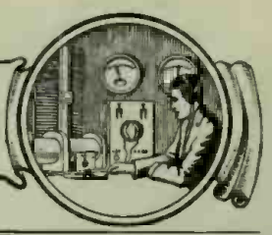


which is suspended at the center of the wings.

Spark Plug and Generator Combined.

(No. 1,290,190 issued to Albert B. Herrick.)

This interesting patent covers a very ingenious gasoline engine spark plug and generator combined, which is operated by the compression of the engine. In other words, this device includes an electro-magnetic generator similar in principle to a magneto which is adapted to be automatically operated by the com-



pression of the gases in the cylinder of an internal combustion engine. In the form shown, the generator constitutes but one coil wound on a soft iron core. This is surrounded by a series of strong steel magnets. At the base of the generator there is a threaded terminal which fits into the spark plug orifice of the gasoline engine, so that the compression can operate therein to push against the piston member.

WITH the AMATEURS

Our Amateur Laboratory Contest is open to all readers, whether subscribers or not. The photos are judged for best arrangement and efficiency of the apparatus. To increase the interest of this department we make it a rule not to publish photos of apparatus unaccompanied by that of the owner. Dark photos preferred to light-toned ones. We pay $3.00 each month for the best photos. Address the Editor, "With the Amateurs" Dept.

"Amateur Electrical Laboratory" Contest

THIS MONTH'S $3.00 PRIZE WINNER—N. NUSHAWG

HEREWITH are three views of my "Chemical Laboratory." I think it will be needless for me to give a description of the contents of my laboratory as I had the view so photographed as to cover that part. A brief outline or history of my laboratory I think would not be out of place. The "Lab." as you see it in the accompanying views is an accumulation of five years of experimental work. My first laboratory consisted of an old wash-stand, of which a part can be seen directly behind "yours truly" in the view in which I am standing. Year by year I added to the aforesaid wash-stand, as my finances would permit, until today I have what I consider a model "Amateur Chemical Laboratory."

My laboratory is not only a place which affords me much amusement but is also my "Study Hall" and my "College of Chemistry" combined in one. I maintain a schedule of study which embraces two hours each evening, including the study of chemistry, electricity, biology and other studies interesting to those contemplating a life of science.

Two articles which I would like to call to your attention, noticeable in the general view of my laboratory, are first: the electric furnace constructed from the description found in the April, 1918, issue of the ELECTRICAL EXPERIMENTER. This furnace will be found on the ledge below my apparatus shelf in the right hand side of the picture. The other article is the hydrogen sulfid generator, which will be observed beside my specimen cage just beneath the window (to the left). I am sending a separate description of this apparatus to the Editor, hoping he will see fit to publish the same in "your magazine"; so keep an eye peeled for it.

This laboratory is located in the cellar of my home and is twenty-two feet in length and fourteen feet in width. It is constructed of plaster board and has a four inch air cushion around it on three sides, so as to protect it against any dampness from the cellar. It is heated by a furnace pipe that you will notice running thru the laboratory. It is fitted with electric lights for general illumination and a gas lamp for use in the printing of photos. I have gas and running water at hand. A hood is also among the apparatus; this serves in eliminating all obnoxious odors.

I have been taking the ELECTRICAL EXPERIMENTER since the August issue of 1915, and have each copy since that time. I find it to be the best magazine in its field and have highly recommended it to my friends, gaining the "E. E." quite a few friends by so doing. I have found the "Experimental Chemistry" course by Albert W. Wilsdon very interesting, having followed and studied each lesson since the first.—N. Nushawg, 534 Arbor Ave., Dayton, Ohio.

Science in Slang

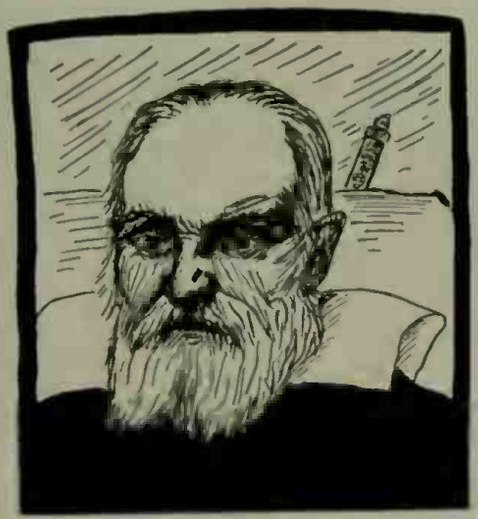
3. The Specks in Space

By EMERSON EASTERLING

T was one of those clear bright summer nights when the moon and stars stood out against the black background of the sky, casting a silvery light upon the faint landscape. We were motoring along a highway, and as the sky loomed out as the cynosure of the time, our conversation drifted to astronomy, being of the scientific trend, and our company being more or less scientifically inclined. Pointing to the moon, Stokes made the remark, "Old girl, since Adam quit rubbing his eyes and became aware that he was a sentient being your reflections have permeated space and we have become familiar with your lunar highness. Lovers have sworn their LOVE by you, and coyotes have howled under your rays. But not until the spectroscope shows up and dissects the moon beam, laying its vibratory secrets bare before us, we were not so sure after all but that you were green cheese, as the story book affirmed.

"The old time Chinks were the first guys to finger around and get on to the ways of the welkin—in fact they looked right thru the welkin and got wise to such things as eclipses and other primary stuff of the great all-around. It was reported that two old timers named Hi and Ho who profest to be 'there' on the astronomical dope failed to inform their boss, the Emperor of Cathay, of the eclipse that came around unannounced, and it is further stated that according to the regulations of the country, the men were forced to suffer the amputation of their heads.

"Next in order came the Chaldeans, who claimed to be wised up on the aerial phenomena, and who were able to predict eclipses and so forth. They blew their horn and left some records that are real amusing and historically instructing, but they started the ball so that we hear from such guys as Thales, Anaximander, Pythagoras, Anaxagoras and Eudoxus, Hipparchus, Meton and a few choice more astronomers and not from other lines—of course we have heard from some of the birds in other lines, but as a whole they were star gazers and dreamers.



"Then we read of the endeavors of the Egyptians, from the school at Alexandria, and of Ptolemy and his ideas. You know he was the duck that was guilty for the Epicyclic System, which has it down in such a manner that the believer is led to accept the statement concerning the revolution of the planets around a center that is itself doing the merry-go-round stunt. From his standpoint he was right—the only trouble with him was that he overlooked, while gazing so far into the heavens, that our little elongated spheroid was one of the ethereal company in motion with the rest. But the old boy unhitched the old plugs with which Apollo had pulled the old glare around and run the brow wrinkles in other directions when he let loose with his treatise 'Almagest'. All this was way back in B. C. about 200.

"On astronomy, and more so on astrology, the Gypsies were 'there', but to the Greeks we owe the coining of the word 'ASTRONOMY', from the word *νόμος*, or nomos, which means LAW; and *αυγρου*, or astron, which means star or + we get the same which means Star-Law. From the Greeks spring Thales, the man who stands out in the first discoveries of the electrical phenomena, and who was so good at the heavenly twinklers that he was termed the Father of Astronomy. It was him and not Chrissy Columbus that told the World in general that the globe that we now know as the 8,000 mile in diameter ball of dirt and water (which is not necessarily mud) was round instead of a flat chunk upon the shoulders of Atlas. It was he who determined when the equinoxes and the solstices were due to arrive, and he knew beforehand when the famous eclipse of the Sun was to occur—the one that caused the Lydians and the Medes to throw up the sponge in their famous battle, you've read of the incident in history. Then the sundial was invented by a Greek, Anaximander.

"Getting back to the history of the thing we see a poor guy gazing up thru a dilapidated old farmhouse roof—where there was no roof—and thinking. Well, he thought so hard that we now still read of the Copernican theory of the universe. He stuck our planet in with the rest of the whirling globes and fireworks. He got a hunch from Pythagoras.

"Brahe then came along and modified the theory of Copernicus and cut out the 'cycles and epicycles' stuff, and as he was not housed up in a farmhouse he built a magnificent observatory. Then came the apt pupil of Brahe's, Kepler, who compounded a pile of laws and stamped his cognomen on history,

"After a while Galileo grew up from the skipping rope and marbles age and invented the telescope and pendulum. Looking thru the glass instrument he found that Jupiter had a moon—not the kind that showed up when some of his marbles collided with too much force, tho. After he slipt us a handful of physics and astronomy and the like we become aware that from the dressing room of Life there steps out a Sir Isaac Newton, who saw the apple fall and told us all about gravitation. Of all the 'Big Bugs' in astronomy, as well as mathematics, we lift our hat a little higher to Ike."

Galileo, the Bird Who Defied the World by Telling It that It Turned Around Instead of Standing Still, as Was Thought.

"I once read of the Arabians as being up on the Astronomical dope," I ventured.

"Yes, they were," Stokes replied. "A duck by the name of Ulugh Beg, who was not an ugly beggar but an astronomer, catalogued a bunch of stars. They took to that and astrology, like the Egyptians and Moors.

"Then Laplace topt off Newton's 'Principia' with his *Mécanique Céleste*.

"Naturally, the first thing to be considered is the Sun. The savages recognized it as the means of life on our planet (of course they knew of no other) and worshipt it as their God, in the same manner as we do the $, only they openly acknowledged it. In plant life we are aware of an attraction by it. Only the blind cannot see the effect it has upon everything in general. Now, with a lot of the experiments behind us, we have it figured out that we are 93,000,000 miles from Old Sol, and that the hot old

Ike Newton, the Gink Who Invented Gravitation by Means of the Cider-Fruit.

boy is composed of much the same material as our Earth, and we also have it doped out that the temperature up at the Sun arrives at the twelve thousand mark, F. It has a 'photosphere' where we have our hydrosphere and a 'Chromosphere' where we have our atmosphere. The mathematical wonders have it down in their note books as follows for the weights of the Earth and Sun, respectively: 6,000,000,000,000,000,000,000 and 2,000,000,000,000,000,000,000,000 *tons*. To reduce that down to ounces would take Steinmetz at least a second—you know him. Then the candle-power looks like this on paper: 1,575,000,000,000,000,000,000,000,000,000."

"How would you say that if you did not have your pencil along" asked Bender.

"Well, the first, replied Stokes, looking down at his paper, "is six sextillion. The

THE ORACLE

The "Oracle" is for the sole benefit of all electrical experimenters. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be published. Rules under which questions will be answered:

1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered.
3. Sketches, diagrams, etc., must be on separate sheets. Questions addrest to this department cannot be answered by mail free of charge.
4. If a quick answer is desired by mail, a nominal charge of 25 cents is made for each question. If the questions entail considerable research work or intricate calculations a special rate will be charged. Correspondents will be informed as to the fee before such questions are answered.

REWINDING TELEPHONE MAGNETO.

(993) Walter F. Hawley, Buffalo, N. Y., writes us:

Q. 1. How can he rewind a 3 bar telephone magneto to produce 10 volts?

A. 1. This question cannot be answered exactly, excepting on one condition, and that is that you would need a magnetomometer at hand with which to measure precisely the strength of the magnetic flux in maxwells per square inch of pole-face area.

We can suggest from our experience in this line, however, that the armature be wound full with No. 17 to 18 B. & S. gage S. C. C. or enameled magnet wire. This would be suitable for a potential of 8 to 10 volts. Of course, the voltage can always be increased by raising the speed, but naturally there is a limit to this, as the machine will not safely stand too high a speed.

A. C. SOLENOID.

(994) Stanley Dohrzynski, Cuyahoga Falls, Ohio, asks the Oracle:

Q. 1. For data on winding a small A. C. solenoid about 3 inches in diameter and 3½ inches long, with a ⅝ inch iron core.

A. 1. Unless such an A. C. electromagnet is very carefully designed, which would require elaborate calculations, and also unless it is carefully and very exactly built according to these specifications as computed, then the current taken will vary considerably from that calculated. Also in the case of the solenoid, with a movable core, the current will vary from a very high value when the core is just entering the coil, down to a certain minimum value, when the core is pushed all the way into the coil.

The only thing we can suggest in your case would be to experiment with several sizes of wire. For the size of solenoid you have in mind, you might try winding it full with No. 18 D. C. C. magnet wire. The weight which such a solenoid could lift with the core all the way in the coil would probably be in the neighborhood of one-half pound. The iron core must be laminated, not a solid piece.

1 K. W. WIRELESS TRANSFORMER DATA.

(995) J. R. Johnson, McConnelsville, Ohio, writes this department:

Q. 1. Please give data for winding a 1 K. W. radio step-up transformer.

A. 1. We are pleased to give you herewith data on 1 K. W. close core step-up transformer.

The laminated sheet iron core should measure 15 inches long and 8¼ inches wide, and have a cross-section of 2 × 2 inches, or 4 square inches. The primary winding which should have taps taken off from each layer should comprise 344 turns of No. 10 B. & S. gage D. C. C. magnet wire. The secondary should comprise about 12 pounds of No. 32 D. C. C. magnet wire, thoroly impregnated with paraffin and beeswax while being wound into pies. There should be 24 pies or coils, each ¼ inch thick. This secondary winding should give 14,176 volts with 300 turns in the primary; 21,265 volts on 200 turns in the primary, and 42,530 volts with 100 turns in the primary in use. Of course, when the normal number of primary turns are reduced in order to raise the secondary voltage, a suitable iron core choke coil or impedance must be used in series with the primary winding in order to control the current, so that the transformer will not over-heat and burn out the windings.

2 K. W. STEP-DOWN PIPE THAWING TRANSFORMER.

(996) Joel H. M., Carney Point, N. J., inquires:

Q. 1. Can you supply data on a 110 volt, 60 cycle, A. C. step-down transformer for pipe thawing, the secondary giving about 12 volts.

A. 1. We give herewith data on the construction of a 2 K. W. transformer suitable for operation on 110 volt, 60 cycle, A. C. The secondary is suited to develop a current of about 13 volts and 150 amperes.

The primary winding of this transformer consists of 13½ pounds or 244 turns of No. 8 B. & S. D. C. C. magnet wire, or 2 No. 11 D. C. C. wires can be wound side by side and connected in parallel. The laminated sheet iron core, on one leg of which the primary is wound, should measure 17½ inches long by 8¾ inches wide, and have a cross-section of 2¼ × 2¼ inches.

The secondary winding for this transformer should comprise 31 turns of No. 0 B. & S. gage D. C. C. magnet wire, and will develop a current of about 13 volts and 150 amperes. If this is too difficult to wind on, 2 No. 3 wires may be used or 4 No. 6 wires, connecting these wires in parallel.

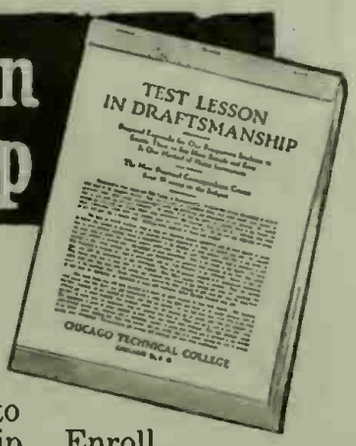
REWINDING DYNAMO.

(997) A. C. McLellan, La Porte, Ind.:

Q. 1. I want to know what size wire the armature or field or both will have to be wound with to get 40 volts and as much amperage as possible from a dynamo as follows:

Field is 6 pole, now wound with No. 20 D. C. wire, 1¼ pound to the pole. The armature has 28 slots, wound with 28 coils, parallel lap winding, and has 2 brushes at an angle of 60 degrees from each other. Each coil is wound with 20 turns of No. 20 D. C. wire. Commutator has 28 bars, diameter is 4¾ inches, length 3 inches, and at a speed of 2,000 R.P.M. it now generates 105 volts and 9 amperes. The dynamo is shunt wound, and when wired for 40 volts I want it shunt also. It seems to pull very hard now without any load on it at all.

A. 1. We would advise as follows concerning the rewinding of your 105 volt, 9 ampere dynamo:



For 40 volts the field should be rewound with the same amount of wire, or 1¼ pounds per pole of No. 15 B. & S. gage D. C. C. magnet wire. The armature should be rewound with the same number of coils and in the same fashion or style of winding as previously used, but each coil should be composed of 7 turns of No. 15 B. & S. gage D. C. C. magnet wire.

You mention that the dynamo armature seems to turn very hard without any load on it at the present time. This most likely is not due to any electrical reasons, but merely mechanical ones. We would suggest that the bearings be carefully inspected; also on some small dynamos fitted with a number of brushes, the brush friction is made too great, and they should be readjusted so as to have just sufficient spring tension against the commutator to eliminate any undue sparking. In some cases,

FREE Test Lesson In Draftsmanship

Send for this free lesson which explains the Chicago "Tech" method of teaching Draftsmanship by mail. Positions at big salaries are now waiting for competent men. Even draftsmen of limited training and experience are snapped up and paid good salaries. If you are dissatisfied with your opportunities, learn Draftsmanship. Chicago "Tech" will train you in the most practical way in the shortest time. Mail the coupon today and let us tell you about the Chicago "Tech" method. The free lesson will show you how well equipped you are to follow Draftsmanship. Enroll in the course only if you decide that you can take it up to advantage. No cost, no obligation on you to make this investigation. Send the coupon.

$25 to $100 a Week

Draftsmen always command good salaries. And now when American industries are to be called upon to meet vast foreign and increased domestic demands, the opportunities are greater than ever. This is the time for you to prepare for a better position—a higher salary.

Come to the College or

Learn At Home

Hold you present position while training. Our experts will instruct you by mail. Only your spare time is required. You are directly under practical draftsmen and engineers. You are taught exactly the work required in the drafting rooms of big concerns. No time put in on unnecessary studies. This means thorough instruction and early graduation.

Easy Payments

The fees for Chicago "Tech" Courses are very moderate—and you can pay on easy terms. And also, you obtain in a few months what it would take several years to acquire by ordinary methods. You can get an early start. You are soon ready to take a paying position and to quickly get back the cost of your course. Then keep on earning more.

FREE Instruments

Every student of the Chicago "Tech" mail course in Draftsmanship receives this set of instruments, or a cash credit in case he already has a set. These instruments are of the same make and sizes as are used by high salaried experts in drafting rooms of factories, shops, railroads, etc. You use them while learning—then take them right into your practical work.

Auto and Gas Engine Course

All about automobile mechanism—its construction, operation and REPAIR—taught by mail. You train directly under the Chicago "Tech" automobile experts. Splendid opportunities open now. Send coupon and get all the facts.

Learn All This in Spare Time

Principles of the Automobile. Every point made clear about the basic principles of propulsion—steam, gas and electric cars. Power transmission systems in pleasure and commercial cars, etc., etc.

Gasoline Engines. All about the different types. A complete course in gas engine construction, operation and repair.

Power Plants and Transmissions. Application of power by 4-6-8-12 cylinder engines. Types of clutches, gears, drives, axles, etc.

Carburetors and Fuel Supply Systems. All methods demonstrated. Fuel values. How to test. Gasoline and air mixtures. Regulation, care and management, etc., etc , etc.

Lubrication and Cooling All about oils and how to test them. Splash and circulating systems. Operation in different cars explained. Diagrams and tables. Cooling systems completely illustrated, etc.

Batteries. Electrical principles explained. Instructive diagrams of wiring and connections. Coils, condensers, vibrators, etc., etc.

Magneto Ignition. Principles and practical operation of various types and systems with diagrams. Generation of current. Field, armature, high and low tension, all explained. Complete in every point.

Starting and Lighting Systems. All modern methods. Starters—spark, mechanical, air, acetylene, electric, battery—shown in detail with diagrams and full explanations. Charging. Motor and generator adjustments, etc., etc.

Know How to Find and Fix Troubles

Most complete instruction in auto repair work. Equips you for high pay or to start a business. Big demand for trained repair men, and men who know how to inspect cars. This course makes you proficient. Prepares you to take a job as an expert. Not enough competent men now available.

WRITE Send the coupon and get catalog and all information about the Course, the small fee and the easy terms. All this sent on request. Mail coupon now.

Send the Coupon—Now

The sooner you are prepared the sooner you will be holding a job that pays a large salary and opens the way to advancement. Many executives, general managers and superintendents began as draftsmen.

Other institutions ask you to pay first—and then to find out later how well qualified you are for this profession. We send you the free lesson first and place you under no obligation at all. Discover your qualifications before you pay anything.

The coupon will bring the Teet Lesson, free. Also information about the profession of Draftsmanship and detailed facts about Chicago "Tech" methods, the fees, terms, etc. Mark with X the branch you are interested in—or if in doubt about which course to take, write a letter stating facts about yourself and asking our advice which will be freely given. Mail either the coupon or letter today.

CHICAGO TECHNICAL COLLEGE,

Thousands of Wonderful Opportunities in the Electrical Field

The Trained Man Is Needed Everywhere

By L. L. COOKE,
Chief Engineer, Chicago Engineering Works

BUSINESS conditions throughout America and even the world today are such that there are now truly wonderful opportunities for trained men in the electrical field. The electrical business has grown so fast and electricity is being continually applied to so many new uses that the demand for trained electrical men is growing faster than the supply.

Even on the farm electricity is now becoming common and thousands of farm lighting and power plants have already been installed. This shows how broadly electricity is applied today, and suggests something of the very great demand for hundreds of thousands more of trained electricians.

"Where will we get the men," is the question heard on every side. Electrical Manufacturers are spending thousands of dollars a week advertising merely for help. Look at the "Help Wanted" columns of any newspaper and see for yourself the demand for trained men. The salaries paid to young men with a thorough knowledge of electricity are unbelievable. The size of the pay envelopes going into the pockets of electrical workers every week reflects the scarcity of men to fill these responsible positions. So, not only is the electrical field greatly vacant now due to the absence of electrical men enlisted in the war services of our government, but it will be more greatly vacant when war's results are counted, and the need for men to fill the industrial places of our soldiers and sailor boys will swell the demand.

Moreover, the reconstruction and readjusting periods to follow in the war's wake are going to increase the employment of electrical workers beyond even the natural immense requirements. Electricity is yet to do its biggest services to the world after the war. Tho unlimited are its boundaries now, electricity and men who know its functionary phases and operations will have even wider scope and opportunity for years after peace is declared.

The most vital question for the young man of today to answer is not "Shall I enter the electrical profession?" but "What is the quickest, easiest and surest way to become a trained electrical man?" Time was when it took from three to four years to turn out an accomplished electrician who could be entrusted with any job that came along. Only a few years ago it used to cost thousands of dollars to make an accomplished electrician, which amount was made up in expensive tuition, board, etc., as well as money lost in non-production while the student was learning. Hundreds of thousands of dollars were lost in this manner because the student, seldom, if ever, is a producer while studying. This means a tremendous loss to the nation, as a minute's reflection will readily show.

Correspondence instruction has changed all this. By this method the student wastes no time on unnecessary branches. He gets exactly the training he will use in practical work and throughout his entire course he has the direct personal instruction of specialists in the branch he has selected.

Further, he can do his studying at home, in his spare time. He does not have to give up his regular job until he has qualified as a Certificated Electrician and is ready to enter his new profession. Think of the thousands of dollars this one great feature of correspondence instruction has saved this country in the past year alone.

I urge every young man with ambition and pluck to grasp the opportunity that present conditions offer the electrically trained man. Don't hesitate because of age or experience. Young men, boys and old men are needed and must fill the gaps to keep business going. Do your part. Prepare yourself for a real position by specializing in some branch of electricity. All you need is a few months' practical, snappy instruction from a competent engineer and you will be ready to go after some real money. But do it now. Our boys are returning filled with ambition, strong and healthy after two years' out-door living. How can you hope to compete throughout the reconstruction period without the special knowledge and advantages training will give you?

The Chicago Engineering Works are ready to help you. A specially designed course has been prepared that will fit you in the shortest possible time to take up the extremely interesting and profitable work as a Certificated Electrician. The course is the result of many years' teaching of young men in this vast field. It is intensely practical. It is highly condensed, simplified, up-to-date and complete. You can make a splendid success in this study, and the school will guarantee, under bond, to return every cent paid for tuition, if you are not entirely satisfied when you receive your Electrician's Certificate granted you as a graduate of the school. We teach contracting and electrical drafting along with the course and hundreds of our graduates are now successful contractors.

You can take the entire course in your spare time. No interference with your regular duties. We understand just what you must know and have devised a really wonderful way of instruction by mail. We have trained thousands of men and will train you to your complete satisfaction or the course will not cost you one cent.

Remember, that you will not be under the slightest expenses except the tuition price. A splendid Electrical Outfit is given free to every student and much of the training is done by actual work with this outfit. You have no car-fare or living expenses as you would have if you studied at a trade-school. You don't have to buy your outfit, or pay for the maintenance of expensive school equipment as you would elsewhere. The electrical outfit which we give every student includes Electrical Tools, Instruments, Materials, etc., and is given absolutely free.

The price of the course, you can pay in small installments if you want to—in other words, you can pay as you go along. These payments you can take out of your salary which you receive from your regular employment, it not being necessary to give this up until you are fitted and ready to take a good position as a real electrician.

One excellent feature of the assistance the Chicago Engineering Works is giving young men to help them succeed is the free employment service. The standing of the school is so high and the quality of students so well known that many firms rely entirely upon our graduates to fill vacancies in their staffs. We are continually receiving requests from employers to send them trained Electrical men. We assist our students to good positions and keep in touch with them for years, helping and advising them in every way possible.

I cannot urge all young men too strongly to get into the field of electricity. I know the vast opportunities for bright men and the opportunities have never been better than they are now and will be for the next ten years. The industry needs you and will give you a good chance to make a success of your life. Write us and let us tell you all about what we can do for you.

We have just prepared a new book on Electricity and its Opportunities and I want to send you this wonderful book—FREE. Write me personally telling me just what you are doing and what you would like to do. I'll gladly answer your letter myself and give you the benefits of my many years' experience in this field. But whatever you do, don't neglect the golden opportunity now offered live men. Address L. L. Cooke, 443 Cass St., Chicago, Ill.—Adv.

You benefit by mentioning the "Electrical Experimenter" when writing to advertisers.

www.americanradiohistory.com

BE A CERTIFICATED ELECTRICIAN

A Real Position Like This—For You

The country needs thousands of trained, Certificated Electricians to fill good positions—and at big pay. It's all a matter of knowing how, and I will teach you by up-to-date, modern instruction. You can learn at home, without interfering with your regular work, by my highly successful method of *Home Instruction* in *Practical Electricity*.

Prepare NOW and be ready in a few months to earn your $46 to $100 A WEEK

Send for this Book

My book, "HOW TO BECOME AN EXPERT ELECTRICIAN," has started thousands of young men on the way to splendid success. A new edition of this has just been printed. I want every young man interested in Electricity to have a copy, and will send you one, ABSOLUTELY FREE and PREPAID. Write me today.

How I Train My Students

As Chief Engineer of the Chicago Engineering Works I know exactly the kind of training a man needs to enable him to get and hold good positions, and to earn big pay. I have trained hundreds of men who are holding splendid electrical jobs.

I give each of my students personal attention and a complete and thorough training. I give him a SPLENDID ELECTRICAL OUTFIT FREE, and much of the training is done by actual work. When my students graduate and receive their Certificate, they are ready for a real position. But *still more*, at any time you wish you can come to our splendidly equipped Electrical Shops for special training. No other school can give you this.

A Real Opportunity for YOU

Wishing is never going to make your dreams come true. You've got to *study*—to *learn*. A man is worth possibly $2 or $3 a day from his neck down—and no more; but there is *no limit* to what he can be worth from his neck up.

A *trained mind* is what gets the big pay. It is this training that you need, and I can train you in a few months. Are you ambitious to make a real success—then send me the coupon—today.

Electrical Outfit FREE

To every student who answers this ad I am giving a Splendid Electrical Outfit of standard size Electrical Tools, Instruments, Materials, etc., *absolutely free*. Furthermore, to every Electrical Student I give a truly *valuable* surprise that I cannot explain here.

Free Employment Service

I am continually receiving requests from employers to send them trained Electrical men. I assist my students to secure good positions. I keep in touch with them for years, helping and advising them in every possible way.

Write Now—Don't Delay

Delay never got you anything. Action is what counts. Get started—and get started now. Write me send me the coupon right NOW.

FUNK & WAGNALLS COMPANY, Dept. 267, NEW YORK, N. Y.

Rider Agents Wanted

Everywhere to ride and exhibit the new Ranger "Motorbike" completely equipped with electric light and horn, carrier, stand, tool tank, coaster-brake, mud guards and anti-skid tires. Choice of 44 other styles, colors and sizes in the famous "Ranger" line of bicycles.

DELIVERED FREE on approval and 30 DAYS TRIAL. Send for big free catalog and particulars of our *Factory-direct-to-Rider* marvelous offers and terms.

TIRES Lamps, Horns, Wheels, Sundries, and parts for all bicycles—at half usual prices.

SEND NO MONEY but tell us exactly what you need. Do not buy until you get our prices, terms and the big FREE catalog.

MEAD CYCLE COMPANY Dept. D107 CHICAGO

THE ORACLE

(*Continued from page* 46)

also, the armature may rub against the field poles, and this can be easily ascertained by removing the armature and noting if there are any shiny spots on the field poles or armature core.

ELECTRIC ARC TEMPERATURE

(998) James G. Peck, Elmira, N. Y., says:

Q. 1. What is the temperature of the electric arc produced between two ½ inch carbons?

A. 1. In regard to data for building an arc light from two ½ inch diameter carbons to give you a temperature of 3,500 degrees Centigrade, any arc, large or small, gives about the same temperature roughly speaking; the large arcs using larger carbons simply giving a greater quantity of heat, but not a higher temperature. The electric arc will give you the greatest temperature of any ordinary source of heat known. The average arc, using ½ inch carbons, either cored or solid, consumes about 5 amperes, on 110 volts, and the candle power is about 1200.

Appended are some interesting high temperature sources of heat:

Bunsen burner	1,870 deg. C.
Oxy-coal gas flame	2,000
Oxy-hydrogen flame	2,800
Oxy-acetylene flame	3,500
Electric arc (furnace)	3,500

RADIO LOOSE COUPLER DESIGN

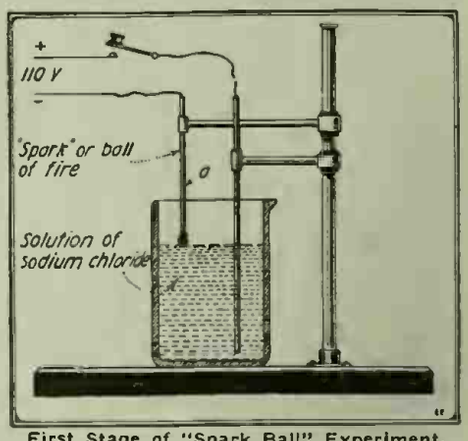
(999) Alvin Harrison, Albert Lea, Minn., asks:

Q. 1. Several questions on designing loose couplers for wireless receiving circuits.

A. 1. In standard practice it is usual to provide both primary and secondary coils with loading inductances, these inductances being either a separate part of the circuit, or else combined with the coupler windings themselves, preferably the latter.

The primary as well as the secondary circuits are, in the most efficient design of coupler, made so as to form a continuous coil capable of being tuned to the highest wave length which it is desired to receive. Any other form of loading inductance which is separate from the windings of the coupler only form a source of loss, for it requires a certain amount of energy (I^2R) to excite this separate loading inductance, and, as it does not form a part of the main coupler winding, and is not useful in producing a part of the common electromagnetic field which transfers the energy from the primary to the secondary circuit, as you will see, in any event then it must be a source of *unrecoverable loss.*

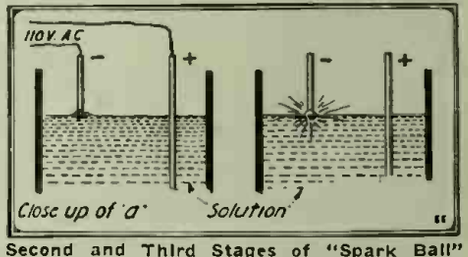
We would refer you to a very good article on "Building a 20,000-meter Undamped Receiving Set," by William Burnett, Jr., page 258, August, 1917, issue; also



"The Design of Large Radio Receiving Transformers," by Chas. S. Ballantine, Radio Engineer, page 732, February, 1917, issue.

"The Calculation and Measurement of Inductance," by H. Winfield Secor and Samuel Cohen, parts 1, 2 and 3, which appeared in the March, April and September, 1917, issues.

PECULIAR SPARK BALLS.



(1000) R. J. O., San Antonio, Texas, writes:

Q. 1. I am a reader of the ELECTRICAL EXPERIMENTER and desire some information regarding an experiment performed in my "Lab" some time ago which I am at a loss to know "the why and wherefore" of. Thus: I made a solution of Sodium Chlorid and water, in a small beaker. (See sketch.) Using a current of 110 volts and a small telegraph key to open and close the circuit, I connected it as shown in the "hook up." I proceeded as in sending a telegraph message and found that a rapid movement of the key produced a stream of what appeared to be sparks between the neg. (—) pole about 1/32 of an inch above the solution. The so-called "sparks" will continue to appear as long as the copper wire lasts. (It melts rapidly). My question is "What are those sparks?" If not sparks, what is it?

First Stage of "Spark Ball" Experiment.

A. 1. The experiment which you describe is nothing new and is well known to those who have experimented with electrolytic interrupters a good deal. This experiment can be performed not alone with sodium chlorid, but with almost every acid. Providing the current is strong enough, a ball of fire will appear at the end of one wire which touches the surface for the following reason: As soon as the point touches the liquid which has a more or less high resistance, the solution at this point immediately starts to boil. At the same time hydrogen gas is evolved, and the electric current setting fire to it explodes this minute quantity of gas, thereby giving rise to a small explosion. This phenomenon occurs in very rapid succession, and the explosions take place several thousand times per second. Mr. H. Gernsback some years ago obtained quite large "fire balls" of this sort by using a fine carbon pencil as one electrode.

Second and Third Stages of "Spark Ball" Experiment. The Theory of Its Action Is Very Interesting.

200 WATT TRANSFORMER DATA.

(1001) James Dicks, Delhi, La., inquires:

Q. 1. Please give me data on 200 watt step-up wireless transformer for operation on 110 volts, 60 cycles.

A. 1. The laminated sheet iron core for this transformer should measure, for a 200 watt transformer, 10½ inches long by 6½ inches wide and 1 x 1 inch in cross-section. The primary winding, placed on one of the long legs, should comprise 660 turns No. 15 B. & S. gage D. C. C. magnet wire. Before winding on the primary coil, the iron core leg should be insulated with four layers of oiled linen or Empire cloth.

The secondary winding should comprise 17 pies or sections, each ¼ inch thick, with paraffin paper discs between them when assembled. The size of the secondary wire should be No. 34 B. & S. gage D. C. C. and 3.7 pounds of secondary wire are required. There should be about 35,000 turns in the secondary, and the secondary voltage with

How Would You Train 50,000 Employees?

Western Union's Big Problem Think of an army of 50,000 men and women, differing greatly in ability, adaptability and previous training — remember that all of them were self-supporting wage-earners, who could not afford to let anything interfere with their regular occupations — consider that it was their employer's desire to make intensive training practical for all, without lessening their present efficiency—and you have some idea of the complex employe-training problem that confronted the WESTERN UNION when it undertook to make it possible for any of its 50,000 employes to acquire a higher degree of efficiency in their work.

How it was Solved As WESTERN UNION found that there were no courses covering completely and thoroughly the highly specialized telegraph business, it had special texts written by its own experts, who thus became the personal instructors of its employes. After careful inquiry, the Company decided that the correspondence instruction method would give all employes an equal opportunity, while its flexibility would meet any individual needs and circumstances. And finally WESTERN UNION arranged to loan the price of the Course to deserving employes who might be unable to meet even the moderate fee asked for training.

The actual conduct of courses and instruction was entrusted to the American School of Correspondence, Chicago, whose Educational Charter and 22 years' successful experience eminently fitted it to carry out WESTERN UNION'S plans to make special training possible to any of its 50,000 employes.

Don't Dodge Promotion

Whatever occupation you would prefer to follow you can't dodge the fact that you're dodging promotion — dodging the job ahead, with its guarantee of better pay — so long as you refuse to train yourself thoroughly for the work you want to do. The man or woman with training is bound to succeed—for trained workers are the scarcest commodity in industry. A glance at the "Help Wanted" columns of your daily paper — *a question put to your boss* — will quickly prove this. The American School can properly develop your natural ability —make you a thoroughly skilled worker. A small part of your spare time—some of the hours you now waste—invested in systematic study will soon fit you for the position, and pay, you want.

Make This Test

We will train you on a make-good basis—allow you to test out the practical value of any Course by covering the first ten textbooks without risking one cent. This means that if you're not satisfied with your progress — if you find you're not getting money-earning training from the course — we'll refund every cent you've paid us. Full satisfaction or your money back is the only basis on which we accept students. If the fairness of this offer appeals to you—as it has to thousands—check and mail the Coupon for Free Bulletin. You assume no obligation.

THE ORACLE

(*Continued from page* 50)

all primary turns in use is 5,890. The secondary voltage is increased in proportion as the number of primary turns in circuit at any time are decreased. The secondary leg of the core should be well insulated with 10 layers of oiled linen before placing the pies in place.

NEUTRAL POINT OF D. C. DYNAMO AND A. C. MOTOR SPEED CHANGES.

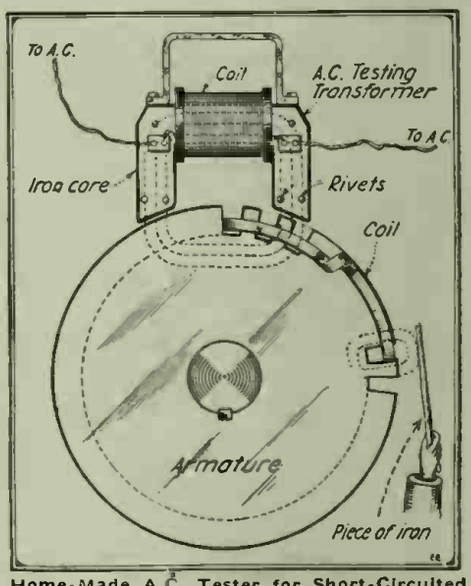
(1002) R. G. LeTourneau, Stockton, Cal., asks the Oracle:

Q. 1. Several questions concerning the shifting of the neutral point on a D. C. generator and speed changes of induction motors.

A. 1. The neutral point on the commutator of the D. C. generator changes at least slightly with changes in speed of the armature as you mention, unless the machine has one of the following precautions taken in its design: The machine might have a very powerful field, which would cause a very even and rigid distribution of the flux at the pole tips; the machine might be provided with *interpoles*, such as provided on any one of the leading machines on the market at the present time, which tends to preserve an even distribution of the field flux, and thus to preserve a practically fixt neutral point, thus obviating the necessity for shifting the brushes, even on overloads of 50 per cent. Or again the machine might be provided with variable air gaps between the field pole tips and the armature, such as in the Stow design, where all of the field poles are geared together by means of worms and gear rods to a common handwheel on the top of the machine, which enables the field poles to be advanced toward or receded from the armature and the air-gap flux distribution varied.

You are correct in assuming that several different speeds can be obtained from an A. C. motor by changing the groupings of the field poles, i.e., by changing the number of poles, such as by causing the field to produce 4 poles, 6 poles, 8 poles, and so on. This system is adopted in some of the leading A. C. motors now on the market. You will find data on this subject by referring to books on A. C. machinery.

A. C. TEST FOR "SHORTED" ARMATURE COILS.



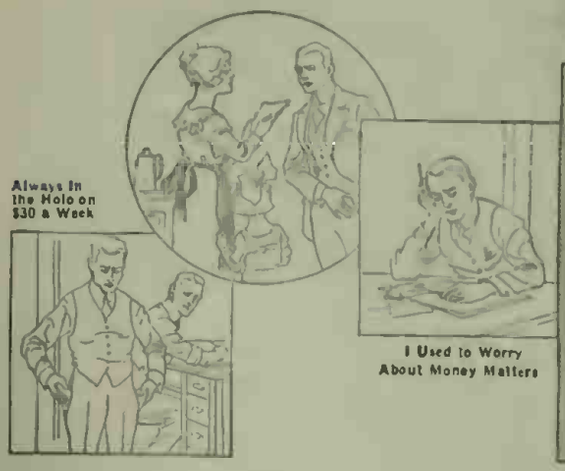
(1003) Earl E. Teater, Wheeling, West Va., writes the Oracle:

Q. 1. For data on a simple A. C. testing scheme for short-circuited armature coils.

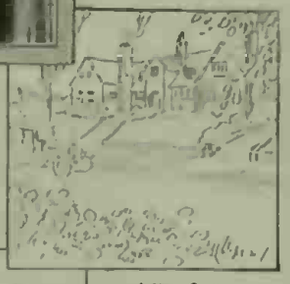
A. 1. Herewith we describe an A. C. testing device for determining whether armature coils are short-circuited or not and which is used in repair shop work. The small transformer has a single winding on it, which is excited with alternating current suitably controlled by connecting it in series with a lamp bank or choke coil, etc. Using this transformer primary, as it may be called, and holding it in contact with the armature, in successive positions, as the armature is turned from coil to coil, there is set up thru the armature core a magnetic flux, which induces a current in the armature windings. If one of the coils happens to be short-circuited, as becomes apparent, this current will heat up the coil. Also by turning the armature a complete revolution and holding a small piece of iron against it, the coils being tested for short-circuits will be easily located, as the piece of iron held near the coil will vibrate, due to the resultant magnetic field set up by this coil and the current passing thru it. The transformer device should not be put in position nor removed while current is flowing thru the magnetizing coil of course.

To make this testing transformer, a laminated sheet iron core of the shape indicated in the diagram is built up, and it may be riveted at several points. It should have a width equal to the approximate length of the armature, and also a pole-face curvature as nearly like that of the armature core as possible. The winding on this transformer may, for a small size device to be used in testing out small magneto or auto lighting dynamo armatures, be composed of about 75 turns of No. 14 B. & S. insulated magnet wire.

A very satisfactory and simple test for short-circuited as well as open-circuited armature coils can be carried out by connecting a buzzer across the brushes, and thus testing from bar to bar with a 75 ohm telephone receiver. If a coil is short-circuited or partially short-circuited, then no sound or a weak sound will be heard in the telephone receiver. It has been found that this test will give better and more accurate



Home-Made A.C. Tester for Short-Circuited Armature Coils. The Materials Required to Build It Are Available About Any Shop. Its Action Is Simple, Yet Positive.



results in a minimum of time, than is the case where the Wheatstone bridge is used. Open-circuited coils will manifest their presence when the proper bars are bridged by a very loud noise in the receiver. It is common practice in many shops to use this test in connection with the 110 volt, 60 cycle A. C. lighting current, the necessary current being past thru the armature in series with a 110 volt lamp.

If you have a good voltmeter on hand or posibly an ammeter without the shunt on it, you can also make tests quickly for open or short-circuited coils or grounds by the bar-to-bar test, passing direct current thru the brush points on the commutator. For this work the armature is usually mounted in a testing cradle, comprising a wooden frame and one upright which carries a pair of adjustable copper or other brushes which will transmit the testing current to diametrically opposite points on the commutator, for the two-pole armature, or four points ninety degrees apart for a four-pole armature. In any case where the telephone receiver and A. C. or buzzer method are used, or the voltmeter method, the criterion of the tests for a perfect armature is to obtain a similar or very closely similar degree of sound in the receiver for each coil, or an equivalent similarity in the voltmeter readings for every coil on the armature. If any appreciable difference is noted in the meter readings or in the telephone, then the connections of the commutator, and also the leads of the coils should be carefully examined. Sometimes a high reading will result from a poorly soldered lead connection to the commutator bar, which on a superficial examination may appear to be a first-class soldering job.

www.americanradiohistory.com

"At Dawn the Answer Flashed on Me!"

How a young man jumped from $30 a week to $50,000 a year. His remarkable success he attributes to the way he uses his will. "What I've done, I believe anyone can do," he says.

THERE are only a few $50,000 jobs—yet of all the men in the country it is difficult to find enough to fill the few big jobs available. There are plenty of men for the $25-a-week positions—but the thousand-dollar-a-week openings "go begging." How this young man trained himself for earnings of $50,000 a year is one of the most interesting chapters in the annals of even present-day fortune making. This is the story told me, almost word for word, by the young man *who did it*.

"Three short years ago I was $5,000 'in the hole'—and earning $30 a week. I had a wife and two children to support, and I used to worry myself sick about the future.

"Today—it seems like a dream—all my troubles are over. I am worth $200,000—enough to keep me and my family in comfort for the rest of our lives. I own two automobiles. My children go to private schools. I have just purchased, for cash, a $25,000 home. I go hunting, fishing, motoring, traveling, whenever I care to.

"LET me say in all sincerity that what I have done I believe any one can do. I am only an average man—not 'brilliant'—have never gone to college—my education is limited. I know at least a hundred men who know more than I, who are better educated and better informed—and their earnings probably average less than $50 weekly while my income is over $1,000 weekly. I mention this to show that earning capacity is not governed by the extent of a man's education—to encourage those who have not had the advantage of a comprehensive education.

"What, then, is the secret of my success? Let me tell you how it came about.

"One day, about three years ago, something happened that woke me up to what was wrong with me. It was necessary for me to make a decision on a matter which was of little consequence. I knew in my heart what was the right thing to do, but something held me back. I said one thing, then another; I decided one way, then another. I couldn't for the life of me make the decision I knew was right.

"I lay awake most of that night thinking about the matter—not because it was of any great importance in itself, but because I was beginning to discover *what was wrong with me*. Along towards dawn the answer flashed on me and I resolved to make an experiment. I decided to cultivate my will power, believing that if I did this I would not hesitate about making decisions—that when I had an idea I would have sufficient confidence in myself to 'put it over'—that I would not be afraid of myself or of things or of others. I felt that if I could smash my ideas across I would soon make my presence felt. I knew that heretofore I had always begged for success—had always stood, hat in hand, depending on others to give me the things I desired. In short, I was controlled by the will of others. Henceforth, I determined to have a strong will of my own—*to demand and command what I wanted.*

"WITH this new purpose in mind, I applied myself to finding out something more about will power, and in my investigation I encountered the works of Professor Frank Channing Haddock. To my amazement and delight, I discovered that this eminent scientist, whose name ranks with James, Bergson and Royce, had completed the most thorough and constructive study of will power ever made. I was astonished to read his statement, 'The will is just as susceptible of development as the muscles of the body!' My question was answered! Eagerly I read further—how Dr. Haddock had devoted twenty years to this study—how he had so completely mastered it that he was actually able to set down the very exercises by which anyone could develop the will, making it a bigger, stronger force each day, simply through an easy, progressive course of training.

"It is almost needless to say that I at once began to practice the exercises formulated by Dr. Haddock, and I need not recount the extraordinary results that I obtained almost from the first day. You already know the success that my developed power of will has made for me.

"People sometimes worry because they cannot *remember* or because they cannot *concentrate*. The truth is, will power will enable them to do *both*. The man who can use his will can not only concentrate and remember, but can *make use* of these two faculties. And I want to leave this one word with you—no knowledge, no plan, no idea is worth a penny unless it is used—and it cannot be used unless some one's power of will does it!"

PROF. Haddock's rules and exercises in will training have been placed in book form, and I have been authorized by the publishers to say that any reader who cares to examine his startling book on will power may do so without sending any money in advance. In other words, if after a week's reading you do not feel that "Power of Will" is worth $3, the sum asked, return it and you will owe nothing.

When you receive your copy for examination I suggest that you first read the articles on: The law of great thinking; How to develop analytical power; How to guard against errors in thought; How to drive from the mind unwholesome thoughts; How to develop fearlessness; How to use the mind in sickness; How to acquire a dominating personality.

It is interesting to note that among the 225,000 owners who have read, used and praised "Power of Will" are such prominent men as Judge Ben B. Lindsey; Supreme Court Justice Parker; Wu Ting Fang, ex-U. S. Chinese Ambassador; Gov. McKelvie of Nebraska; Assistant Postmaster-General Britt; General Manager Christeson, of Wells Fargo Express Co.; E. St. Elmo Lewis; Senator Arthur Capper, of Kansas, and thousands of others.

As a first step in will training, I would suggest immediate action in this matter before you. It is not even necessary to write a letter. Use the blank form below, if you prefer, addressing it to the Pelton Publishing Company, 30-J Wilcox Block, Meriden, Conn., and the book will come by return mail. This one act may mean the turning point of your life as it has meant to me and to so many others.

Pelton Publishing Company,
30-J Wilcox Block, Meriden, Conn.

I will examine a copy of "Power of Will" at your risk. I agree to remit $3 or remail the book in 5 days.

Men Wanted for Airplane INDUSTRY

Wonderful opportunities—great scope for advancement—and big pay—await you in the airplane industry. This does not mean actual flying, but in any and all of the various branches of the industry. It is the coming profession—the future means of transportation. U. S. Mail is already being carried by airplanes. Factories are springing up everywhere and trained men are in big demand.

Openings in Many Branches You can get into this profession while it is still in its infancy as a mechanic, engineer, repairman, instructor, inspector, builder, contractor, salesman or professional aviator. The minute you understand the science and mechanics of aviation you can step into a high-salaried position.

We Guarantee Our Training

We absolutely and unreservedly guarantee that our Home Training Course will enable you to qualify for a good position as soon as you graduate. The Course itself has been written by noted aeronautical engineers, and covers the entire fundamentals of practical aeronautics. Every lesson is written and illustrated so clearly that you cannot fail to understand it. **But see for yourself.** Take ten lessons. Then if you are not satisfied you are not out one cent. We guarantee satisfaction.

Prepare Now for a Big Future

Only by specialized instruction can you expect to succeed in aviation or in any line of business. Training alone will fit you for a big job—and NOW is the time to begin. Check and mail the coupon for Big Free Bulletin and Money-Back Guarantee.

AMERICAN SCHOOL OF CORRESPONDENCE
Dept. F 7445 CHICAGO, U. S. A.

CAPT. GEO. F. CAMPBELL, Chief Instructor, National Aero Institute, 538 S. Dearborn St., Dept. 7445, Chicago

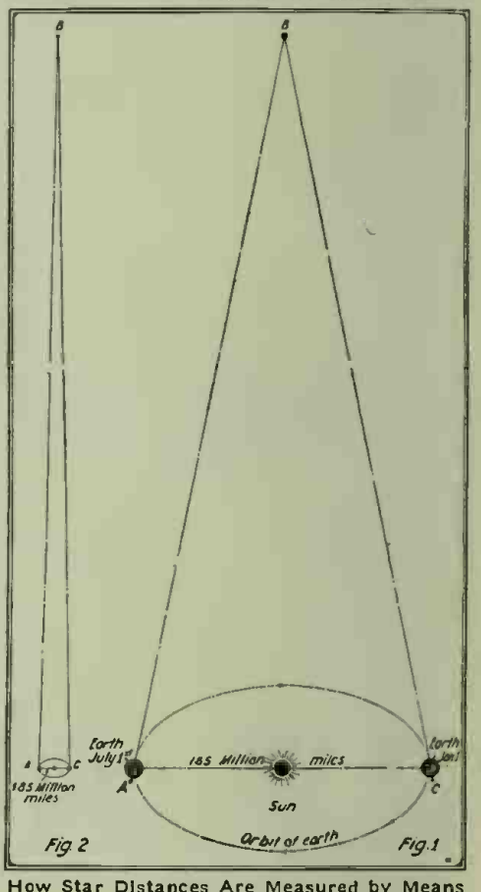
"SEXUAL DISASTERS"

is something different. Actual cases from pen of a physician. Warns you against hundreds of sex evils in very plain language. More interesting than fiction. Sent immediately, postpaid, for $2.00. MONONGAHELA NOVELTY CO., Box A-565, MONONGAHELA, PA.

Popular Astronomy

Astronomical Distances

(*Continued from page* 25)



ured with considerable accuracy and is known to be four and a third light years. Tho there may be a few faint stars or non-luminous stars nearer to us than Alpha Centauri, and there is, in fact, one inconspicuous star known to be slightly nearer, the distinction of being the nearest of the brighter stars has long been held by Alpha Centauri. As our own sun continues his journey thru the universe the two stars (our sun is a star just like Alpha Centauri) will finally draw away from each other after many ages have past and some other sun of space will be our nearest star. The distances that separate the stars from each other probably average as great as the distance from the sun to Alpha Centauri. Within a sphere whose center is at the earth and whose radius is five parsecs, or about sixteen light years, there are only about twenty known stars. There is therefore small chance of collision among bodies that are so small in proportion to the tremendous intervals of space that separate them from each other. There is ample room for the individual stars to pursue their journeys thru space without interfering with each other's motion so long as they are as widely scattered as they appear to be in this portion of the universe. That our own sun has continued its journey thru the universe for some hundreds of millions of years without any catastrophe such as would result from closely approaching or colliding with another sun of space shows on how grand a scale our sidereal system is fashioned.

Stars that are ten, fifty or even one hundred light years from the earth are our near neighbors in space. They are the stars that show a slight displacement in the heavens or measurable parallax viewed from opposite sides of the earth's orbit. There are probably a thousand stars among the hundreds of millions of stars within reach of the greatest telescopes whose distances have been determined in light years by direct measurement of their displacement in the heavens resulting from the change of position of the earth in its orbit. The most distant of the stars are apparently immovable in the heavens showing neither the effect of the sun's motion or their own motion thru space. Methods for ascertaining the distances of many far remote stars and star-clusters have been devised, however, and some comparatively recent investigations have yielded determinations of the distances of these objects indicating that the diameter of the system of stars to which our sun belongs approximates to at least three hundred thousand light years. It is difficult to grasp the full significance of this fact. It means that hundreds of millions of the suns of space throng the visible universe at distances from us and from each other running into hundreds, thousands and even hundreds of thousands of light years. The light waves from some tiny object that we can just barely glimpse in one of our great reflectors may have started on their journey thru space over one hundred thousand years ago when men of the Old Stone Age inhabited our planet earth!

Astronomers have found as a result of their investigations that the sidereal system to which our solar system belongs is in the form of a flattened spheroid with its longest axis in the plane of the Milky Way. We have shown in a preceding article on the Milky Way how all the various units of our system, stars, nebulae and star clusters are distributed with reference to this plane, including our own sun. The extent of this star system composed of hundreds of millions of individual suns in addition to nebulae and clusters is, as we have said, at least three hundred thousand light years along its longest axis, while globular star clusters distributed above and below its central plane have been found to be at distances from it ranging from ten thousand to two hundred thousand light years. This entire organized system is our sidereal universe. Space beyond is unexplored. The globular star clusters are the most distant celestial objects so far discovered. The spiral nebulae may be entirely within the limits of this system or future determinations of the distances of the fainter spirals may extend the limits set by the globular clusters to include spirals found to be still more distant.

We can conceive the possibility that our sidereal universe, vast as it is known to be, may be but a unit in some still greater organization and that other similar systems lie beyond the reach of existing telescopes at unimaginable distances of a higher order.

The mind of man is overwhelmed by the thought of sidereal systems as vast as our own lying far beyond our ken. Whether or not such external systems do exist and are with our own sidereal system units in some still vaster creation we cannot know.

How Star Distances Are Measured by Means of Parallax.

We have attempted to grasp feebly the vast expanses of time and space that are to be found within our own sidereal system, but the finite mind of man cannot grasp the wonders of a creation in which our entire sidereal system may hold a position as subordinate as does our own planet in the sidereal universe to which our sun belongs.

The distances of stars are almost inconceivable to the human mind. They are computed by what is known as the parallax. In order to make this plain to the non-technical reader, Fig. 1 shows the method used. When the astronomer wishes to measure the distance of a distant star, he takes an exact observation of the star on January 1st when the earth is in position C. Then on July 1st he again observes the same star with very accurate instruments. Then he will have an angle A, B, C. The

BE THE MAN WHO KNOWS! -and Earn Big Pay

By our method of teaching, in your *Spare time at Home*

You Can Soon Be A Trained Man

Electrical, Steam, or *Marine Engineer,* or a Graduate in any of our numerous other *Practical Business Courses*

Your Diploma

Business Today Demands Trained Men—

you know that. Your success in life depends upon how well you prepare for it. It's a question of knowing your subject! Big business is looking, hunting, advertising—for big, trained men to accept good positions at big pay; such men are scarce; but there are always too many of the other kind. Which class are you going to be in

You want to study with a Real School. The high standing of the Jos. G. Branch School of Engineering may be indicated by the fact that

We Trained Over 1000 Men for Government Marine Service

No matter what line of training you need, you will probably find exactly what you want in the list of our courses below. Each course is practical and complete, yet everything is written, illustrated and explained so clearly that anyone who can read can understand it. Everything is made clear. You do not become involved in difficult technical matter which is of no value and discourages the student, but you go right straight through from the start to the finish—and then you've got it! You can't fail if you will simply do your part, and follow our instruction.

THE COURSE YOU WANT IS HERE

Complete, Practical Correspondence Courses in

Electrical Engineering	Marine Engineering	Practical Mathematics
Stationary Engineering	Drafting	Ingenieria Electrica (Spanish Course)
Power Plant Engineering	Drawing & Designing	Mechanical Refrigeration
Power Plant Accounting	Practical Chemistry	

VALUABLE BOOKS FREE

We have published a Library of Valuable Business Books covering each of the above courses, and we are furnishing a set free to each enrolled student who answers this ad. These are all standard books, each by an authority on the subject. The books above may be worth many times the cost of the course. Here is the Library that goes with the Electrical course:

Practical Electricity — The Electric Motor
Alternation Currents Simplified
Electric Wiring — Practical Mathematics

Send in the Coupon now for full particulars about the course you are interested in.

"Saved $100.00 On My Diamond"

The $85 diamond you send compares favorably to a ring recently bought at $185 (a saving of $100).—Name on request.

This firm nearly 3/4 century old, rated over $1,000,000. Ordered by mail, lends money on high grade jewelry. Amazing bargains in unpaid loan diamonds. Free examination.

Why Pay Full Prices

Prove for yourself that it's unnecessary. Send your name for wonderful Illste free. Every jewel accurately described in detail. Radically different from catalogs. See these prices before you buy.

Send for Latest List

Diamond Loans Must sell unpaid loans. Hundreds of diamonds for under market prices. Free examination. Amazing bargains proved by customers' letters. Write today.

BOYS! BOYS! JOIN The JUNIOR YANKS

Be the first to organize a company in your town. A real boys' organization—no grown-up leaders. Secure an officer's commission for yourself. Get four to six boys to join you.

The only boys' organization teaching military signals, wig-wagging, wireless telegraphy, machine gun and rifle drill, how to dig trenches, make tree entanglements, dug-outs, listening posts, how to advance and retreat, do scout and guard duty; all the things a real soldier knows.

Write today and we will tell you how to become a "Junior Yank" and officer, receive the official Junior Yank Trench cap and collar ornaments, and a complete military outfit without one cent of cost.

Send ten cents (stamps or coin) for the official magazine in colors, "The Junior Yank" and a copy of the manual of drill and rifle practice. Have all your boy friends write at the same time. Address

Junior Yanks, 202 W. Ohio St., Chicago, Ill.

USE HB BALL BEARING ELECTRIC MOTORS

HB Electrical Motors Save Power—Get Ball Bearing equipped HB Motors, as they save you a substantial sum each month on your power bills. Absolutely they are trouble-proof, economical, amply designed, just right for your requirements—one-half to 15 h.p., they substantially lower your power costs. Easy to install and operate. Require practically no attention.

$20.00 gives you an HB Ball Bearing motor. The balance on easy terms. Suits your requirements. Let our engineering department advise you. Send in your problems. State kind of machinery you wish to run and type of current available. Can also furnish Battery Charging Outfits, Lighting Generators, etc. Pin this ad to your letterhead and mail for further information today.

HOBART BROTHERS COMPANY
Box 5E Troy, Ohio
Successful Manufacturers Since 1893

Earn $35 to $100 WEEKLY

ALL OR SPARE TIME

You can make $35.00 to $100.00 a week. I want hustlers, money-makers, to work with me, to advertise, sell and appoint agents. Biggest thing in years. City conveniences without plumbing. Used in any room. Sells on sight. Demonstrating tub furnished. Folds small, self-emptying, non-leakable. Guaranteed 10 years.

AGENTS MAKE SALES EASILY

Two sales daily means $60.00 a week. Leggett, Ohio, "Worked two hours, took two orders, profit $10.00." Hayhurst, Nebr., "Took 11 orders in 4½ days—profit $55.00, ordered 12 more tubs." Manning, Iowa, "Sold 10 tubs in one day—profit $50.00." DeHut, Nebr., "Sold 12 tubs in three days—profit $60.00." And hundreds of others making big money. 70 per cent of homes have no bath tubs. Experience and capital unnecessary. Credit given to the right man. Get full particulars and "special plan" all free.

ASTRONOMICAL DISTANCES.

(*Continued from page 54*)

distance from A to C being roughly 185,000,000 miles, and the angle being known, it is easy to figure the distance from B to A by means of trigonometry. But if the star B is at an immense distance such as is shown in Fig. 2, the angle A, B, C becomes very small. As some of the stars are billions upon billions of miles removed from the earth, it will be readily seen that there will come a point when the angle A, B, C ceases to exist. In other words, the distance A to C, altho 200,000,000 miles, will practically vanish—as it is so little—and the angle becomes so sharp that A, B, C is practically nothing but a straight line. As a matter of fact most of the stars which we see are so far removed from the earth that they have no appreciable parallax, and it is therefore impossible to know how many billion miles such a star is removed from the earth. As a matter of fact only a comparatively few stars exist that show an appreciable parallax, even with the extraordinary degree of perfection attained in measuring instruments. Such is the inconceivable magnitude of interstellar distances.

Distances from the sun to the planets and to the nearest star in terms of the astronomical unit (distance from earth to sun) and in millions of miles.

Table I.

	In Astronomical Units	In Million Miles
Mercury	0.39	36.0
Venus	0.72	67.2
Earth	1.00	92.9
Mars	1.52	141.5
Jupiter	5.20	483.3
Saturn	9.54	886.0
Uranus	19.19	1,781.9
Neptune	30.07	2,791.6
Alpha Centauri (nearest star)	273,000.00	26,000,000.0
Value of light year	63,000.00	6,000,000.0
Parsec	206,265.00	20,000,000.0

Table II.

Time required to travel from the earth to sun, moon, planets and nearest star by airplane, (at the rate of 200 miles per hour), and with velocity of light, (at rate of 186,324 miles per second).

To	By airplane	With velocity of light
Moon	7 weeks	1¼ seconds
Sun	52.99 years	7 min. 59 sec.
Venus	14.37 years	2 min. 18 sec.
Mercury	32.46 years	5 min. 6 sec.
Mars	27.72 years	4 min. 21 sec.
Jupiter	222.68 years	35 min. 15 sec.
Saturn	452.37 years	1 hour 11 min.
Uranus	963.38 years	2 hours 32 min.
Neptune	1,539.30 years	4 hours 2 min.
Alpha Centauri (nearest star)	14½ million years	4.35 years

Note: The above results were obtained by using the *mean* distances of the planets from the sun and the nearest approach of the planets to each other.

RELIEVING THE CAR CRUSH.

(*Continued from page 15*)

lide! The westerner wants to get off and the easterner wants to get on, naturally.

Now an old axiom says that one mass can't take the place of another mass without displacing that first mass. But tho we have learned in our physics class that water is not compressible, Subway passengers are compressible to the NTH degree.

Then after a homeric battle in which both sides display a titanic amount of muscular effort the "westerner" is finally ejected forcibly from the car and a half dozen "easterners," with the "gentle" help of the subway gladiator, are packed into the train, which proceeds on its way until the next station, where the same little game of forcible subtraction and addition is enacted all over again.

The cure? There are three doors on each New York subway car: Two on each end and one (about the same size as the front and end door combined) in the center. If the outgoing passengers could use, say, the end doors only and the incoming travelers the middle doors only, and if this rule would be strictly enforced, don't you think that this would help to make the Subway a better place to travel in?

And, besides, Kipling *would* be right. "East and West, they never shall meet!" Anyway, not so rudely!

ELECTRIC VIOLIN-VIRTUOSO A MARVEL.

(*Continued from page 21*)

is obtained by means of a third magnet which vibrates the tail piece thru the medium of the shaker bar.

To produce the wonderful orchestral effects achieved by the Violano-Virtuoso, as the instrument is called, it is necessary to use not one but *four* bows—one for each string.

These bows consist of numerous conical discs of specially prepared flexible celluloid, the edge of each disc acting as the hair of a bow. And it is possible for these revolving bows *to play simultaneously on all of the four strings.* These 4 bows are operated by bow magnets and are mounted on a bow shaft extending over the bridge. This, in connection with the fact that the instrument has sixty fingers against the *four* available to the human violinist, is the reason why this instrument can, with facility, render the most difficult concertos, etc.—the master-pieces of the world's musical literature—some of which it is manifestly impossible for any save the greatest human virtuosi to achieve.

The bows are automatically rosined. Suspended above the strings is the *rosin box* from which the strings automatically obtain the proper supply of rosin. This box is controlled by a governor and according as the speed of the motor raises or lowers—the greater the bow speed and the closer the box comes to the bows, which by their revolutions against the surface of its rosin, automatically obtain a greater or less supply as required.

Our illustration shows the electrically operated violin, as well as its accompanying player piano. Both instruments playing together, thus give rise to a very creditable musical performance.

ALL KINDS OF LIGHTNING.

(*Continued from page 20*)

denly took it into his head that he was going to take some superlative lightning photos on a certain summer day. In this particular instance, the thunder storm had not been behaving very nicely, according to the photographer's notions, but he thought he would take a chance any way. We might mention before going further, that the thunder storm did not come up in the usual way, and proceed to discharge veritable forked "Bolts of Thor," but satisfied itself with merely hanging around in the offing, and giving a perfect imitation of the best flash, or so-called "heat" lightning, you ever saw. What happened was this. The photographer waited until several of these flashes had occurred and the rain had begun to fall, when he thought the lightning discharges would sharpen up enough to photograph most beautifully. However, he miscalculated the extent and the frequency of the flash lightning, which in this particular case hung on for a long time, and accompanied each flash of forked lightning, which was rather slight in quantity, with the total result that after six 8x10 negatives had been exposed, and then rushed expectantly into the dark room and developed, they showed,—what do you suppose? Well, sir, those six plates turned out to be six of the finest snap-shots of the surrounding landscape and buildings that you ever laid eyes on. By actual comparison you could not tell them from a sunny mid-day snap-shot of the surrounding country taken with the same camera.

Thus the motto would seem to be, that to obtain good lightning photos, one should take advantage of a very dark overhanging storm which gives the greatest contrast of course, for the lightning flashes to appear against. At night would seem to be a most opportune time to photograph lightning discharges, but many excellent pictures have been obtained in the day time as well, under suitable conditions as just outlined.

ELECTRICITY

Taught By a Practical Man
and in Your Home!

I am teaching electricity and electrical drafting to many men, young and old, and trust you will become sufficiently interested after reading this advertisement, that you will send for my catalog which tells what I am endeavoring to do and also places before you the simple way in which the instruction work is handled. The catalog is written in a very plain manner, much in the same style as my lessons are written, and tells you exactly what you get and what the course can do for you. My catalog, as well as my advertisements, is written in a very careful, conservative manner so there is no possibility of you expecting something you will not get.

The Purpose of the Course of Study

I have been designing courses in electrical instruction and teaching electricity, off and on during the past 17 years, and during that time I have had an unusual opportunity to make a special study of the teaching business, from the standpoint of a practical man. This course of my own is designed with a view of reaching those who do not have a lot of time and money to devote to study work, and to give them as thorough a knowledge as possible of electricity, in the shortest possible time. The instruction is given like you were working on various jobs, giving the explanation necessary for the understanding of the theory covered by the subject under discussion. There are many conditions which seldom occur in the every day run of electrical experience, and these conditions I lay particular stress on. This part of the instruction makes the course particularly attractive and valuable to those already engaged in active electrical work.

It Is Up To You

The instruction work is laid out and given in a way easily understood. It is not a cut and dried book plan, but the lessons are prepared especially for the purpose for which they are used and additional instruction is given to the individual student, with a view of meeting his particular needs. I have the information to give and I believe the ability to impart it to others, a fact which is in a way proven by other institutions which have made use of my services in the design and perfecting of instruction courses. To understand this work, IT IS UP TO YOU to stick with me and I will surely stick with you till you understand any part of the work you have gone over.

Practical Men Take My Course and Recommend it to Others

Sixty percent of my students are actively engaged in electrical work and find the instruction I give well suited to their needs. Several of these men have had their fellow workers take the course also and they are taking the instruction together making a class-room proposition of it and the results are in every way satisfactory to all concerned. One of these classes was started by a Chief Electrician, one of my students in Glen White, W. Va., who now has practically all the men under him taking my course. I believe the fact that these men who understand electrical work approve of my course to this extent is one of the strongest endorsements I could get.

What Electrical Men Say Of My Course

In my catalog are letters from men I have taught, some being men I have taught when connected with other institutions years ago, and they are printed with a view of showing you that I have a clear, simple way of getting the information to one so it can be understood. I am printing here extracts from letters received recently from a few of my present students, from which you will note that they are in every way satisfied with the course and the method of handling the instruction.

This letter is from Stanley Dobson, of Moncton, New Brunswick. "I wish to say that I am well pleased with your method of teaching and I trust I will please you as well by my application to the lessons.

"Feeling that in your electrical course you offer a most practical system of training for anyone in the electrical work, I would refer you to a young man here in Moncton from whom you might secure an enrollment in your school. His name is Mr. Walter Stratton.

"I thought I would mention him to you as I have already recommended your school very highly."

This letter is from John Anderson, Farrell, Pennsylvania. "I am writing this so that you may know me better and know I am in earnest in taking this course. I am a foreman in this plant and all I have learned is through practice and that is the reason I want to learn more. The other day the Assistant Chief at this plant said to me that he had taken a course some time ago and I asked him about your course and he advised me to write to you. This man worked under me sometime ago and now I am working under him and I do not want it to happen again."

This letter is from Max Engleman, New York City. "Your first installment on the electrical course received and I went to work and liked the method of your instructions very well. You will find the answers to the examination questions attached to this letter. I am occupied as a waiter and would be only too glad to move into a real trade. Hoping to succeed and thanking you for your help, I am, yours very sincerely, Max Engleman."

This letter is from the same man two months later. "In the book review of the Electrical Experimenter, I saw a discription of the Burgess Blue Book, which I would like to possess and wish you would mail me a copy. I have given up my position as waiter and am now employed as electrician in the Ritz Carlton Hotel and so far like the work very much. With best regards, I am Yours very truly, Max Engleman."

Another letter from Mr. Engleman about a week later. "Your lessons together with your Blue Book received and I thank you very much, and I think it is like everything else that is connected with your name, really 'A No. 1.' My work in the hotel consists of work on motors, dumb waiters and elevators and from time to time I do repair work on small apparatus. Yours sincerely, Max Engleman."

The following is from J. L. Knight, Chief electrician of the coal mines at Glen White, West Virginia, who is taking my course together with a number of men who work under him. "I am just in receipt of your valued letter and am more than pleased with the suggestions and information therein and you can rest assured that I shall do all that is possible for the school and the boys and at the same time learn much myself. Speaking of the lessons, I have never seen anything as interesting as they are, and, as soon as I get a new lesson I get right after it and don't stop until I think I have mastered the subject. Our assistant general manager looked over our lessons last night and he did not hesitate in saying that the lessons were the best that he had ever seen. He is a college man with a number of years' experience in the engineering business and knows a good thing when he sees it and I feel sure that he will write you regarding your work within the next days. We received the returns on the last lessons and all of us are more than pleased with the work that you are giving. I never saw a more enthusiastic bunch of men than they are over the lessons and everyone is buckled down to work and is going to try and make good. For myself, I wish to say that I took a course some years ago in electric railways and lighting and that I have gotten more out of your lessons thus far, and I know that if I live until I complete this course, with the knowledge that I will get out of it connected with the 14 years of practical experience, I shall be able to hold any kind of a position. Your school has a good write-up in the County paper this week and I have seen that due credit was given Mr. Yorke Burgess. I will send you a copy of this as soon as it is out. All of the boys are better pleased every day with the lessons and there is nothing but compliments for the Burgess Electrical School in this little town of Glen White."

Fifty Fifty

I work absolutely on a 50-50 basis with my students. You pay me the comparatively low price I ask, and I give you the instruction and other help as is stated in my catalog. No student is permitted to pay cash for his entire course on starting, the course being paid for in small monthly payments as you go along. Students have the privilege of discontinuing the work if they should find that it was not just what they were after, and their payments stop at the same time. This is my way of doing business and I would not want your money when I was not giving you the instruction.

Apparatus, Instruments, Material, Etc.

Certain electrical apparatus, instruments, material, charts, drafting implements, etc., as detailed in the catalog, are included in the course and are a part of the regular instruction for which there is no extra charge as it is covered by the regular monthly payments.

"The Joy of Father and Boy."

"ELECTRO"

Chemical Laboratory

We present herewith to our friends our new **E. I. Co. Chemical Laboratory** which contains real chemicals and apparata to perform real chemical experiments. This outfit is not a toy, put up merely to amuse, but a practical laboratory set, with all the chemicals, apparata and reagents necessary to perform real work and to teach the beginner all the secrets of inorganic chemistry. With this outfit we give free a book containing a **Treatise in Elementary Chemistry, useful data and recipes, and 100 instructive and amusing experiments.**

It contains the following 44 chemicals:

Alum $Al_2(SO_4)_3$, $(NH_4)_2SO_4$
Antimony (powdered) (Sb)
Ammonium Aqua (NH_3+H_2O)
Ammonium Carbonate $(NH_4)_2\ CO_3$
Ammonium Chloride (NH_4Cl)
Ammonium Sulphate $(NH_4)_2\ SO_4$
Barium Chloride $(BaCl_2)$
Boric Acid (H_3BO_3)
Brimstone (Sulphur) (S)
Calcium Chloride $(CaCl_2)$
Calcium Oxide (CaO)
Calcium Sulphate $(CaSO_42H_2O)$
Charcoal (Carbon) (C)
Chloride of Zinc $(ZnCl_2)$
Copper Sulphate $(CuSO_4)$
Ferrous Sulphate $(FeSO_4)$
Ferrous Sulphide (FeS)
Glycerol (Glycerine) $C_3H_5(OH)_3$
Hydrochloric Acid (HCl)
Iodine (I)
Iron Chloride $(FeCl_2)$
Iron Oxide (Fe_2O_3)
Lead Acetate Pb $(C_2H_3O_2)_2$
Litmus Paper
Magnesium Carbonate $(MgCO_3)$
Manganese Dioxide (MnO_2)
Mercury (Quicksilver) (Hg)
Nickel Chloride $(NiCl_2)$
Oxalic Acid $(H_2C_2O_4)$
Sodium Bicarbonate $(NaHCO_3)$
Sodium Borate $(NaBO_2)$
Sodium Carbonate (Na_2CO_3)
Sodium Chloride (NaCl)
Sodium Nitrate $(NaNO_3)$
Sodium Phosphate (Na_2HPO_4)
Sodium Sulphate (Na_2SO_4)
Sodium Sulphite (Na_2SO_3)
Stannous Chloride $(SnCl_2)$
Sulphate of Nickel $(NiSO_4)$
Sulphate of Zinc $(ZnSO_4)$
Sulphuric Acid (H_2SO_4)
Tin (Granulated) (Sn)
Zinc (Metal) (Zn)
Zinc Carbonate $(ZnCO_3)$

The following apparata are furnished:

One Standard Washbottle
One Alcohol Lamp
One Conical Glass Measure
One Erlenmeyer Flask
One Glass Funnel
One Delivery Tube
Six Assorted Test-Tubes
One Test-Tube Holder
Ten Sheets of Filter Paper
One Glass Dropper
One Spoon Measure
Glass Tubing
One book containing Treatise on Elementary Chemistry and 100 Chemical Experiments to be performed with this outfit.

DESCRIPTION OF THE OUTFIT:

The outfit consists of forty-four (44) Chemicals all C. P. (chemical pure) put up in appropriate wooden boxes, glass bottles, and hermetically closed jars. The acids are put up in glass bottles, with ground-in glass stoppers and there is a sufficient quantity of chemicals supplied (mostly one to two ounces) enough to make dozens of experiments with each. See list of Chemicals herewith.

The apparata furnished are all of the best obtainable make and of standard laboratory size and shape. A list of the 17 pieces of apparata furnished with this outfit is printed also herewith.

The Instruction book is a real Chemistry Course for the Beginner. Some of the Contents are: **Division of Matter:** This is a Treatise on Elementary Chemistry and deals with the theory of the Elements, Molecules and Atoms, etc. **Chemical Nomenclature.** This explains in simple language the derivation of the chemical names of the Elements and their compounds. There is a chapter on **Laboratory Operations; Glass Working; First Aid; Fire Extinguishers; Experimenters' Aphorisms,** etc.

A good part of the book is devoted to Weights and Measures. The Metric System, the English system and the U. S. System are fully explained.

The following tables are furnished: Symbols and Atomic weights of the Elements; Measures of Weights, Volume, Capacity and Length; Per Cent solutions; Conversion of Measure expressed in parts; Poisons and their antidotes; Technical and common name of chemical substances; Formulas for Cleaning various substances, etc., etc.

Among the 100 Experiments are:

How to make chemical tricks; How to make invisible and magic inks; How to test flour; How to test soil; How to Make Chlorine Gas and smoke (German War Gas); How to bleach cloth and flowers. How to produce Oxygen and Hydrogen; How to make chemical colors; How to test Acids and Alkalies and hundreds of interesting hints and formulas.

The price is still $5.00

Shipping Weight 10 lbs.

Will Man Freeze the Earth to Death?

(*Continued from page 8*)

Rising prices and increasing scarcity surely will drive us to other fuels. Alcohol has been cited as a probability, mainly because it can be produced anywhere crops are grown. The truth of this matter is that if the fuel requirements of the world were to be supplied by the world's crops there would be no crops left to feed the world's inhabitants.

The final summation simply is that when coal and oil both give out we will have an era of substitutes beside which the war bread of the past year will be heavenly. We will scratch around, burn up all our forests, dig our peat bogs to the bottom, and do what we can to find other substances to supply the deficiency. All the substitutes will be costly, both from point of view of actual price and in point of efficiency. Those who cannot afford to use them will simply have to move toward the equator or freeze to death.

Radium is the one direct answer to the problem raised by this situation. True, it exists only in minute quantities in the earth's crust. True, under our present system of extraction it costs prohibitively. Still, it is the only logical answer.

Why? While radium is present only in proportions of from one to three grains per ton in the outer thirty miles of the earth's crust—excluding the oceans, of course, in which there is only a trace—there is sufficient of it in the upper two miles of crust to supply all possible power wants of man. The fact that it now costs us over a half-million dollars a pound to extract it is no argument. The scientific brains of the world never has been focust on the problem of securing radium. Only the inventive skill of a small number of people has been concerned with the processes of mining and extracting any kind of precious metal. With only a few dozen laboratories in the world knowing anything whatever about radium, the cost of securing the metal has been *cut in half in the last four years.* In the event that radium showed itself to be the only salvation for men outside of the equatorial zone, would not this cost be slaughtered? Would not radium be extracted by the ton instead of by the milligram? When it is considered that by the extraction of all the radium in a belt of land, ten miles wide by three miles deep, extending around the earth sufficient of the metal would be secured to run civilization just as it stands until eternity, without further outlay for power of any kind, does this seem impossible? It would be an undertaking for centuries, undoubtedly, but what of it? There would be little or no depreciation in the metal secured year by year, and every tiny particle mined and extracted would do away with the necessity for just so much other fuel. In case the project were started under Government or other competent supervision, the probability would be strong that the descending price curve of radium would cross the rising cost curve of other fuels in the course of from fifty to one hundred years.

The only alternative to this desperate plan that seems to be offered to our descendants is the piping of steam and hot air from the earth's interior. On a small scale this has been done already in Italy, but scientists have pointed out that serious disturbances, earthquakes, cracking of the crust and other disasters involving huge losses of human life would be certain to follow the experiment of trying this on a large scale. The trouble mainly would be caused by the sudden cooling of certain portions while the other parts remained in a molten state. The great catastrophe of a tremendous crack appearing in the middle of the Pacific Ocean, with the resultant clouds of live steam and poison gas covering the earth and killing all animal and vegetable life, would be the great debacle most to be dreaded. Taking all into consideration, radium seems like the best and safest possibility.

One strange possibility which has an equally queer parallel in the case of radium extraction on a large scale is the quick doom which would face the earth if men piped all their heat from the earth's interior. Providing millions of these vents for power uses on all continents would cool the iron center of the earth speedily.

Under the present scheme of things, Professor Maurier estimates that the earth will cool to the temperature of the moon (—110 degrees Centigrade) in twenty-eight million years. Human life as we know it will have been extinct, in all probability, for twelve or thirteen million years of this term, unless man finds some material in which to clothe himself thru which body heat cannot pass, and grows his crops in huge heat-insulated greenhouses.

If the vents were opened, however, the heat of the earth's center would flood the atmosphere, even if used as economically as possible. It would rise to the outer edges of our air, coming into contact with the bleak (absolute zero) temperatures of the void, and cooling. Instead of the gradual change extending over millions of years, man would be confronted by a situation to which he probably could not adapt himself. The end of the world would come in ten thousand, yes, perhaps in five thousand years.

Even if the radium power system were inaugurated, something similar might take place, tho by no means as suddenly. Radium apparently was placed in the earth's crust for one particular purpose. That was to keep the earth from cooling off quickly.

We have seen that twenty pounds of radium would equal nine tons of anthracite in a year's time. The amount of radium in the thirty-mile crust of the earth, according to Professor Henri Becquerel of the French Academy, *is sufficient almost to equalize the daily loss of heat thru the atmosphere!* That means that if there were a little more radium in the earth this planet never would cool off at all! Also it means that if the earth were of the same consistency all the way thru, and not mostly molten iron or steel, the amount of radium being of the same proportion as at the surface, the globe would get hotter constantly. In the course of a few decades or centuries it would burst into flames and burn to a cinder.

The big point for us to grasp, however, lies in the fact that we are living now on earth solely because the crust contains radium. If this had not been the case the earth would have become cold and dead eons ago. If man, for any reason, becomes so grasping or in such dire necessity that he extracts all of the radium from the crust, he simply will be limiting his chances of a long stay very definitely.

This, however, is a remote possibility. The radium is scattered thru the whole crust to an average depth of *thirty miles.* Below this there is a highly heated tho solid zone in which there probably is a certain amount of radium. This zone extends *eighty miles* in depth, and below it is molten iron, the *core* of the earth. Man will have his hands full extracting the radium from the upper two or three miles of the crust. Since this will give him all he ever can need, unless the demands of future civilization grow much faster than any of our estimates figure, he would not touch the greater portion.

EARN $35 TO $100 PER WEEK

As a Mechanical Draftsman

Thousands of Men Wanted

You can learn Mechanical Drawing at home in your spare time through our practical Home Study Course and qualify for Big Pay. We have placed hundreds of our students in good paying positions. Government departments and private concerns are continually calling upon us for our graduates.

Become a Chief Draftsman

and get to the very top in this well-established and rapidly growing profession. The training given by the Columbia School of Drafting will give you just the knowledge you need to make good as a Chief Draftsman. No previous training is necessary. You can begin our course now and make rapid progress from the start under the Personal Instruction of the President of the School, Mr. Claflin, by mail. His carefully prepared lessons and personal letters of advice make each step easy and interesting.

Draftsmen Now Getting $35 to $100 a Week

with big chances for better pay as the demand grows. All big engineering, construction and manufacturing projects must first go through the drafting room before the workmen can commence. All such enterprises depend upon large numbers of draftsmen. Salaries are advancing steadily.

Drawing Outfit Free with Our Course

As soon as you enroll you will be sent our drawing outfit for your own use throughout the course. This entire outfit will be yours to keep. You are not obliged to return it after completing the course.

Not Only a Correspondence School

The Columbia School of Drafting is probably the largest residence school in the country specializing in the training of professional Draftsmen. Our Home Study Courses are an extension of the same instruction as given locally.

Illustrated Catalog FREE

Simply fill in the coupon below, return it to us and we will send you free a copy of our illustrated catalog which tells all about our practical Home Study Course and how you may secure our instructions at once on easy terms so as to quickly qualify for one of the big positions open.

Send This Coupon Today.

COLUMBIA SCHOOL OF DRAFTING
Dept. 982, 14th and T Sts., Washington, D. C.

Without obligation to me, please send me your Illustrated Catalog and tell how I may secure your practical training in Drafting and your help in securing a position as Draftsman.

"The National Authority on Electric Wiring for Twenty-Five Years"

All You Need to Know About Wiring

is in the Latest Edition of

"Standard Wiring"

THIS year's edition, completely revised to date, is the only accurate book on electric light and power wiring and construction published.

The National Electrical Code, with all its new rules, is explained and illustrated. 52 of the latest and simplest tables which show, at a glance, just what size of wire is needed for any kind and size of lighting or motor installation, for any voltage, current and drop desired for any system. Direct Current, Alternating Current, single, two or three-phase. The latest Code Rules on grounding required on all work.

How to install and operate generators, motors and every kind of wiring device with diagrams of connections. Special chapters on illumination, House Wiring, Electrical Units and their Equivalents. The latest lamp data. Proper symbols to use to indicate outlets, etc., etc.

It Will Make You an Expert Wireman

Leather Cover - Pocket Size - 375 Pages - Price $1.50

Sent to any address, postpaid, on receipt of price

H. C. Cushing, Jr., 10 West 40th St., New York

FREE TO THE RUPTURED

DON'T WEAR A TRUSS

FREE TRIAL

Inner surface made self-adhesive purposely to prevent slipping and to keep constantly applied the absorbent-astringent medication called PLAPAO. Close the hernial opening as nature intended so the Rupture CAN'T come down.

Do Away With Steel and Rubber Bands That Chafe and Pinch

You know by your own experience that the truss is a mere makeshift—a false prop against a collapsing wall—and that it is undermining your health. Why, then, continue to wear it? STUART'S PLAPAO-PADS are entirely different—being medicine applicators made self-adhesive purposely to prevent slipping and to hold the distended muscles securely in place. No straps, buckles or springs attached. No "digging in" or grinding pressure. Soft as Velvet—Flexible—Easy to Apply—Inexpensive. Continuous day and night treatment at home. No delay from work. Hundreds of people, old and young, have gone before an officer qualified to acknowledge oaths, and swore that the PLAPAO-PADS cured their Ruptures—some of them most aggravated cases—and of long standing.

Send Today For FREE PLAPAO--No Charge for it--Now or Ever

Simply write your name and address below. Send this advertisement for absolutely FREE TRIAL PLAPAO and 48-page Book on Rupture. No charge for it—now or ever. Nothing to be returned. "Be wise today 'tis madness to defer." Address, PLAPAO CO., Block 844, St. Louis, Mo.

GREEN AUTOMATIC MACHINE

ADD TO YOUR INCOME

WITH LITTLE EFFORT $5 to $10 A DAY MADE EASY WITH

New Improved Green Automatic Machine

Sharpens, Hones and Strops all kinds of safety razor blades, in one operation, from four to six blades per minute. For both Quality and Quantity, this machine is in a class by itself. There is nothing like it on the market. Let us send you our free booklet explaining everything including the "AMERICAN" Key Cutter—cuts square, angular or round slots.

AMERICAN SHARPENING MACHINE CO. (Inc.), Dept E E, 184 W. Washington St., CHICAGO

"AMERICAN" Key Cutter

New York Aëro Show

(*Continued from page* 19)

ily imagined for the visitor was shown a complete composite photographic map of the city of Washington, D.C., which was taken from an airplane in a trip lasting but two hours and fourteen minutes. Hundreds of photos are taken by the rapid-fire cameras, and after developing and printing these have to be evenly matched and assembled. Large photographs taken about New York along the river, showing the ferry boats, etc., were taken during the afternoons of the different days, and the plates would be rushed to the aëro show, there developed and finished and prints made by the Army's photographic experts, the mounted photographs being on exhibit at the show in from one hour to an hour and one-half after they had been taken by the aviator flying above the city.

The machine gun exhibit attracted much attention, particularly the means used for synchronizing two machine guns on the battle-planes, so that they both fired dead ahead and thru the revolving propeller, the bullets passing accurately thru the spaces between the blades every time these spaces came in line with the machine gun barrels. The Packard Automobile Company, makers of the well-known Packard motor car, exhibited a new pleasure and battle-plane fitted with the Packard 12-cylinder aircraft engine, which somewhat resembles the Liberty motor. The Liberty motor, which was on exhibit, attracted considerable attention, and the number of these motors built by each of the large automobile concerns during the war were shown. There was a large sea-plane on exhibit which had flown to the show.

Speed enthusiasts in the flying world had their attention riveted on what was purported to be the fastest airplane in the world, the "Christmas Bullet," a small model of which was exhibited at the Aero Show. It was very well built, and the most remarkable feature of the design of the "Bullet" is that there are no struts between the planes, and also there are no guy wires, as in the usual types of monoplanes. The wings are supported by the cantilever principle, and besides they are *flexible*. The "Christmas Bullet" bi-plane is guaranteed to make 200 miles an hour, and it attained a speed of over 185 miles per hour on a recent trial flight, when equipt with a six-cylinder 185 H.P. Liberty motor. It is claimed by its builders to be the safest and fastest airplane in the world. Not only this, but its lifting capacity compared to its size is greater than that of any other 'plane, it is stated. As will be evident, this ingenious design of 'plane is constructed on the principle of true bird flight, which therefore makes it self-balancing and serviceable in any kind of weather. The wing surface is 170 square feet, and the total weight is 2,100 pounds, which includes fuel for three hours.

This airplane is intended to play the rôle of the first "taxi-plane" ever used in steamship service, and is to be operated at the port of New York by one of the leading steamship companies for overtaking a ship a day out at sea with sacks of belated mail, dispatches, etc.

Among the interesting airplane engines exhibited at the Show was the well-known "Dusenberg." This Company exhibited a powerful new model 12-cylinder aircraft engine, in which each set of six cylinders operated a separate crank shaft of its own. The power from the individual crank shafts was then transmitted to the propeller shaft by means of two gears, one on each side of the main driving gear secured to the propeller shaft.

The True Wireless

By Nikola Tesla

(Continued from page 30)

trates an arrangement described in my U. S. Patent No. 568178 of September 22, 1896, and corresponding dispositions of wireless apparatus. The captions of the individual diagrams are thought sufficiently explicit to dispense with further comment. I will merely remark that in this early record, in addition to indicating how any number of resonant circuits may be linked and regulated, I have shown the advantage of the proper timing of primary impulses and use of harmonics. In a farcical wireless suit in London, some engineers, reckless of their reputation, have claimed that my circuits were not at all attuned; in fact they asserted that I had looked upon resonance as a sort of wild and untamable beast!

It will be of interest to compare my system as first described in a Belgian patent of 1897 with the Hertz-wave system of that period. The significant differences between them will be observed at a glance. The first enables us to transmit economically energy to any distance and is of inestimable value; the latter is capable of a radius of only a few miles and is worthless. In the first there are no spark-gaps and the actions are enormously magnified by resonance. In both transmitter and receiver the currents are transformed and rendered more effective and suitable for the operation of any desired device. Properly constructed, my system is safe against static and other interference and the amount of energy which may be transmitted is *billions of times greater* than with the Hertzian which has none of these virtues, has never been used successfully and of which no trace can be found at present.

A well-advertised expert gave out a statement in 1899 that my apparatus did not work and that it would take 200 years before a message would be flashed across the Atlantic and he even accepted stolidly my congratulations on a supposed great feat. But subsequent examination of the records showed that my devices were secretly used all the time and ever since I learned of this I have treated these Borgia-Medici methods with the contempt in which they are held by all fair-minded men. The wholesale appropriation of my inventions was, however, not always without a diverting side. As an example to the point I may mention my oscillation transformer operating with an air gap. This was in turn replaced by a carbon arc, quenched gap, an atmosphere of hydrogen, argon or helium, by a mechanical break with oppositely rotating members, a mercury interrupter or some kind of a vacuum bulb and by such *tours de force* as many new "systems" have been produced. I refer to this of course, without the slightest ill-feeling, let us advance by all means. But I cannot help thinking how much better it would have been if the ingenious men, who have originated these "systems," had invented something of their own instead of depending on me altogether.

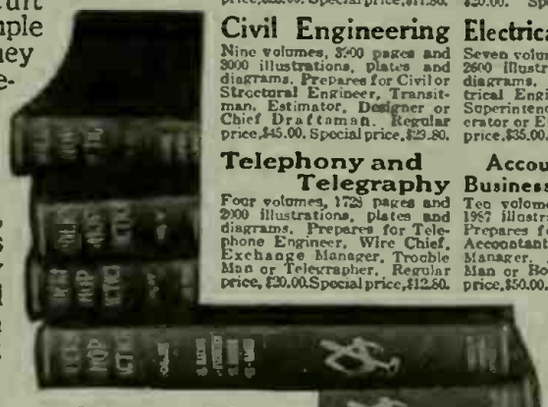
Before 1900 two most valuable improvements were made. One of these was my individualized system with transmitters emitting a wave-complex and receivers comprising separate tuned elements cooperatively associated. The underlying principle can be explained in a few words. Suppose that there are n simple vibrations suitable for use in wireless transmission, the probability that any one tune will be struck by an extraneous disturbance is $\frac{1}{n}$. There will then remain $n-1$ vibrations and the chance that one of these will be excited is $\frac{1}{n-1}$, hence the probability that two tunes would

WANTED!

OFFICE MEN
Auditors, Accountants, Office Managers, Credit Men, Cashiers, Bookkeepers and Cost Clerks—$1,200 to $7,500.

FACTORY MEN
Electrical and Mechanical Engineers, Factory Managers, Superintendents, Foremen, Designers, Draftsmen—$1,500 to $12,000.

CONSTRUCTION MEN
Civil and Structural Engineers, Transitmen, Construction Superintendents and Foremen, Estimators, Designers and Draftsmen—$1,200 to $10,000.



TRADES—Machinists and Toolmakers, Auto Repairers, Electricians, Stationary Engineers, Firemen, Plumbers, Carpenters, etc.—$1,200 to $2,000.

All these positions were advertised in a single issue of a Chicago newspaper

Which Job Can You Fill?

Which one of them could *you* fill? If you haven't the knowledge necessary to break into the *big-pay class*, decide to *get that knowledge NOW!* Any of the books listed below will quickly fit you for a well-paid job—at home—in your spare time.

These books were written by experts in plain, everyday language. They are free from puzzling technical terms. Numerous illustrations, diagrams and tables make difficult points as simple as A-B-C. They are handsomely bound in half or full leather (except Law and Practice, which is bound in law buckram) and stamped in gold. Fill out the coupon.

Carpentry and Contracting
Five volumes, 2138 pages and more than 400 illustrations. Prepares for Contractor, Building Superintendent and Carpenter Foreman. Regular price, $25.00. Special price, $17.80.

Fire Prevention and Insurance
Four volumes, 1500 pages and 600 illustrations, diagrams, forms, etc. Prepares for Counterman, Rate Clerk, Inspector or Agent. Regular price, $20.00. Special price, $15.80.

Civil Engineering
Nine volumes, 3500 pages and 3000 illustrations, plates and diagrams. Prepares for Civil or Structural Engineer, Transitman, Estimator, Designer or Chief Draftsman. Regular price, $45.00. Special price, $29.80.

Electrical Engineering
Seven volumes 3000 pages and 2600 illustrations, plates and diagrams. Prepares for Electrical Engineer, Power Plant Superintendent, Substation Operator or Electrician. Regular price, $35.00. Special price, $19.80.

Telephony and Telegraphy
Four volumes, 1728 pages and 2000 illustrations, plates and diagrams. Prepares for Telephone Engineer, Wire Chief, Exchange Manager, Trouble Man or Telegrapher. Regular price, $20.00. Special price, $12.80.

Accountancy and Business Management
Ten volumes, 3680 pages and 1987 illustrations, forms, etc. Prepares for Certified Public Accountant, Auditor, Office Manager, Accountant, Credit Man or Bookkeeper. Regular price, $50.00. Special price, $24.80.

Automobile Engineering
Five volumes, 2400 pages and 2000 illustrations. Prepares for Garage Foreman, Automobile Mechanic or Chauffeur. Invaluable to car owners. Regular price, $25.00. Special price, $17.80.

Steam and Gas Engineering
Seven volumes, 3300 pages and 2500 illustrations, plates, diagrams, etc. Prepares for Stationary, Marine or Locomotive Engineer or Fireman. Regular price, $35.00. Special price, $21.80.

Machine Shop Practice
Six volumes, 2200 pages and 2500 illustrations. Prepares for Machine Shop Superintendent or Foreman, Foundryman, Pattern Maker, Tool Designer or Tool Maker. Regular price, $30.00. Special price, $19.80.

Law and Practice
(with Reading Course in 25 bound pamphlets). Thirteen volumes, 6000 pages and 24 illustrations. Prepares for all Bar Examinations. A wonderful aid to business men. Regular price, $72.00. Special price, $39.80.

Sanitary, Heating and Ventilating Engin'ring
Four volumes, 1454 pages and more than 1400 illustrations, etc. Prepares for Sanitary Engineer, Heating and Ventilating Engineer, Master Plumber or Plumber. Regular price, $20.00. Special price, $13.80.

Practical Accounting
Four volumes, 1840 pages and 800 illustrations, plates and diagrams. C. P. A. questions and practical problems. Prepares for Accountant, Bookkeeper or Cost Clerk. Regular price, $20.00. Special price, $12.80.

One Week Free Trial

We'll gladly send you any set for seven days' examination. Don't send us a penny; just pay the small shipping charge when the books arrive. Examine them carefully—use them at your work for an entire week. At the end of that time, if you feel they aren't worth far more than we ask, return them *at our expense*. If you keep them, pay the bargain price on the easy terms explained below.

American Technical Society
Dept. X3385 Chicago, U. S. A.

50c A WEEK

Yes, if you decide to keep the set you have selected, send $2 within seven days and then $2 a month (*50c a week*) until the present low price has been paid. Have you ever heard of a more generous offer? Remember, you take no chances whatever—we send the books for examination and you are not obliged to keep them if you do not care to buy. Mail the coupon *now*—before you turn the page.

American Technical Society, Dept. X3385, Chicago, Ill.

Please send me set of ..... for 7 days' examination, shipping charges collect. I will examine the books thoroughly and, if satisfied, will send $2 within 7 days and $2 each month until I have paid the special price of ..... If I decide not to keep the books, I will return them by express at your expense. Title not to pass to me until the set is fully paid for.

www.americanradiohistory.com

The Ellis "Music Master" Reproducer

Will make your Talking Machine "The Soul of the Living Artist"

NO ordinary sound-box can reproduce a composition as originally played or sung by the artist. The true tone coloring is lacking—the beautiful overtones completely lost. And if not perfectly adjusted the ordinary reproducer vibrates, causing a harsh and shrill tone so commonly associated with mechanical music.

But with the Ellis "Music Master" Reproducer all this is changed. Every shade of expression that originally went into the record is faithfully and accurately reproduced. By its special, improved features and construction all harsh discordant sounds are eliminated and the music flows out in a clear, round tone exactly as if the artist himself were in your home, playing or singing at his very best.

You must hear the "Music-Master" to apppreciate its great merit

It took 10 years of hard study and constant experimenting to develop this one reproducer that faithfully brings to life all there is in the record.

Words cannot convey to you an adequate idea of how much this wonderful device will do to improve the playing of records. You must see it—hear it—compare the effect with any and all other reproducers you know of; then you will understand why every music-lover owner of a phonograph who hears the "Music-Master" Reproducer wants to own one.

For all machines—Plays all Records

No matter what style, size or make of talking machine you have if it uses disc records you can use the Ellis "Music-Master" and enjoy the *real* music. Easily put on, it prolongs the life of the records, because it is much lighter in weight than other reproducers. And the price is so low that you cannot afford to be without it—it will double the worth of your instrument.

Write today for full details

Thousands of satisfied users attest to the *real* value of my reproducer. I want to send you some of their letters and tell you more about my "Music-Master". Fill in and mail the coupon below for full particulars. Ask for Circular E.

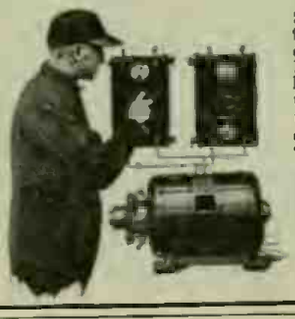
be struck at the same time is $\frac{1}{n(n-1)}$. Similarly, for a combination of three the chance will be $\frac{1}{n(n-1)(n-2)}$ and so on. It will be readily seen that in this manner any desired degree of safety against the statics or other kind of disturbance can be attained provided the receiving apparatus is so designed that its operation is possible only thru the joint action of all the tuned elements. This was a difficult problem which I have successfully solved so that now *any desired number of simultaneous messages is practicable in the transmission thru the earth as well as thru artificial conductors.*

The other invention, of still greater importance, is a peculiar oscillator enabling the transmission of energy without wires in any quantity that may ever be required for industrial use, to any distance, and with very high economy. It was the outcome of years of systematic study and investigation and wonders will be achieved by its means.



The prevailing misconception of the mechanism involved in the wireless transmission has been responsible for various unwarranted announcements which have misled the public and worked harm. By keeping steadily in mind that the transmission thru the earth is in every respect identical to that thru a straight wire, one will gain a clear understanding of the phenomena and will be able to judge correctly the merits of a new scheme. Without wishing to detract from the value of any plan that has been put forward I may say that they are devoid of novelty. So for instance in Fig. 12 arrangements of transmitting and receiving circuits are illustrated, which I have described in my U. S. Patent No. 613809 of November 8, 1898 on a Method of and Apparatus for Controlling Mechanism of Moving Vessels or Vehicles, and which have been recently dished up as original discoveries. In other patents and technical publications I have suggested conductors in the ground as one of the obvious modifications indicated in Fig. 5.

For the same reason the statics are still the bane of the wireless. There is about as much virtue in the remedies recently proposed as in hair restorers. *A small and compact apparatus has been produced which does away entirely with this trouble,* at least in plants suitably remodelled.

Nothing is more important in the present phase of development of the wireless art than to dispose of the dominating erroneous ideas. With this object I shall advance a few arguments based on my own observations *which prove that Hertz waves have little to do with the results obtained even at small distances.*

In Fig. 13 a transmitter is shown radiating space waves of considerable frequency. It is generally believed that these waves pass along the earth's surface and thus affect the receivers. I can hardly think of anything more improbable than this "gliding wave" theory and the conception of the "guided wireless" which are contrary to all laws of action and reaction. Why should these disturbances cling to a conductor where they are counteracted by induced currents, when they can propagate in all other directions unimpeded? The fact is that the radiations of the transmitter passing along the earth's surface are soon extinguished, the height of the inactive zone indicated in the diagram being some function of the wave length, the bulk of the waves traversing freely the atmosphere. Terrestrial phenomena which I have noted conclusively show that there is no *Heaviside layer,* or if it exists, it is of no effect. It certainly would be unfortunate if the human race were thus imprisoned and forever without power to reach out into the depths of space.

Make Big Profits in Battery Charging

$150 to $250 Clear Profit Each Month recharging auto storage batteries. The HB 16-Battery Charger recharges 1 to 16 6-volt batteries or their equivalent at once with current cost of 12c to 15c per battery. Motorist pays 75c to $1.50. Figure your profits! This season means bigger battery business than ever—more old cars driven—new Fords to have storage batteries. Get busy now! Don't delay! Start after those profits!

$57 Puts This Money-Maker in Your Garage on Money-Back Guarantee

Balance in 10 monthly payments of $23. each. Earnings pay for machine. No electrical knowledge necessary to operate. Uses 2 or 3 phase city current. Furnished complete with 2 charging panels capable of charging 1 to 8 batteries each. No adjustments or expensive renewals. Big, permanent profits. Sold on HB Absolute Money Back Guarantee. Order Now—you run no risk. Pin your check to this ad and mail today for trial order. Do it NOW!

www.americanradiohistory.com

The actions at a distance cannot be proportionate to the height of the antenna and the current in the same. I shall endeavor to make this clear by reference to diagram in Fig. 14. The elevated terminal charged to a high potential induces an equal and opposite charge in the earth and there are thus Q lines giving an average current $I = 4Qn$ which circulates locally and is useless except that it adds to the momentum. A relatively small number of lines q however, go off to great distance and to these corresponds a mean current of $i = 4qn$ to *which is due the action at a distance.* The total average current in the antenna is thus $I_m = 4Qn + 4qn$ and its intensity is no criterion for the performance. The electric efficiency of the antenna is $\frac{q}{Q+q}$ and this is often a very small fraction.

Dr. L. W. Austin and Mr. J. L. Hogan have made quantitative measurements which are valuable, but far from supporting the Hertz wave theory they are evidences in disproval of the same, as will be easily perceived by taking the above facts into consideration. Dr. Austin's researches are especially useful and instructive and I regret that I cannot agree with him on this subject. I do not think that if his receiver was affected by Hertz waves he could ever establish such relations as he has found, but he would be likely to reach these results if the Hertz waves were in a large part eliminated. At great distance the space waves and the current waves are of equal energy, the former being merely an accompanying manifestation of the latter in accordance with the fundamental teachings of Maxwell.

It occurs to me here to ask the question—why have the Hertz waves been reduced from the original frequencies to those I have advocated for my system, when in so doing the activity of the transmitting apparatus has been reduced a billion fold? I can invite any expert to perform an experiment such as is illustrated in Fig. 15, which shows the classical Hertz oscillator and my grounded transmitting circuit. It is a fact which I have demonstrated that, altho we may have in the Hertz oscillator an activity thousands of times greater, the effect on the receiver is not to be compared to that of the grounded circuit. This shows that *in the transmission from an airplane we are merely working thru a condenser,* the capacity of which is a function of a logarithmic ratio between the length of the conductor and the distance from the ground. The receiver is affected in exactly the same manner as from an ordinary transmitter, the only difference being that there is a certain modification of the action which can be predetermined from the electrical constants. It is not at all difficult to maintain communication between an airplane and a station on the ground, on the contrary, the feat is very easy.

To mention another experiment in support of my view, I may refer to Fig. 16 in which two grounded circuits are shown excited by oscillations of the Hertzian order. It will be found that the antennas can be put out of parallelism without noticeable change in the action on the receiver, this proving that it is due to currents propagated thru the ground and not to space waves.

Particularly significant are the results obtained in cases illustrated in Figures 17 and 18. In the former an obstacle is shown in the path of the waves but unless the receiver is within the effective *electrostatic* influence of the mountain range, the signals are not appreciably weakened by the presence of the latter, because the currents pass under it and excite the circuit in the same way as if it were attached to an energized wire. If, as in Fig. 18, a second range happens to be beyond the receiver, it could only strengthen the Hertz wave effect by reflection, but as a matter of fact it detracts

(Continued on page 87)

Learn Public Speaking

10 LESSONS FREE

Write — quick — for particulars of this extraordinary offer; an opportunity you will never forget if you take advantage of it. Ten lessons in effective public speaking absolutely FREE to those who act promptly, to introduce our course in localities where it is not already known.

We teach you by mail to become a powerful and convincing speaker—to influence and dominate the decisions of one man or an audience of a thousand. We have trained hundreds and helped them to increase their earnings and their popularity. Learn, in your spare time at home, how to overcome "stage fright" and conquer fear of others; how to enlarge your vocabulary; how to develop self-confidence and the qualities of leadership; how to RULE others by the power of your speech alone; how to train your memory. Our

WHAT THE COURSE TEACHES YOU.

How to talk before your club or lodge;
How to address board meetings;
How to propose and respond to toasts;
How to make a political speech;
How to tell entertaining stories;
How to make after-dinner speeches;
How to converse interestingly;
How to write better letters;
How to sell more goods;
How to train your memory;
How to enlarge your vocabulary;
How to develop self-confidence;
How to acquire a winning personality;
How to strengthen your will power and ambition;
How to become a clear, accurate thinker;
How to develop your power of concentration;
How to be the master of any situation.

New Easy Method

perfected and taught only by Prof. R. E. Pattison Kline, former Dean of the Public Speaking Department of the Columbia College of Expression, can be learned in 15 minutes a day. Prof. Kline is one of the foremost authorities in the country on public speaking and mental development. Do not let this chance escape you.

My Inventions

(Continued from page 17)

lamp there. It was the exact spot which I had originally chosen.

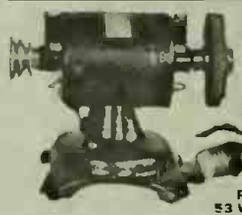
So it went day after day with variations, but I was determined to achieve at whatever cost and in the end my efforts were rewarded. By the spring of 1884 all the differences were adjusted, the plant formally accepted, and I returned to Paris with pleasing anticipations. One of the administrators had promised me a liberal compensation in case I succeeded, as well as a fair consideration of the improvements I had made in their dynamos and I hoped to realize a substantial sum. There were three administrators whom I shall designate as A, B and C for convenience. When I called on A *he* told me that B had the say. This gentleman thought that only C could decide and the latter was quite sure that A alone had the power to act. After several laps of this *circulus vicious*, it dawned upon me that my reward was a castle in Spain. The utter failure of my attempts to raise capital for development was another disappointment and when Mr. Batchellor prest me to go to America with a view of redesigning the Edison machines, I determined to try my fortunes in the Land of Golden Promise. But the chance was nearly mist. I liquefied my modest assets, secured accommodations and found myself at the railroad station as the train was pulling out. At that moment I discovered that my money and tickets were gone. What to do was the question. Hercules had plenty of time to deliberate but I had to decide while running alongside the train with opposite feelings surging in my brain like condenser oscillations. Resolve, helped by dexterity, won out in the nick of time and upon passing thru the usual experiences, as trivial as unpleasant, I managed to embark for New York with the remnants of my belongings, some poems and articles I had written, and a package of calculations relating to solutions of an unsolvable integral and to my flying machine. During the voyage I sat most of the time at the stern of the ship watching for an opportunity to save somebody from a watery grave, without the slightest thought of danger. Later when I had absorbed some of the practical American sense I shivered at the recollection and marvelled at my former folly.

Tesla in America

I wish that I could put in words my first impressions of this country. In the Arabian Tales I read how genii transported people into a land of dreams to live thru delightful adventures. My case was just the reverse. The genii had carried me from a world of dreams into one of realities. What I had left was beautiful, artistic and fascinating in every way; what I saw here was machined, rough and unattractive. A burly policeman was twirling his stick which looked to me as big as a log. I approached him politely with the request to direct me. "Six blocks down, then to the left," he said, with murder in his eyes. "Is this America?" I asked myself in painful surprise. "It is a century behind Europe in civilization." When I went abroad in 1889—five years having elapsed since my arrival here—I became convinced that *it was more than one hundred years AHEAD of Europe* and nothing has happened to this day to change my opinion.

Tesla Meets Edison

The meeting with Edison was a memorable event in my life. I was amazed at this wonderful man who, without early advantages and scientific training, had accomplished so much. I had studied a dozen languages, delved in literature and art, and had spent my best years in libraries reading all sorts of stuff that fell into my hands, from Newton's *"Principia"* to the novels of Paul de Kock, and felt that most of my life had been squandered. But it did not take long before I recognized that it was the best thing I could have done. Within a few weeks I had won Edison's confidence and it came about in this way.



The S. S. *Oregon*, the fastest passenger steamer at that time, had both of its lighting machines disabled and its sailing was delayed. As the superstructure had been built after their installation it was impossible to remove them from the hold. The predicament was a serious one and Edison was much annoyed. In the evening I took the necessary instruments with me and went aboard the vessel where I stayed for the night. The dynamos were in bad condition, having several short-circuits and breaks, but with the assistance of the crew I succeeded in putting them in good shape. At five o'clock in the morning, when passing along Fifth Avenue on my way to the shop, I met Edison with Batchellor and a few others as they were returning home to retire. "Here is our Parisian running around at night," he said. When I told him that I was coming from the *Oregon* and had repaired both machines, he looked at me in silence and walked away without another word. But when he had gone some distance I heard him remark: "Batchellor, this is a d—n good man," and from that time on I had full freedom in directing the work. For nearly a year my regular hours were from 10.30 A. M. until 5 o'clock the next

MY NEW BOOK
"Muscular Development"
will tell you how to get a wonderful muscular development like mine, perfect health, abundance of vitality and great strength as I have.

EARLE E. LIEDERMAN

www.americanradiohistory.com

morning without a day's exception. Edison said to me: "I have had many hard-working assistants but you take the cake." During this period I designed twenty-four different types of standard machines with short cores and of uniform pattern which replaced the old ones. The Manager had promised me fifty thousand dollars on the completion of this task but it turned out to be a practical joke. This gave me a painful shock and I resigned my position.

Immediately thereafter some people approached me with the proposal of forming an arc light company under my name, to which I agreed. Here finally was an opportunity to develop the motor, but when I broached the subject to my new associates they said: "No, we want the arc lamp. We don't care for this alternating current of yours." In 1886 my system of arc lighting was perfected and adopted for factory and municipal lighting, and I was free, but with no other possession than a beautifully engraved certificate of stock of hypothetical value. Then followed a period of struggle in the new medium for which I was not fitted, but the reward came in the end and in April, 1887, the Tesla Electric Company was organized, providing a laboratory and facilities. The motors I built there were exactly as I had imagined them. I made no attempt to improve the design, but merely reproduced the pictures as they appeared to my vision and the operation was always as I expected.

In the early part of 1888 an arrangement was made with the Westinghouse Company for the manufacture of the motors on a large scale. But great difficulties had still to be overcome. My system was based on the use of low frequency currents and the Westinghouse experts had adopted 133 cycles with the object of securing advantages in the transformation. They did not want to depart from their standard forms of apparatus and my efforts had to be concentrated upon adapting the motor to these conditions. Another necessity was to produce a motor capable of running efficiently at this frequency on two wires which was not easy of accomplishment.

At the close of 1889, however, my services in Pittsburg being no longer essential, I returned to New York and resumed experimental work in a laboratory on Grand Street, where I began immediately the design of high frequency machines. The problems of construction in this unexplored field were novel and quite peculiar and I encountered many difficulties. I rejected the inductor type, fearing that it might not yield perfect sine waves which were so important to resonant action. Had it not been for this I could have saved myself a great deal of labor. Another discouraging feature of the high frequency alternator seemed to be the inconstancy of speed which threatened to impose serious limitations to its use. I had already noted in my demonstrations before the American Institution of Electrical Engineers that several times the tune was lost, necessitating readjustment, and did not yet foresee, what I discovered long afterwards, a means of operating a machine of this kind at a speed constant to such a degree as not to vary more than a small fraction of one revolution between the extremes of load.

The Invention of the Tesla Coil

From many other considerations it appeared desirable to invent a simpler device for the production of electric oscillations. In 1856 Lord Kelvin had exposed the theory of the condenser discharge, but no practical application of that important knowledge was made. I saw the possibilities and undertook the development of induction apparatus on this principle. My progress was so rapid as to enable me to exhibit at my lecture in 1891 a coil giving sparks of *five inches*. On that occasion I frankly told the

(*Continued on page* 89)

Don't Commit A Crime Against The Woman You Love

LIONEL STRONGFORT

"Dr. Sargent of Harvard, declared that Strongfort is unquestionably the finest specimen of physical development ever seen."

NO AMOUNT of love will ever atone for the crime you will commit, if you make some pure, trusting young girl your wife when you are UNFIT to assume the duties and responsibilities of a husband and a father. Her whole future life, her body and soul, will be in YOUR keeping; no one will be able to help her if YOU prove faithless to her trust in you. *Don't put the matter aside*, you can't get away from it; you can't make any girl happy, if you are weak, impotent, sickly; grouchy with dyspepsia or biliousness, poisoned by constipation, or suffering from any other debilitating ailment. Stop and think, right now, for HER sake, if not for your own. What CAN her marriage to you bring her, but lifelong regret and sorrow, if you are only an apology for a man, with your muscles flabby, your blood like water and your brain woozy as a result of your condition.

She Thinks You Are a Man

She trusts, admires and loves what she THINKS you are—a real MAN, mentally, morally and physically, whom she can *respect* as well as love. She believes you to be a man who can look any other man in the eye and hold your own with him; who is able to protect her under any circumstances; who can make his way in the world and give her the comforts she has a right to expect from her husband; and finally who will ultimately make her the mother of healthy, happy children, a blessing to you both. Think of the kind of children you will make her the mother of if you are one of the great UNFIT! Think of the weak, ailing, rickety, defective boys and girls such men bring into the world—pitiable little creatures, with no chance in life, living reproaches to the father who begot them. Don't close your eyes to these things. They are *facts;* facts thoroughly understood by every breeder of dogs, cattle and horses; facts recognized by the legislators of several states, who would make it a LEGAL, as well as a MORAL, crime to marry when unfit.

Make Yourself 100 Per Cent Fit

Put your past behind you. What if you have led a gay life and sowed a big crop of wild oats? Start NOW to root them out. What if you have burned the candle at both ends, and feel now like a human wreck, with your strength of body and mind dissipated and your vitality ebbing away? All the more reason why you should begin *now, TODAY*, to stop that steady loss, build up your strength again, regain your lost vitality and make a manly, red-blooded man of yourself. It's the ONLY thing to do—the only way to have any more happiness in life—the only way to keep from slipping down into the scrap heap of the hopelessly down-and-out—*and you can do it, if you go about it the right way.*

Strongfort Will Show You How

No matter what your work or business or occupation, you can build yourself up in my way without interfering with it in the least. I'll help you strengthen your heart, lungs, stomach and every other vital organ; I'll help you free yourself from dyspepsia, biliousness, constipation, catarrh or other chronic ailments; I'll help you steady your nerves and clear your brain and send the rich, red blood of life and vital energy coursing through your arteries again, so that you will be THE man your wife believes and expects you to be. I haven't any patented dope or bottled physic to sell you. I haven't any iron-bound, muscle-fatiguing, tiresome routine of exercises or straitlaced, ascetic living to recommend. I am a Builder Up of Men, and I build them up in Nature's way—the way that was successful in making me the strongest man in the world; the way that is succeeding with my pupils, thousands of them, in every country of the civilized world.

Don't Be Discouraged

Never mind how low down you have fallen; I don't care a rap what your present condition is or what brought you to it—*I know I can improve you* 100 per cent in a few short months. I am doing it every day for men who had given up all hope; bringing back their health and strength; making them respected members of society again; filling them with life, and ambition, pep and ginger, and enabling them to make a success in the world. I can do for you what I have done and am doing for others, and I WILL DO IT, if you will mark NOW, on the coupon below the trouble or troubles that are affecting you, or the points you are most interested in, and MAIL IT TO ME TODAY. My free book, "Promotion and Conservation of Health, Strength and Mental Energy," will show you the quick, easy, sensible, *manly* way out of your difficulties; the way that has brought renewed hope and confidence and joy of living to thousands of other men; it will show you how to make yourself FIT to live; FIT to marry; or, if you are married already, it will help you become the father of healthy, happy, laughing children who will be a joy to you and your wife as long as you live. YOU WANT THAT BOOK.

Do Your Part Now

Do YOUR part, and I'll do MINE—I guarantee it. Fill out and send me the coupon, with three 2c stamps for postage and packing on the free book, "Promotion and Conservation of Health, Strength and Mental Energy," and I'll send you with it, without charge, helpful, *personal* information on the conditions that are troubling you. DON'T DELAY—here's the coupon—Do your part NOW

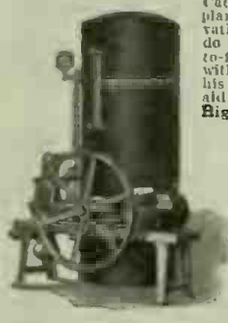
DO Your Own PLUMBING AND HEATING at low cost



Send for our big instructive 256 page well-bound Handy-Man Book Catalog. Every Home Owner, Contractor, Electrician, Farmer, Factory Manager, etc., needs it. Shows over 10,000 Fixtures and Supplies in plumbing and heating at wholesale. Shows how to save skilled labor, hard work and unnecessary material by

OUR NEW

Cut-to-fit-Method

This wonderful book helps you select and install the proper Plumbing, Water Supply System, Hot Air, Water or Steam Plant. Besides being our Wholesale Catalog it has many practical plans, diagrams, sketches, elevations, etc., showing how to do the work this newer, cut-to-fit way. Any handy man with a few tools can easily do his own installing with the aid of this

Big Handy-Man Book

We have spared no effort and have gone to a great expense to compile this valuable book. With economy still a national necessity, it would be unpatriotic to send this extensive book broadcast to non-interested parties. Therefore, we request a temporary deposit for each copy of 25c which we refund on first order, or we send our Bargain Bulletin Free. Address Today

HARDIN-LAVIN COMPANY
40 Years At
4510-20 Cottage Grove Ave., Chicago
$500,000 plants behind our guarantee

THIS is Richard A. Oldham. He earned $2200.00 in four months with a Haywood Tire Repairing outfit. For 20 years he was telegraph operator on the Illinois Central Railway. He is now 58 years old. He answered my advertisement—quit his job—bought a plant and opened a business. He just wrote me "I have made more in eight months than 2½ years as operator." There are now 500 stations where tire repairing is neglected.

I Must Have 500 Men

To Fill These Positions

I have a Big interesting Book to send you. It tells all about tires—gives inside figures and profit. Send for it! What Oldham and others are doing You can do. $2500.00 to $4,000.00 per year is conservative. Like Mr. Oldham—One machine will start you. Then open a shop. You can see business all around you. Put out a Haywood Sign and business will come to you. Now get started. Send for the Big Book and start making money.

M. HAYWOOD, Pres.

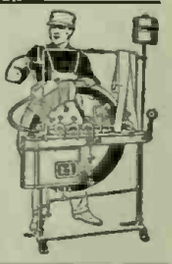
DETROIT SCHOOL OF LETTERING
Established 1899. 685 D. S. of L. Bldg., DETROIT, MICH.

FUTURE RAPID TRANSIT

(*Continued from page 7*)

an airplane and provided with planes or wings. This provision of planes on either side of the car renders it possible to modify their angle of incidence, to relieve the supporting rail of a larger part of the weight of the vehicle.

The aërial monoflier, as our artist has here depicted, may be propelled by means of one or more propellers placed either at one end of the car or at both ends, and in any case these could be electrically driven, the current necessary for operating the electric motors being taken thru appropriate contact shoes or brushes, resting in contact with insulated conducting rails fixt to the frame-work upon which the monorail is supported. The end view of the monoflier shows clearly the arrangement of the two third rails, one on either side of the monorail, constructed so that they may also serve to insure the maintenance of the car in the proper vertical position, by preventing any lateral displacement thereof. For the purpose of maintaining the car in the proper vertical position by virtue of the third rails just mentioned, there are provided two series of wheels inside the car, as the end view indicates, one set on either side of the monorail structure. From one end of the car to the other, the slot, as it might be called, slightly expands so that the car can negotiate curved sections of rails, which it could not do if the slot running thru the car from front to rear were made perfectly straight. The car is provided with electric lights and the usual protective features, such as electric braking means, electric fans in warm weather, signal lights, etc. The motorman, whose cab is placed in the forward part of the car, has full control of the electric propeller motors, and he can also change the angle of the planes, on either side of the monoflier, so as to cause it to practically float in the air when it is under full headway, the monorail passing thru its center merely acting as a guide rail along which it flies. Electric heaters could be used in the cold weather, and for heating coffee and cooking light meals, etc., in the buffet lunch on board, electric stoves would be available.



In general the monoflier is ovoid in form, thus following the latest practise in the design of dirigible airships, so that it will encounter the minimum of resistance from the air during its displacement. Such a craft should be easily able to attain a speed of 175 to 200 miles an hour and higher, as when it has attained its highest velocity and the planes are properly elevated, the craft will be practically *floating in the air*, without encountering any retarding friction from engagement with the monorail, excepting when passing around curves. Even here the friction which would normally be encountered might be reduced considerably if not entirely obviated by the provision of a proper air rudder at the rear of the car. When the car had reached the end of its run, owing to its peculiar ovoid shape, etc., it would have to be reversed in position before starting back, or else sent back to its destination by a parallel monorail system, which would undoubtedly be the usual practise, much in the manner shown in the accompanying view. Undoubtedly in the years to come, when such highly congested localities as New York City have become more and more built up with towering office structures, with a daily working population of say 12,000,000 to 15,000,000 people, and the subways and street elevated lines have become crowded to the limit of endurance, then it seems that such a system as this should serve a very useful purpose indeed.

If such a system as here illustrated were properly constructed and designed, it would not only serve as a fine piece of industrial engineering, but it would also give

AN EASY WAY TO MAKE MONEY Don't be content to plod along on a small salary. Be independent. Go in the tire repairing business. One man says "I made $60.00 the first day." Others average $200 to $500 a month. Very little capital needed. Jobs plentiful. Every motorist a possible customer. No experience needed. We teach you.

SHALER Tire Repair Outfit

Improved Wrapped Treed Method
Used by Tire Manufacturers

Does as good work as the big high priced vulcanizing outfits. A boy can use it. It's the only vulcanizer that has Automatic Heat Control, and can't undercure or overcure a tire. Requires no watching or regulating.

www.americanradiohistory.com

high speed traveling facilities for suburbanites, who have to travel ten to twelve miles every night and morning to and from business, such as those who live in the rapidly developing Westchester County section, where undoubtedly many hundred thousand of New York's future populance will reside, as well as those who will make their homes on Long Island.

As the illustration shows, the monoflier is divided into several floors, and if desired, each floor may be subdivided into compartments. The lower floor is preferably reserved for luggage, freight and mail, while the upper floor may be very well utilized for the electric motors operating the propellers and lifting planes. Stairways lead from the lower floors to the upper floor or floors, depending upon the size of the car. The main frame-work of the car is composed of rolled steel sections, and the rest of the structure including the floors and outer covering is of aluminum, the seams being electrically welded so as to present a perfectly smooth surface on the entire exterior in order to minimize the resistance to the air. The windows, which afford an excellent view to the passengers as they skim along over the tops of the skyscrapers far above the city and the surrounding country, are fitted with the new unbreakable glass. Also the outer contour of the windows and doors are made so as to fit very tightly and to preserve an even surface both vertically and horizontally for the purposes aforementioned.

Some other novel features involved in the design of this aërial monoflier, which seem to possess great practicability are as follows: The inventor points out that in order to impart greater stability to the car, its longitudinal axis should preferably be located below the top of the monorail. In other words, the greater part of the weight should be distributed on a line below the monorail level, which line is at a point about one-third the height of the car from the top of the same. The large wheels in the interior slot of the car, which rest on the upper or monorail, are heavily flanged. In order to provide against the possibility of the vehicle leaving the track vertically under the influence of the air pressure beneath its wings, the lower portion of the third rail rollers may be given a circular flange, which in the case under consideration would bear against the lower flange of these rails, and thus serve to maintain the car in contact with the rails. The car could be made longer as desired, but, of course, it could not be made too long, or otherwise it would be impossible to turn curves, unless they had very long radii.

Most probably the reader has become interested in the general working principles of such an aërial monoflier system, particularly in the probable arrangement of the stations, which could be of several types, as our illustration herewith shows. Some of the stations could be erected on the roofs of tall buildings where these were of appropriate height for the purpose, and in some cases where the railway past directly thru the tower of the skyscraper, the station could be built in the "hole in the wall", as it might be called. Each station could be designed in several ways—for instance, it might in some cases be provided with one platform, and the passengers on the monoflier in this case would have to descend from the upper to the lower floors by means of the stairways provided in the car, before reaching the station. The station platforms could be enclosed and provided with sliding doors, so as to be draft-proof in the cold weather, and high speed express elevators would carry the passengers from the aërial railway station to the street, or by taking a local elevator, they could alight on any floor of the building—all of which seems very good from a strictly engineer point of view.

Different Metals Require Different Hack Saw Blades

If you want to cut structural steel or brass pipe efficiently, you need a different hack saw than for cast iron or machine steel, and you certainly can't work as coarse a blade in a light machine as in a heavy one. To try to do everything with the same blade is simply to do most of it inefficiently.

Starrett Hack Saws

do the most work with the least effort and in the shortest time because each one is made to meet the exact requirements of different metals in different powered machines.

Our Hack Saw Chart will help you select the proper blade for any kind of work, and you can depend upon it. Our Service Department will help you solve your cutting problems and increase the efficiency of your cutting-off department.

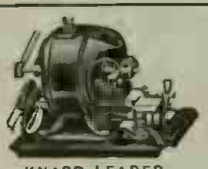
Learn Telegraphy-Wireless

Right In Your Own Home, in your spare time

Remarkable opportunities are offered experienced wireless operators and telegraphers. The demand is greater than the supply—steady positions at increased pay and rapid advancement are assured.

DEPENDABLE KNAPP ELECTRIC SPECIALTIES

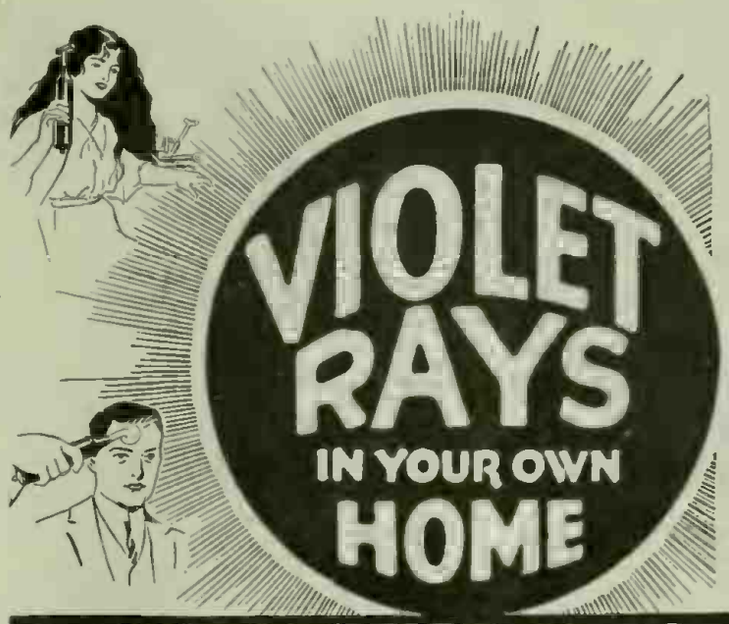


Combination Wireless-Telegraphy Outfit

will soon make you an accomplished operator. Teaches Light and Sound Signals, both Radio and Morse. Outfit consists of exceptionally fine Telegraph Key, Buzzer, 3 Binding Posts, Lamp, Lamp Socket and Control Switch—all mounted on a highly finished base. Two outfits can be operated at considerable distance apart for sending and receiving practice.

$3.00

This Same Outfit Without Lamp $2.50



KNAPP LEADER
Radiates real power-plant efficiency. Two Speeds and Reverse.
Price, Complete, $3.50

Order to-day. Or your dealer can secure it for you. Descriptive circular and catalog of celebrated Knapp Motors and Electrical Specialties from 10c up mailed free on request.

TRY THE VIOLETTA FREE

NOW in your own home you can have wonderful Violet-Ray treatments exactly as are given by eminent physicians and beauty specialists throughout the country. Now you can rid yourself of headaches, catarrh, constipation, eczema, insomnia, lumbago, nervousness. Relieve your pain from neuritis, rheumatism, and other disturbances. Multiply your bodily health, vitalize your nerves, double or treble your energy by using Violet-Rays. Sleep better, increase your strength, and improve your appetite and digestion. Soothe your nerves, reduce or increase your flesh. Tone and strengthen the entire system. Beautify your complexion. All with Violet Rays!

Not a Vibrator

The Violetta is not a Vibrator. It is not a machine that contracts the muscles—it does not shock, it does not pound the muscles—it is absolutely painless. Violet-Rays administered by the Violetta are wonderful even for infants. Relieve pain and suffering in every part of the body. Simple tests prove that Violet-Rays pass completely through every part of the body, stimulating every cell and organ. It is electricity in its highest remedial form.

Read What Physicians and Users Say

Trixie Friganza, well known actress says "Cheerfully will I add my praise for Violetta. It's the best 'pain chaser' and 'soother' I've had the good fortune to find. It's WONDERFUL. It cured my brother of neuritis. As for myself I use it for facial treatments and general massage, I cannot say too much for it."

Dr. Bert H. Rice, of Vinton, Iowa, says: "I have good results with the Violetta High Frequency Instrument in all cases of neuralgia. Almost instant relief in Facial Neuralgia."

K. L. Allen, D. C., 205 Boone National Building, Boone, Iowa, says: I have had very good results with the application of High Frequency Current in cases of Paralysis, Rheumatism and Neuritis and think it a great help in drugless healing."

Dr. Daniels, Lisbon, North Dakota, says: "Have used the VIOLETTA in such cases as Goitre, Bronchitis, Pleurisy, Neuritis, Neuralgia, and Lumbago, and find it very beneficial. In fact, I would not be without it in my office."

Frank Borzone, Seattle, Wash., says: "I purchased the VIOLETTA for my wife who was suffering from an acute attack of Sciatica. From the very first treatment it induced peaceful rest and she is entirely well now."

LOCATING ENEMY GUNS BY FLASH AND SOUND

(*Continued from page* 14)

As the name suggests, "sound ranging" is based for its operation on the transmission of sound, either thru the air or thru the earth, whenever a gun is fired. Some of this work is performed in conjunction with the flash spotters, for by observing the flash of a distant gun, and then counting the seconds on a split-second watch until the sound is heard, the distance at which the gun is located may be accurately computed, as the velocity of sound thru air is about 1,100 feet a second. The velocity of light is practically instantaneous, or 186,000 miles per second, and secondly it serves very accurately to consider the flash of the gun as the starting point of the onward journey of the sound wave. The accurate locating of any gun is accomplished by having two observers take telescopic or other sightings on the gun, and noting the distance between the two observers and the angles as measured on their respective instruments. Thus it is a simple matter to solve accurately by triangulation the definite location of the enemy cannon.

This is only one side of "sound ranging" science, however, as applied to modern artillery tactics, and the scientists and engineers connected with the work of the artillery, particularly the locating of enemy gun positions, early in the war worked out a highly sensitive sound detecting apparatus which picked up the sound of enemy guns, even at a great distance, as transmitted thru the earth. For this purpose detectaphones and Audion amplifiers prove highly efficacious. Enemy guns 15 miles distant were accurately located by this means, the same triangulation maneuvers as previously outlined being followed. Two and usually three observation (sound-detecting) points being employed, advantage being taken of the values as given by the velocity of sound when transmitted thru the earth, and also by the difference of time at which these sounds arrive at different sound-detecting stations. Used in conjunction with the regular angular measurements, the locating of enemy guns became as simple to General Pershing's artillerymen as weighing out a pound of butter would be to a groceryman.

EXPERIMENTS IN RADIO-ACTIVITY.

Part III.

(*Continued from page* 35)

radio-activity noticed that radium induced an activity into substances placed in its vicinity. This induced activity was found to consist of an active deposit formed by the disintegrating radium. In the spinthariscope the lens portion was found to assume this induced activity because of its proximity to the active substance. This may be easily shown by use of the electroscope, described in the first article. Using the spinthariscope in the possession of the author, the following results were obtained:—empty, the electroscope discharged in 700 seconds; the lens portion was then removed and introduced into the electroscope. This time it only required 320 seconds. This conclusively shows that radium induces an activity into other objects exposed to its radiations. This induced activity, however, soon decays. Other uses for the spinthariscope will suggest themselves to the reader, but in any case he will certainly never regret purchasing or else making one.

Radiograph Taken by the Author, Using An E. I. Co. Spinthariscope with Lens Removed. The Figure "U" Was Cut from Brass Sheet.

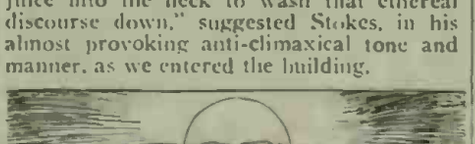
SCIENCE IN SLANG
THE SPECKS IN SPACE

(Continued from page 45)

last is one octillion, five hundred seventy-five septillion. The weight of the Sun is two octillion."

"Then the Sun weighs twenty-three decillion, forty nonillion grains," put in Punk.

"Approximately," returned Stokes, with his quaint smile.



"Do you think that the lines of—er, force, or electricity, that are radiated from the Sun act upon the Earth turning on its diurnal axis and traveling in its course around the Sun in the same manner as the armature of a dynamo?" enquired Bill Dean.

"That is possible, I suppose. At least the radiations from the Sun are, more than likely, responsible for our electrical phenomena and along with it—but we do not know to what extent tho—plant and animal life.

"Some have one theory, some have another, but I would not be surprised at some new stuff that will do to our dope what Galileo did to the old 'Seven Stars' idea. From the thought that our planet was the center (natural to the more or less egotistical Man) of the universe, to the idea that the Sun was IT and then that the Pleiades are the center. Some say they are—we cannot disprove it, as far as I know of the matter. But that is not saying it is final. At present we have no way of peering way out into the infinite space and discerning the outer stellar orbs. With the innovation of the instrument that makes it possible, we will step on a stride further as Galileo did with his telescope, and discover other systems and the orbs that go to make up the system. The more, I believe, we go into the study of the universe and its gloriousness the more aware will we be of its true greatness and vastness.

"Now, as we have inches and feet as linear measurements, we have the distance between the Sun and Earth as the 'Astronomical Unit'—then, when ascertaining the distance of a star way out there in the vast infinite depths that we cannot reach or understand by figures nor even imagination, but can only term Space, by determining its parallax, we are only able to express its distance in 'Light Years'—and when you stop to consider that light travels at the rate of 186,000 miles per second—well buy a tablet and figure it for yourself. To our minds, we cannot conceive of anything without beginning nor end (excluding the circle), and to our minds things must have three dimensions to be understood by us. Now the universe has apparently no beginning nor end as far as we are able to discern.

At this point we drew up at a road house, or Inn. "How about a shot of raspberry juice into the neck to wash that ethereal discourse down," suggested Stokes, in his almost provoking anti-climaxical tone and manner, as we entered the building.

AN OMISSION

We wish to state that credit for the photographs accompanying the article entitled "The City of Splendid Night," by Amos Stote, publisht in the January, 1919, issue, should have been given to the New York Edison Co.

Supplied with current from the light socket, a two-fan electric ventilator has been invented which, when set in a window, draws in fresh air and expels that already in a room.

"I Can Succeed!"

"What other men have done with the help of the International Correspondence Schools, I can do. If the I. C. S. have raised the salaries of other men, they can raise mine. If they have helped others to advance, they can help me. To me, I. C. S. means 'I CAN SUCCEED.'"

Make up your mind right now that not another day shall pass until you have made *your* start toward success.

For 27 years men in offices, stores, shops, factories, mines, railroads, and in the Army and Navy have been winning promotion and increased salaries through the I. C. S. More than 100,000 men and women are getting ready *right now* with I. C. S. help for the bigger jobs ahead.

No matter where you live, the I. C. S. will come to you. No matter what your handicaps, or how small your means, we have a plan to meet your circumstances. No matter what career you may choose, some one of the 280 I. C. S. Courses will surely suit your needs.

When everything has been made easy for you—when one hour a day spent with the I. C. S. in the quiet of your own home will bring you a bigger income, more comforts, more pleasures, all that success means—can you let another single priceless hour of spare time go to waste? Make your start right now! This is all we ask: Without cost, without obligating yourself in any way, put it up to us to prove how we can help you. Just mark and mail this coupon.

Some Government War Secrets

—and the reason for the Victory Liberty Loan

"WE HAD promised the Allied war-chiefs that we would have in France by July of last year, 600,000 men. On that date we had a little over 1,900,000. We had behind them nearly 2,000,000 in this country under training who would have been on the front before July, 1919, and we had behind those 4,000,000 men as many more men as were necessary to do the job.

"Four million men in France meant at least 20,000,000 tons dead weight of shipping to take care of them, and we had that program under way and were making our maximum output just about the time the armistice was signed. Twenty million tons of shipping at present cost means just about $4,000,000,000 or a little over.

"Did you know that those 2,000,000 men in France, who did so much to bring the war to an end, had only one small battery of American-made artillery behind them; just one battery of 4.7 and a few big naval rifles! The rest of the artillery used by the American soldiers was made by Frenchmen in France. But, on the way was a great stream of guns and shells that would have blown the German army off the earth. But that stuff had just come into large production in November, 1918. And it is for the deliveries on that big peak production that we have to pay in December and January and will have to continue to pay for in February."

* * *

"Our program for tanks, of which few got into action, was, I have been told, to provide for a tank in 1919 for every 75 feet of the front."

* * *

"Those are some of the things that cost money, and practically none of those great supplies of artillery, of shells or tanks, even of ships, practically none of that stuff was ever used. What an awful waste! We are asked to pay for a dead horse that never drew a load! It is discouraging, paying for something that is no good!

"Well, let's see if it's any good. Do you realize that the German army was never really routed; that except for a little bit of a stretch down in Alsace-Lorraine it was never fighting on German soil? They were brave soldiers, the German soldiers. They still had millions of them on the Western front. And yet they surrendered while they were on foreign soil. They had a fleet which had required years and years and years to build and it flew the white flag without firing a shot."

* * *

"I cannot believe that these great stores of munitions were wasted. In addition to the bravery of the American doughboy that arrived in France and got into action in numbers about the 15th of July and turned the tide and drove the Germans back, in addition to his bravery and his almost reckless spirit of determination, for which the praise cannot be too high, I say in addition to that, I believe there was one other factor that brought this war to an end at least one year before the most optimistic of us had dared to hope for. One other factor, and that was that Germany, her general staff, knew that back of the few hundred thousand Americans that really got into big action, and back of the 2,000,000 in France, was another 2,000,000 ready; and despite the fact that we had practically no artillery of American make on the Western front, that there was a great stream of American-made artillery on the way. And it is my conviction that the German staff knew that if they prolonged the war into 1919, they were inviting, not certain defeat, but certain annihilation."

* * *

"*We are asked to pay for things that were never used;* we are asked to pay for shells that never were fired; for cannon that never reached the battlefront, but we are asked to pay for those things that helped in a major way to bring this war to an end in 1918 instead of 1919. And the bringing of this war to an end twelve months before we could logically look for it means that *we are asked to pay for saving the lives of 100,000 or 200,000 American boys who would have died on foreign soil had the war continued another year.*"

—Extracts from a speech by Hon. Lewis B. Franklin, Director War Loan Organization, U. S. Treasury Department.

LIBERTY V LOAN

Victory Liberty Loan

The "Clean-up" Button

Space contributed by

ELECTRICAL EXPERIMENTER
SCIENCE & INVENTION

Prepared by American Association of Advertising Agencies cooperating with United States Treasury Department

www.americanradiohistory.com

Edited by H. GERNSBACK

In this Department we publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Regular inquiries address to "Patent Advice" cannot be answered by mail free of charge. Such inquiries are publisht here for the benefit of all readers. If the idea is thought to be of importance, we make it a rule not to divulge all details, in order to protect the inventor as far as it is possible to do so.

Should advice be desired by mail a nominal charge of $1.00 is made for each question. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

NOTICE TO CORRESPONDENTS

Questions on Patent Advice are answered in this department every month, and naturally each question must take its turn. We have received so many letters during the past months that it is absolutely impossible for us to answer them all in the "Experimenter." Thus, for instance, the answers appearing in this issue are of letters going back as far as Oct., 1918. We would therefore urge our correspondents to bear this in mind, and if an answer is wanted quickly, correspondents should make themselves acquainted with the rules printed above.

Sectional Automobile Radiator

(318) Edwin Schade, Camden, N. J., writes: "I have noted in a recent magazine a photograph of a pile of automobile radiators that have been damaged in the war. It has been my experience in repairing the present type of radiator that it takes anywhere from one-half hour to as high as three days to fix a leak. This is true especially when it happens to be in the interior. My idea is to build a radiator in units. Should one or more units be damaged, they could be replaced by others in a very short time. Kindly advise if such an idea would be of any benefit, and if it could be patented.

A. It is doubtful that a device of this kind would prove satisfactory, for the reason that there would probably be a good deal of trouble to interconnect the various sections, and there would probably be just as much trouble in keeping these connections from leaking as in a well-made radiator. That a device of this kind can be patented is also very doubtful to us.

Telephone Appliance

(319) R. C. Kennan, Indianapolis, Ind., submits a drawing and description of a telephone appliance which is designed primarily to eliminate trouble for the man who talks several feet away from the phone and expects people to hear him on the other end of the line. The arrangement also permits using the phone without holding the receiver in the hand. Our correspondent wishes our advice if this device is patentable and if we think a market exists for such a device.

A. This is one of those devices of which probably five thousand have been patented in various forms in the past. Our correspondent's device has a lever at the end of which the receiver is fastened. The arm and the receiver swing in a half circle, and is then locked. The subscriber can then talk without using his hands. The hook connection is automatically established as soon as the lever is raised.

A There is nothing new to this and, as we stated, many thousand similar ones have been patented in the past. There does not seem, moreover, to be a market for such an appliance.

Trolley

(320) Frederick E. Barber, Syracuse, N. Y., encloses a sketch and description of a device to keep the pole of a trolley from jumping off the wire. Our advice is asked.

A. We have exprest our views as to trolleys a great many times in these columns. Our advice to trolley inventors is: "don't". Our ideas were fully exprest in a recent answer to one of our correspondents in these columns. We refer to our March issue, page 825, Patent Advice No. 308

Magazine Mailer

(321) Carlyle Rudolph, Minneapolis, Minn., says: "Is there such a thing as a magazine mailer? A machine that folds, wraps, stamps and gets magazines all ready for mailing. I have an idea which I think is worth something, but don't like to start on it until I know if there is anything similar in use."

A. There are certainly machines to do this. For instance, the ELECTRICAL EXPERIMENTER is folded and wrapt every month on a machine of this kind. While the machine does not automatically stamp the wrappers, this, however, can readily be accomplisht by a simple attachment on the market now. If our correspondent has something fundamentally new, he is advised to get in touch with any of the large printing houses who have such machines and he can hear from them as to what the requirements are.

Safety Elevator Device

(322) Ralph E. Hast, Elkins, W. Va., explains his invention as follows: "The idea of this invention is to have a device on elevator doors which, when the doors were closed, would close a circuit, allowing the operator to ascend or descend, but when the doors are *not* closed the circuit would be open, thus rendering it impossible to operate the elevator. The device on the doors would be a partly concealed socket which operates easily but forms a constant circuit when closed and cannot be jarred out of place."

A There is nothing new in our correspondent's idea. Safety devices of this kind have been used for many years, and are in use right now. Take for instance the New York Subway Elevators, particularly the ones at 181st Street and Broadway, operate with this device.

Depth Bomb

(323) George W. Curtis, Detroit, Mich, has invented a depth bomb which works on the sea water-conductivity plan by means of which contacts are closed when the sea water enters the intake of the bomb. Our advice is asked as to the practicability of this device.

A. There is nothing new about this device—many bombs of this kind having been proposed during the war. The regular depth bombs, however, working on the hydro-static principle, are very much simpler and better.

U.S. PATENTS

Don't Lose Your Rights

Before disclosing your invention to any one send for blank form "Evidence of Conception" to be signed and witnessed. A sample form together with printed instructions will show you just how to work up your evidence and establish your rights before filing application for patent. As registered patent attorneys we represent hundreds of inventors all over the U. S. and Canada in the advancement of inventions. Our schedule of fees will be found reasonable. The form "Evidence of Conception" sample, instructions relating to obtaining of patent and schedule of fees sent upon request. Ask for them,—a post card will do.

PATENTS

TO THE MAN WITH AN IDEA

I offer a comprehensive, experienced, efficient service for his prompt, legal protection and the development of his proposition.

Send sketch, or model and description, for advice as to cost, search through prior United States patents, etc. Preliminary advice gladly furnished without charge.

My experience and familiarity with various arts frequently enable me to accurately advise clients as to probable patentability before they go to any expense.

Booklet of valuable information and form for properly disclosing your idea, free on request. Write today.

RICHARD B. OWEN, Patent Lawyer
164 Owen Building, Washington, D. C.
2276-8 Woolworth Bldg., New York City

PATENTS TRADE-MARKS AND COPYRIGHTS

Before disclosing an invention, the inventor should write for our blank form "EVIDENCE OF CONCEPTION." This should be signed and witnessed and if returned to us together with model or sketch and description of the invention we will give our opinion as to its patentable nature.

Our illustrated Guide Book, HOW TO OBTAIN A PATENT, sent Free on request. Contains full instructions regarding Patents, Trade-Marks, Foreign Patents, Our Methods, Terms and 100 Mechanical Movements illustrated and described. Articles on Patent Practice and Procedure, and Law Points for inventors.

An actual search of United States patents made in all cases before preparing application for patent

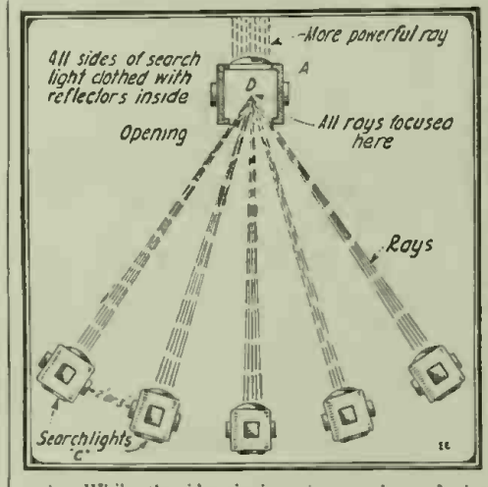
STAMMERER

Send 10 cents for my remarkable book, "How To Stop Stammering." Kill the fear of stammering. Re education the key.
The Hatfield Institute, 109 N. Dearborn St., Chicago, Ill.

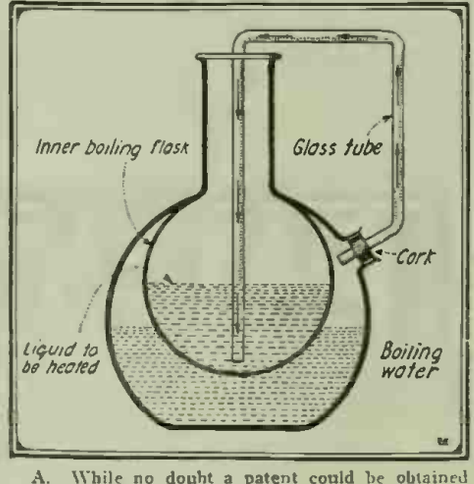


Phonograph Needle

(324) R. W. Napper, B. Guiana, S. America, asks us: "Do you think that a patent of any value could be secured on a double-ended gramaphone needle, i. e., a needle sharpened at both ends? This would tend to save steel, as each needle could be used *twice* instead of only once."

A. We do not think that a needle of this kind would be of great benefit and we believe a needle of this kind was once tried. The reason is that a needle of this sort cannot be held as securely as one with the squared off end; it tends to rattle because the upper end is not supported except by a sharp point.

Searchlight



(325) Joel Silver, Newark, N. J., submits the following idea: "I think that if about five searchlights have their rays focused on the inside of another larger searchlight (see illustration) there will be more power; hence a small searchlight, with the aid of others, can be made more powerful. The rear of the main light (A) is cut open (B). All the searchlights (C) have their rays focused upon the center (D) of A. With very good reflectors and a very powerful lens, I am quite sure that a longer distance will be obtained. That is, it will be five times as powerful as one of its size."

A. While the idea is ingenious and no doubt novel, it certainly is not practical, for nothing could be gained either electrically or economically to arrange the searchlights as shown. The reason is that one searchlight can be made to give the same amount of light by using large enough carbons and consuming a corresponding amount of current. Of course, a multiplicity of searchlights are used in a great many cases, but not to concentrate the light on a point. They are usually employed to throw the light over an extended surface.

Chemical Flask

(326) Eug. Lavigne, Montreal, Can., submits diagram and sketch of a combined water bath and boiling flask. It is shown in our illustration. He wishes to know if this idea is patentable and if it is practicable.

A. While no doubt a patent could be obtained on this device, we do not think it would be of much value for the reason that it could be used only in very few cases. As our illustration shows, the evaporating water would flow into the central flask and it is quite certain that more or less water would find its way into the central flask, where surely it is not wanted or needed. This is our main objection to the idea.

COLD LIGHT

(*Continued from page 23*)

proper conditions the small light wave may be given off by the electron without affecting the whole molecule in the least. *That is cold light.*

An interesting experiment can be performed with a vacuum tube, which illustrates completely the principle of light production by ionization, and at the same time explains the principle of the Moore light. Few people, other than scientists, realize what a peculiar thing the production of light in a vacuum or Geissler tube is. The light is evidently not the product of heat, but depends on the fact that the electric spark breaks the gas molecules up into charged particles or ions. And this phenomena is most noticeable when a certain degree of exhaustion is reached in the tube.

When air is pumped out of a tube in which there is an electric spark discharge, several different stages, as shown in Fig. 3, are successively reached. At first the discharge in the tube is the ordinary disruptive spark. In the next stage it forms a quiet thread of light thru the tube. Then the thread of light becomes a broad pencil of light, and finally with more exhaustion the whole tube is filled with a soft luminous glow, which is technically known as the *positive column*. This is the point of highest conductivity of the tube, and may be reached with an ordinary air pump. With further exhaustion, by means of a special air pump, the resistance increases, the cold light disappears, and the point is reached where X-ray phenomena and fluorescence appear. The color of the light in the tube depends on the gas used in the tube and is undoubtedly the product of the ions. Just before the war a Frenchman, Claude, devised a means of producing in quantities the rare gas, *neon*, which gives an intense yellow light in a vacuum tube. The carbon dioxid which Moore uses gives a white light. Other gases, possibly rare ones, may be found which are better still, and *helium* has been suggested as a standard by some. However, up until the time the U. S. Government discovered the way of producing it in immense quantities for balloon work, during the war, it was too rare to be practical. The more the conditions in such a light can be improved, and the more nearly the light is a pure ionization or cold light, the higher the luminous efficiency will be. An interesting table is given, showing the progress which has been made up to the present, including the vacuum tube.

Luminous Efficiency of Various Illuminants

Candle	2 per cent
Gas mantle	5 per cent
Carbon lamp	6 per cent
Flaming arc	15 per cent
Vacuum tube	40 per cent

REVOLUTION COUNTER FOR DYNAMOMETER

(*Continued from page 39*)

duration of thirty seconds. The time element may be changed at will by the use of saws of any desired number of teeth.

To start the apparatus, the starter button is brought into action until both brushes bear on the metal drum. This completes the circuit and engages the clutch thru the electro-magnet and spring thus starting the counter. At every swing of the pendulum, the circuit thru the solenoid is made and broken, thus drawing the saw—as illustrated—thru a circumferential distance equal to one tooth. After thirty swings of the pendulum one brush is again bearing on the insulated section of the drum and the counter clutch is disengaged. A reading of the counter gives accurately the number of revolutions of the dynamometer in thirty seconds. This counter may also be used in connection with a fuel weighing apparatus.

Contributed by W. H. WEBER.

Become an Electrician In One Year Here

Or Learn An Electrical Trade In 6 Months

THIS school teaches electricity thoroughly, from the very fundamentals, including the laws and principles of electricity and the theory of direct current—together with practical lectures and problems, actual training in laboratory work and electrical machine departments of designing, building, repairing, installing, operating, etc. And the faculty here are practical electrical engineers who know how and what to teach because they know what knowledge and ability the great field of Electricity requires.

As one example of this school's thoroughness and practical training and development witness the pictures above showing view of Motor Generator Department, where students actually generate Electricity, making all connections and performing all the necessary operations, on the same practical basis as in a power plant or large industrial concern.

The thoroughness in essentials here, the practical training and able faculty, together with this school's broad facilities and intensive abilities, are the reasons why you can become an Electrician here in one year, or master one of the Electrical Trades in 6 months.

If you are determined to achieve success in the Electrical Field this is your school. You will acquire and accomplish more in a shorter time at a less cost and be a fully developed, practical electrical man when you finish. Mail the coupon at the right and get complete illustrated and descriptive details of the advantages this school affords. If interested in Electrical Engineering with B.S. degree, check same on coupon. Mail the coupon now.

R. O. T. C. UNIT

The War Department of the U. S. Government has recently authorized Junior and Senior Reserve Officers' Training Corps Units in this school. Students in courses listed below are entitled to join Junior Unit if they wish to do so. R. O. T. C. membership offers such advantages as: Complete free uniform equipment, free summer training camp trip, summer uniform outfit and free special technical instruction. Membership and all obligations cancelled on termination of school work.

You Can Earn While You Learn

WE will provide you with part time employment to help defray your expenses here and give you actual outside experience — without interfering with your class hours—which is fully explained in our catalog. Mail the coupon.

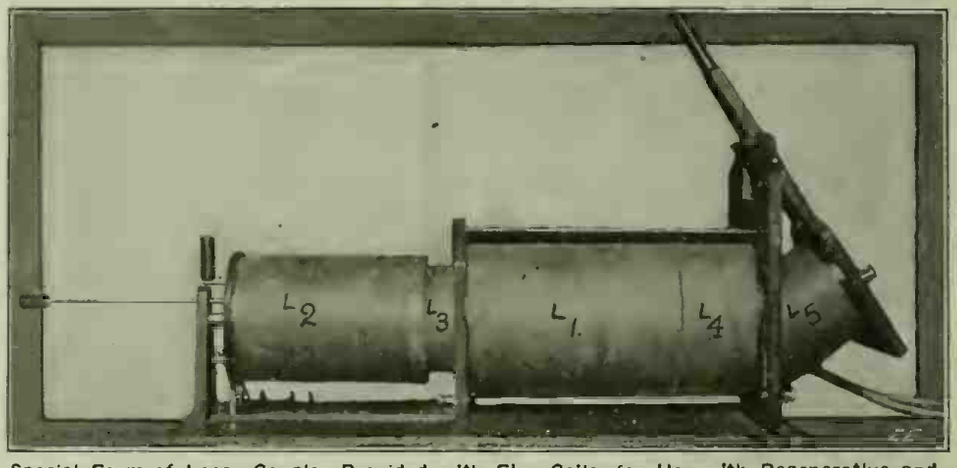
RADIO DEPARTMENT
Continued



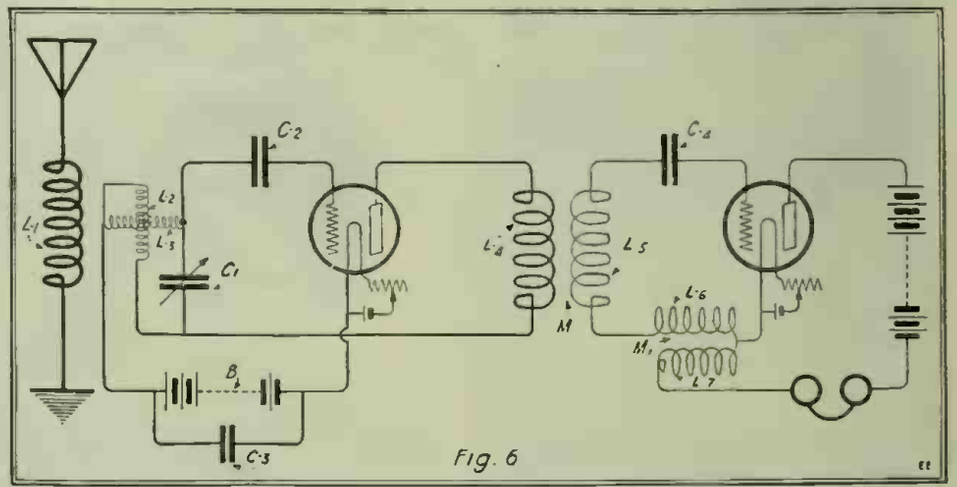
New Regenerative Vacuum Tube Circuits
(*Continued from page 33*)

these wave lengths, the proper size inductances are always to be utilized. It is advisable to use this circuit whenever large amplifications are desired at extremely low wave lengths. Tests have been made with this circuit in comparison with other low wave length regenerative circuits, and it was found that the above circuit gave better and more efficient results and that it was possible to produce regeneration in the plate circuit with much greater ease than that obtainable with the usual type of circuit.

A similar but a more complicated circuit is shown in Fig. 5. The radio frequency bridging condensers C_3 and C_4, are used to permit radio frequency currents to pass freely to the plate.

circuit is to amplify the audio frequency currents of the first vacuum tube. This audio amplification is accomplisht thru coils L_6 and L_7, which are mutually coupled with this arrangement, and it is possible to amplify the signals to 1000 or more times their original value. It was possible, in tests, to amplify signals received from a distance of 5000 miles to such a value as to cause the incoming signals to be heard twenty feet away from the telephone receiver. The telephone receiver was equipt with the proper megaphone.

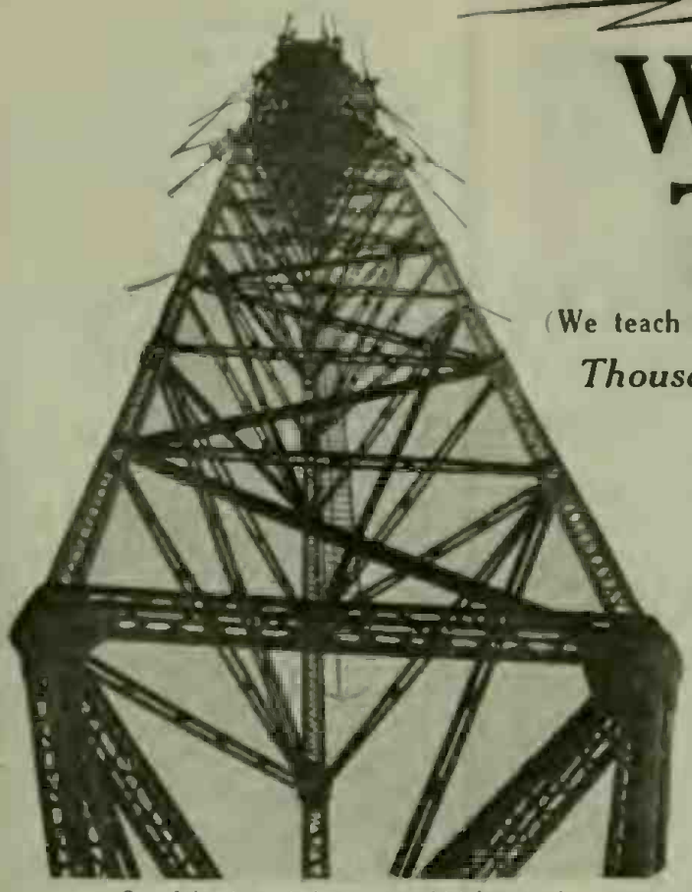
In Fig. 7 is delineated a radio telephone circuit using a vacuum tube for the generation of sustained oscillations. The grid and plate are coupled magnetically thru inductance L_2, which also energizes the antenna circuit thru inductance L_1. Condenser C is used to tune the oscillatory circuit CL_2. The plate voltage in this work is considerably higher than the plate voltage used in receiving sets and it usually ranges from 300 to 1500 volts. This is usually accomplisht by the use of the generator G. The inductance L_3 which is a choke



Special Form of Loose Coupler Provided with Five Coils, for Use with Regenerative and Wireless Telephone Audion Circuits Here Described.

With all the above circuits so far described, it will be noticed that the regenerative coupling is accomplished in the antenna circuit, thereby amplifying the incoming radio frequency oscillations and therefore producing maximum amplification without the loss of any feeble currents due to coupling in the secondary oscillatory circuits, which means of regeneration of incoming signals is accomplisht with present forms of circuits. Thus, it is seen that direct results and better efficiency can be accomplisht with the circuits described.

Fig. 6 outlines a circuit similar to Fig. 5 in which the plate of the first vacuum tube is coupled magnetically thru coils L_4 and L_5. The purpose of another vacuum tube coil is used to prevent high frequency currents from the plate circuit entering the generator. Modulation is accomplisht by shunting a telephone transmitter T, thru a resistance R and battery B across the grid and filament of the tube, as indicated.



Another successful circuit is shown in Fig. 8 and voice modulation in this circuit is accomplisht by coupling the telephone transmitter thru an induction coil I, comprising coils L_8 and L_9. The primary L_8 is connected to the transmitter and battery B, as shown. The modulated wave is imprest upon the grid in the vacuum tube, which wave is superimposed upon the main radio frequency oscillations.

(*Continued on page 76*)

Two Stage Audion Amplifier, the Circuit of the Second Audion Being Magnetically Coupled to the First Audion Circuit. Amplifying Power 1,000 Times and Better.

One of the giant wireless towers which keeps us in constant communication with Europe

Wireless in Ten Weeks

(We teach you in your own home during your spare time)

Thousands of operators needed for America's Merchant Marine

The age of wireless is here. The experimental stage has passed. Wireless now equals in importance telegraphy, and telephony. It has assumed its place among the great commercial industries of the earth. So rapid has been the development and growth of wireless in recent years that there has been left in its wake a tremendous shortage of operators. Actually thousands upon thousands are now needed for permanent "peace time" positions offering wonderful opportunities for advancement.

Earn up to $200 per month

In the short period of ten weeks we can make of you a wireless operator, a man with a profession, independent, and not subject to the rise and fall of wages in the labor market. Salaries are as high as $200 per month. There is a position in the merchant marine, the army, the navy, or a land station, awaiting everyone completing our course. We give you this training at home, by mail, in your spare time. It is not necessary for you to lose any time from your work to take the course.

Free Instruments—

While a student of our course, we present absolutely FREE to every student enrolling with us a Standard Set of Instruments (the same as used by the Government in testing applicants for first grade commercial licenses). This machine sends and records messages.

Travel the world over or locate at a land station in America.

America is spending billions of dollars on the mightiest navy and merchant marine in the world. Practically all vessels are being equipped with wireless apparatus of the most up to date type. Thousands of operators are needed now. The field affords a wonderful opportunity for the man who starts now to master wireless.

Our students actually pass the commercial examination in ten weeks or less.

Get your instruction from the Nation's Capitol. Our course is endorsed by officials of the U. S. Government.

The National Radio Institute, headed by authorities who have been closely allied with governmental training of students, has perfected an easily mastered course in wireless telegraphy whereby students are taught completely in ten weeks, either here in Washington at our large residence school or at home by mail. Many of our students are ready to take up actual wireless work in much less time. The course is founded on actual practice, hence the rapid progress of the student.

A Valuable Book Free

Our booklet, "Wireless—The Opportunity of Today and the Greatest Field of the Future," gives you complete information in regard to our course, the quick and easy methods by which you can master wireless and other important facts you should know. It is free. Just mail the coupon. No obligation whatever on your part.

TWO TYPES OF MICA TRANSMITTING CONDENSERS SUITABLE FOR MODERN AMATEUR APPARATUS. 21000 VOLTS. .004 MFD.

Make Your Wireless Apparatus Send Further
Last Longer and Work Better

The wireless amateur and experimenter is once more busy constructing apparatus for use the moment that orders go forward allowing amateur stations to open.

The kind of apparatus you used before the war doubtless answered your purpose nicely, but just consider the tremendous advancement made in the art during the past two years and you will appreciate your modern apparatus must contain several new types of equipment to bring it up to date.

DUBILIER
MICA CONDENSERS

proved their real worth in the Navy, the Signal Corps, and as a part of the equipment of the fighting Airplanes both here and abroad since 1916.

You can now purchase a genuine DUBILIER MICA CONDENSER for your new set for any voltage and capacity. They replace Leyden Jars with greater efficiency and without brush discharge and with negligible losses. They are compact and indestructible.

Made in any capacity and up to 1,000,000 volts. Special condensers supplied for experimental work.

Used in practically every Government installation.
DUBILIER MICA CONDENSERS are now ready for your use.

	Type A	Navy Type
.002—21000 volts	$11.00	$18.00
.004—21000 volts	20.00	35.00

Boys! You Can Make Your Own Electrical Apparatus with the aid of these wonderful books
Home-made Electrical Apparatus

By A. M. Powell

Three wonderful big books, chuck full of just the sort of information you have been looking for and at a price within reach of your pocket book. Each volume is printed on heavy paper, contains 75 pages and over 60 **illustrations, complete working drawings for making every sort of electrical apparatus.** Written so you can understand them. The price is only 25 **cents per copy**—practically the cost of publication. See partial table of contents below and order now. The supply is limited.

Vol. I Contains *working drawings* and directions for making all sorts of Static Machines, Static Apparatus, Home-made Batteries, Storage Cells, Transformers, Rectifiers, etc.

Vol. II contains *working drawings* and directions for all sorts of Voltmeters, Ammeters, Galvanometers, Switches, Rheostats, Telegraph Keys, Sounders, Telephones, Shocking Coils, Spark Coils, Experiments, etc., etc.

Vol. III contains *working drawings* and directions for making all sorts of Dynamos, Motors, Electric Engines, Miniature Lighting Plants, Wireless Telegraph Apparatus, Tesla Coils, Wireless Telephone, Electroplating, Experiments, etc., etc.

Any of these wonderful books will be sent to you *postpaid* for 25 cents.

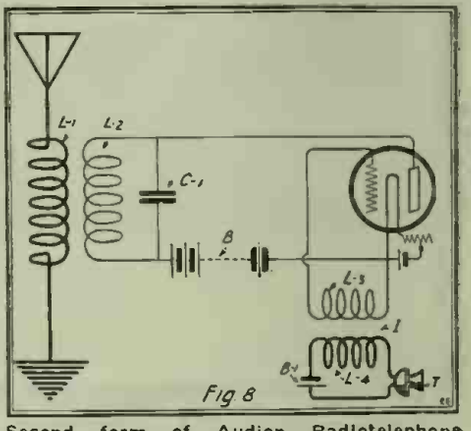
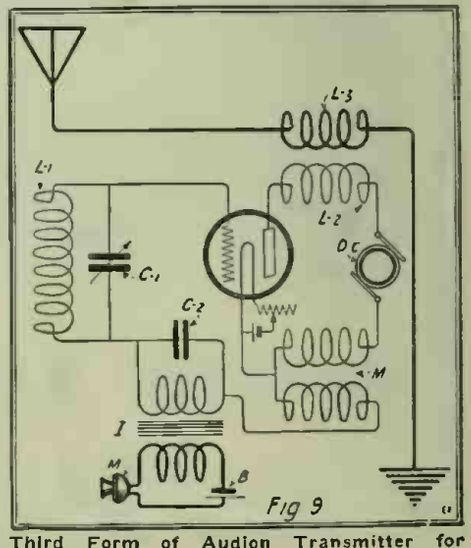
NEW REGENERATIVE VACUUM TUBE CIRCUITS.



(*Continued from page 74*)

Another circuit to accomplish the same result as above, is indicated in Fig. 9, in which case the oscillations are started thru the coupling coil M and the voice modulation imprest upon the grid circuit is ac-



First Form of Radiotelephone Transmitting Circuit, Utilizing an Audion, of Interest to Amateurs.

complished thru the telephone induction coil whose secondary is connected thru the grid and one leg of the coupling coil M, and the other to the main oscillatory coil inductance L_1. The primary of the induction coil is connected with the microphone and battery as indicated. Tuning is accomplished with condenser C_1, which is in the oscillatory circuit C_1L_1. Energy trans-

Second form of Audion Radiotelephone Transmitter with Magnetically Coupled Modulating Circuit.

ferred to the antenna circuit is accomplished thru the plate inductance L_2, inductively coupled to the antenna inductance L_3. To reduce the impedance of the grid circuit due to the high inductance of the secondary of the telephone induction coil, it is necessary to shunt a capacity C_2 of considerable magnitude to overcome this excess impedance.

Third Form of Audion Transmitter for Radiotelephony.

www.americanradiohistory.com

PUTTING IT OVER ON FRITZ.

(Continued from page 22)

see the sector thus marked out—by triangulation the position of every wireless sender could be ascertained—abandoned. This prediction came true every time, and tho the secret was guarded jealously during the war, it now can be let out, as Germany is harmless, and every other nation knows just how the prophecy was made.

It was not often that the Germans kept Allied brains working overtime on a puzzle. In a single instance, however, the Huns thought up a devilishly clever plan for getting secret information into Germany. This was called for weeks and weeks the "Nauen-Madrid Buzz."

Nauen, of course, was the official German Government wireless station, while in Madrid, Spain, was situated a station capable of sending messages to any part of the German empire in Europe. During all the months of the war in which direct communication between Germany and the outside world was practically severed official war bulletins and "inspired" news came out from Nauen thru Madrid. The latter station sent back neutral news and views of the war.

In the spring of 1917, however, came a queer development. Every now and then Nauen would seem to be badly bothered by "static" or by some imperfection in the sending apparatus. The station would emit an unintelligible buzz, like unto no message known to operators. This was regarded with grave suspicion by the Allied intelligence departments, and when Madrid started the same thing a whole corps of military wireless detectives were assigned to the problem. No one doubted that this was some new form of communication, but what on earth could anyone make out of that continuous buzz?

Weeks past with no light on the question. The two stations had grown bolder and were using the buzz constantly. Valuable information leaked to the enemy, and it was made practically certain that the "buzz" was responsible.

The mystery was solved by the help of a lucky accident. The technique of studying every code wireless message of the enemy had been to take down the sounds of the spark on a cylinder phonograph record; this gave the intelligence officer an accurate reproduction at any time he desired. On the occasion mentioned an officer had been trying to establish some basis of similarity between several of the records without success, when his machine ran down. As the needle grated to a stop on the cylinder the officer sat up suddenly. He thought he detected something that sounded just a little like a message!

He wound the phonograph and turned its speed indicator down so that the record revolved only a few times a minute. Then he applied the needle again. Aha! *There was something there!*

Tho this arrangement gave him insufficient to enable him to solve a code, he had the idea. Next the phonograph cylinder was attached to a motor, revolving at three hundred revolutions a minute, and several records taken at high speed of the peculiar buzz. When these records were re-run at moderate speed it was simple; the messages were decoded in an hour and were found to be questions and answers on topics the Germans were not even supposed to know existed!

The method used by the Germans and by the Madrid operator had been simply to punch in the message on a perforated paper roll. Then running this thru the sending equipment at high speed the message had gone into the ether waves at too rapid a rate to be caught by ordinary methods. At the other end the receiving station used the phonograph equipment to catch and record the message.

Brandes "Superior" Head Set, complete with head band, $6. A professional set within the means of every amateur. 2000 ohms.

Five Points of BRANDES Superiority

Brandes wireless headsets score 100% on the five factors that determine the efficiency and value of receivers for both professional and amateur use.

Sensitiveness: Brandes receivers do more than make weak signals *audible;* they make them *readable*,—clear and sharp This is because both receivers are exactly matched in tone.

Dependability: Made by hand by an organization which manufactures wireless receivers *only*, carefully measured by a micrometer for exact construction, and tested against a standard receiver—Brandes headsets can be counted upon for absolute dependability under every condition.

Lightness: Because Brandes headsets were first designed for professionals, they are so made that they can be worn long hours without discomfort.

Service: With ordinary care, Brandes receivers give service indefinitely. Hundreds of owners would not exchange sets several years old for new ones.

Appearance: Compact in size, correct in head band design, with an orderly arrangement of cords, and made from the finest materials, Brandes headsets have a handsome, efficient appearance.

Booklet "E" will be sent upon receipt of 4c in stamps.

LEARN TELEGRAPHY WITH THE OMNIGRAPH

The Omnigraph Went to War-- But It's Home Again

During the war, scarcity of material and orders from the Government and from the leading Universities, Colleges, Telegraph and Technical Schools, closely connected with the Govt. in teaching the Codes, made it impossible for us to make prompt shipments to individuals and to the trade.

We are now filling all orders promptly.

The Omnigraph Automatic Transmitter will teach you the Continental and the Morse Codes, at home, in half the usual time and at the least possible expense.
THE OMNIGRAPH, connected with your Buzzer, or with Buzzer and Head Phones or with Sounder, will send you unlimited Wireless or Morse Code messages, by the hour and at any speed you desire. Impossible to anticipate.
We offer the **Omnigraph** as a positive success and with the strongest of endorsements. It has been adopted by the U. S. Government, Department of Commerce, and is used to test all operators applying for Radio licenses. Many leading Telegraph Schools use **The Omnigraph** to send to their students in preference to hand sending. Ask us for their names if you so desire. We have hundreds of unsolicited testimonials and with permission we are publishing one of them.

205 New Jersey Ave.,
Anglesea, New Jersey.
Feb. 17th, 1919.

The Omnigraph Mfg. Co.,
39 Cortlandt St., New York City.
Dear Sirs:—Received my Omnigraph No. 2 with a set of Morse and an extra set of Continental Dials and wish to thank you for your prompt shipment.
Five minutes after I had received the box, I had it unpacked and working. I cannot praise it too much and a friend of mine as soon as he heard it, said: "Why, man, that sends PERFECT Morse and Wireless." I will give you all the praise that I can. I myself doubted that the machine would do all you stated but it does all you state AND THEN SOME.
Hoping to be of help to you and wishing you the best of success in your business, I remain
Very truly yours,
(Signed) Thomas W. Braidwood,
Pres. Cape May County Radio Asso.

205 New Jersey Ave.,
Anglesea, New Jersey.
Feb. 20th, 1919.

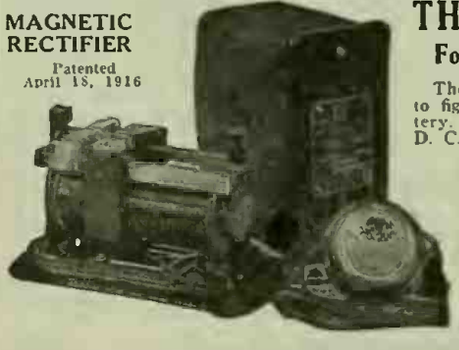
The Omnigraph Mfg. Co.,
39 Cortlandt St., New York City.
Dear Sirs:—In reply to your letter of 19th inst., I am GLAD to give you permission to use my previous letter in any way you see fit.
Two weeks ago I could not receive enough Morse to understand what a person was saying but today I can receive about ten words per minute on my Typewriter when the OMNIGRAPH is sending.
I have a First Grade Commercial Radio Operator's License and am using the OMNIGRAPH to better my receiving and to fit me for land telegraphy.
Wishing you the best of success for the future, I remain,
Very truly yours,
(Signed) Thomas W. Braidwood, Radio 3 U Z.
Pres. Cape May County Radio Asso.

If you are a beginner, it will make you an operator in the shortest possible time.
If you are already an operator, the OMNIGRAPH will make you a better one.

Send for free catalog describing 3 different models—$9.00 to $23.00—or order direct through your Electrical Dealer. We sell the **Omnigraph** under the strongest of guarantees—you must be satisfied or your money back.

THE OMNIGRAPH MFG. CO., 39 L. Cortlandt St., New York

How did you learn to talk? By listening.
JUST LISTEN,—THE OMNIGRAPH WILL DO THE TEACHING



DUCK'S BIG 300 PP. Wireless & Electrical

Catalog is now as it always has been, the largest and most complete and dependable Wireless Catalog published. Mailed for 12c in stamps or coin which may be deducted on first order of one dollar. Catalog not sent otherwise. This catalog costs us twice the price of other catalogs.

Everything in wireless *worth while* is listed in this catalog. The experienced amateur will tell you to see our catalog before buying. You are thereby insured against an unwise purchase. It is the *Beacon Light* to guide you right in the selection of your wireless apparatus. No bigger or better values are obtainable elsewhere. Send for revised price list. It is yours for the asking.

THE WILLIAM B. DUCK CO., 230-232 Superior St., Toledo, Ohio

MAGNETIC RECTIFIER
Patented
April 18, 1916

THE F-F BATTERY BOOSTER

For Home Charging and Service Stations

The wireless ban will soon be lifted, and it is time to figure what Rectifier you need to charge your battery. The F-F Outfit is furnished for either S. C. or D. C. current and attaches to any light socket, making a convenient, simple, economical, and reliable home charging situation.

The battery must be charged often to maintain a high point of efficiency and keep the plates above the critical sulphation point. This will prolong indefinitely their life and usefulness.

Advertising Talks
NUMBER 2

IF you have ever stopped to figure out the terrific cost involved in publishing a magazine, and the small amount of money that you pay for your issue each month, you probably wonder how a publisher can afford to give you as much as he does. If it were not for the advertising carried, he could not do it. Your 20c would not buy a magazine one-half the size, or quality, of the "Experimenter" unless that magazine were supported by the advertisers who use its columns every month.

The *Electrical Experimenter*, especially, costs a vast sum of money every month to produce. The magnificent wash drawings and expensive cuts that you see in every issue and which have made the "Experimenter" famous are only one of the many items that makes the publishing of your magazine a severe and heavy strain. The price you pay for your copy helps to meet part of this expense, but the advertisers foot the most of the bills. Don't let that fool you, however. They are not doing it for any love of the "Experimenter"—it is a business proposition with them. Each and every one have something that they feel is of interest to you. Perhaps it is a piece of merchandise that they want to sell; a new wireless outfit, a correspondence course that they know will improve your mind and equip you to earn more money; maybe it is a book or a novelty that you would enjoy having; but, whatever it is, they are willing to pay their good money to support the magazine in order that the magazine can print their advertisements.

The more advertisers we have, the more income there is each month, and the publishers of the *Electrical Experimenter* have committed themselves to putting back into the magazine, in enlarging its size, and improving its articles, and its drawings, every penny that comes in through the circulation or advertising. You will notice that with this issue eight more pages of *pure text* have been added, making this number the biggest ever published. This was made possible by the big increase in advertising during the past few months. You can help the work along and make the magazine still larger and better, if you will purchase what you need and the things you require in your work or for your pleasure, from the advertisers who are helping you. Read what they have to say in every issue, and when you want anything, no matter what it is, look it up in the advertising columns of the "E.E." and send your orders to those firms who are helping give you a magazine that you would not want to do without.

Live concerns that advertise sell better goods and at a cheaper price, *quality considered*, than unknown firms who persist in "hiding their light under a bushel." Next month I will tell you the real reasons why the quality of any advertised article has to be the very best and show you why you should patronize your own advertisers for this one reason, if for no other.

Advertising Manager.

Mesco Telegraph Practice Set

For Learning Telegraph Codes

The Practice Set comprises a regular telegraph key, without circuit breaker, a special high pitch buzzer, one cell lied Seal Dry Battery, and four feet of green silk covered flexible cord.

The key and buzzer are mounted on a highly finished wood base, and three nickel plated binding posts are so connected that the set may be used for five different purposes.

List No.		Price
342	Telegraph Practice Set, with Battery and Cord	$3.24

Weighs 4 lbs. packed.

Price does not include postage.

MESCO Combination Practice Set for learning the Morse and Continental Visual and Audible Codes

This outfit is the only reliable instrument which will enable students to become proficient operators in the U. S. Naval Service, because it is equipped with a buzzer and miniature lamp enabling the user to master both the visual and audible signals quickly.

List No. 52—Practice Set with Red Seal Battery and Cord $4.05

Weighs 4 lbs. packed. Price does not include postage.

Send for the New Edition of Our Catalog W28

The Electric Safety razor makes shaving a pleasure. Blade vibrating 7,200 times a minute cuts the beard smoothly and without slightest pull or irritation—feels like a gentle massage. Can be used with or without electric current.

All users of the Lek-Tro-Shav speak well of it

A barber says—"Have shaved for years and have never used any shaving device near its equal."

A home user says—"The most pleasing shave I've ever had in my life. Shaves my face closer than I used to shave, but there is no after irritation or ill effects as I usually get from another razor."

No. 1 Made for use from Light Socket.

No. 2 Made for use from Dry Battery.

Write for illustrated circular describing Lek-Tro-Shav Safety Razor fully.

PRACTICAL CHEMICAL EXPERIMENTS

(*Continued from page 34*)

clean cut, due to the shears. Since new wool is distinctly elastic, there is a certain amount of *give* to the fibers when subjected to tension. In the case of wool that has been scoured and dyed, the elasticity has somewhat decreased, the fibers becoming considerably firmer. If subjected to tension and rupture, the break has the appearance of a fracture, like a bone.

Referring to Figs. 9 to 18, inclusive, Fig. 9 shows shoddy made from new, fine, blue worsted clips. Notice the great variety of broken ends of fibers, and also the tendency of the fibers to split or tear lengthwise. The fibers showing the side breaks are evidently due to a tearing action of the shoddy machine.

Fig. 10 is a shoddy made from new, fine, black worsted clips. Here again may be noticed their peculiar terminal fractures, where the fiber has been pulled asunder. One of the fibers has a number of *spines* projecting from it. These so-called *spines* are really the fiber cells, which, no doubt, were loosened by the tension on the fibers in the machine. Note that both Figs. 9 and 10 represent new wool that has been simply mechanically reduced to shoddy, and at no time carbonized.

Fig. 11 is shoddy made from carbonized brown serge. Here it may be seen what indicates the brittle character of the fiber, devoid of elasticity. The breaks of the fibers are seen to be quite abrupt.

Fig. 12 is a shoddy made from brown serge that has been carbonized and subsequently stript. The abrupt character of the breaks is plainly noticeable, while at the same time the fibrils comprising the body of the wool fiber are very distinct. Their presence may be attributed to the chemical action of the stripping.

Fig. 13 shows fibers made from blue serge that had been first carbonized, then stript, and afterwards dyed green. Here again we notice the tendency to break longitudinally, and where a terminal break occurs, the fibrils appear distinctly.

Fig. 14 is shoddy from the same batch as that shown in Fig. 12, except that it has been dyed a full red. Here we notice that one of the fibers has been split longitudinally, while the other three fiber terminals show break characteristics that indicate the brittleness of the stock.

Fig. 15 was originally a brown serge that had been carbonized, then stript, afterwards dyed a deep orange, and finally garneted. A great majority of the breaks of fibers in this sample are extremely abrupt. There appears to be no longitudinal ruptures, and this seems to indicate little or no elasticity. Even the fibrils do not show plainly.

Fig. 16 is a shoddy made from brown serge that has been carbonized, stript and dyed an olive shade. Here again we see the abrupt fractures of the fiber and a tendency to longitudinal splitting. The fibrils are entirely wanting.

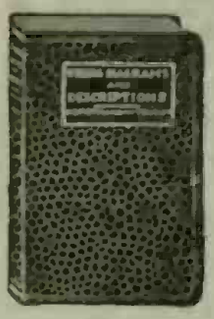

Fig. 17 is a shoddy made from various knit goods of different colors that were first carbonized, then stript, and afterwards dyed blue, producing finished colors of varied hues. The fibers show a rather curious side abrasion; a form of mutilation that appears to be quite common in this lot of shoddy.

Fig. 18 is a shoddy made from serges that were carbonized, stript and dyed a deep maroon. It will be seen that the tendency of some of the fibers is to split longitudinally. The terminal shown is characteristic of a fiber pulled apart lengthwise, when the fibrils have a tendency to separate, forming a brush-like head.

The various characteristics above re-

ELECTRICITY!

HERE'S just the book on Electricity that you need to answer your many questions—to solve your knotty problems, to teach you new kinks, to be your memory for tables, rules, formulas and other Electrical and Mechanical facts that some people try to carry in their heads—and fail.

With this "Little Giant" I. C. S. Electrical Engineer's Handbook in your pocket, toolchest, on your work bench, drawing table or desk, an hour or a day need not be lost "digging up" some forgotten rule, some unfamiliar fact; you'll just turn to the very complete index and get it "in a jiffy." Just a few of the subjects treated are:

Electricity and Magnetism; Electrical Symbols; Batteries; Circuits; Magnets; Direct and Alternating Currents; Dynamos and Motors; Belts; Shafting; Electroplating; Electrical Measurements; Meters; Arc and Incandescent Lamps; Mercury Arc Rectifiers; Transformers; Insulation; Electric Cars; Single and Multiple-Unit Control; Transmission; Rail Welding; Tables of Wires—Sizes, Capacities, etc.,—Mathematical Rules; Formulas, Symbols; Tables of Constants, Equivalents, Roots, Powers, Reciprocals, Areas, Weights and Measures; Chemistry; Properties of Metals; Principles of Mechanics; First Aid, etc.

The Electrical Engineer's Handbook is one of 22 I. C. S. Handbooks covering 22 Technical, Scientific and Commercial subjects. (See titles in coupon below.) They have the contents of a full-size book condensed into pocket-size ready to go with you anywhere and be at your instant command. Substantially bound in cloth, red edges, goldleaf stamping, printed from new, clear, readable type on good quality book paper and illustrated wherever a picture will help.

No Risk Money-Back Offer!

The price of the famous I. C. S. Handbooks, of which more than 2,000,000 have been sold and are in practical everyday use, is $1 per copy. So confident are we that you will find them exactly what you need for ready reference in your work, that we stand ready to promptly and cheerfully refund your money if for any reason you are not fully satisfied with their value. Simply send a letter or the coupon below, enclosing $1 for each book wanted. If at any time within 10 days you wish to return the books, your money will be refunded.

J. C. HAMILTON & CO., 7 Water St., Dept. B., Boston, Mass.

ferred to, and illustrated, will serve to draw attention to what one must look for in an examination of cloth that is believed to contain shoddy. In masses of shoddy such as are usually taken for microscopic examination, there will always be found many short fibers due to mechanical breaking of long fibers, but to separate them is an operation of great delicacy, tho yielding results of no value.

THE "BURNING" TEST

Vegetable fibers may be readily distinguished from animal fibers by burning. Animal fibers, such as Wool and Silk give off the smell of burnt horn. They do not fire like vegetable fibers, but cease to burn when removed from the flame, and the burnt portion curls up, forming a hard cinder at the end of the thread. Vegetable fibers, on the other hand, give off a slight smell of burnt wood when ignited. They burn away very rapidly with a flash, leaving no hard cinder, but a white or gray ash only. The above tests broadly distinguish vegetable from animal fibers, but further chemical examination is necessary to distinguish mixtures of any of them when woven into cloth. (See Fig. 19.)

Referring again to Figs. 1 (Cotton) and 4 (Linen) we can readily distinguish the difference by means of the microscope as shown. If the fabric is without starch, oil makes linen translucent and cotton opaque. The finish must be washed out of highly finished materials before this test can be used.

A test to distinguish between linen and cotton, which only an expert, or at least a person having quite some experience, can perform, consists of what is known as the *"tearing"* test. The linen weaves in general are more difficult to tear than cotton. The torn ends of the linen threads appear uneven in length and the individual fibers are twisted in every direction. The sound of tearing linen is shrill, and that of cotton dull or muffled.

An easy way to distinguish between the highly-sized and calendered *Cotton Damask* and true *Linen Damask* is to boil a sample. After being dried and ironed, if it is *cotton it will have a dull and somewhat fuzzy appearance*, while the *luster and smoothness of real linen will not be affected* by this treatment. *Mercerized Cotton Damask* keeps more luster than untreated cotton, but less than linen.

Since the price of pure, new wool is relatively high, it is the practise of manufacturers to mix other materials with it, the most common of which is *"Shoddy."* Such goods have many uses, being a full-bodied, but flimsy fabric, it is made chiefly into cheap cloth, table covers, etc. Manufacturers state that the best grade of worsted shoddy—that having long fibers—is superior to a low grade, short staple, new or virgin wool; also that it is impossible to get the texture and finish required for some of the best grade goods *without* the use of some shoddy. Owing to the fact that shoddy is made from wool fibers, as stated under the heading "Shoddy," it is very difficult to determine its presence by chemical means, owing to the fact that it will respond to the same tests as applied for wool. The microscope is the most accurate means available for determining the presence of shoddy in woolen cloth. It is true that the rough feel and cheap appearance of the fabric gives some idea of the presence of a *large percentage of shoddy*, but the famous "feeling test" for cotton or shoddy in moderate quantities must give way today to a more scientific analysis, as herein given.

Shoddy is not alone as an adulterant of woolens. Cotton is employed quite extensively. It is a simple matter to detect the presence of cotton, *as wool is dissolved in alkalies* and *not affected by acids* while on the other hand *cotton is dissolved by acids* and *not affected by alkalies*. Fig. 20 shows

WIRELESS TELEGRAPHY

Our 14 weeks course prepares you for MERCHANT MARINE paying $110 per month and expenses. RADIO INSPECTORS receive $1,200 to $3,500 per year. Our instructors are licensed by U. S. government; school fully equipped and largest of its kind in America. Tuition small and payable weekly. We guarantee to qualify you. Board and room in Washington at reasonable rates while taking the course. Particulars on request. SERVICE RADIO SCHOOL, 902 Pa. Ave. N. W., Washington, D. C.

a convenient method of testing for cotton and wool. One glass contains a solution of Caustic Potash or Caustic Soda into which is immersed a sample of the wool to be tested. A precipitat indicates the relative amount of cotton and other substances present. Likewise when cotton is immersed in an acid, the precipitat will show the relative amount of adulterants. See Fig. 7.

It is easy to determine heavily-weighted silk material by burning a small sample. Pure silk burns rapidly, smells like wool, and produces a small amount of brittle, curled-up ash. Material which is heavily-weighted will have an ash which is stiff and which often holds the shape of the sample. Cotton is frequently mixt with silk. It is easy to detect cotton in silk by the microscope, as the fibers of silk are round and smooth, while the cotton fibers are ribbon-like and fuzzy. See Fig. 8. Cheap but heavy silks are usually loaded with lead in granular form. A chemical test for lead will readily reveal its presence.

QUESTIONS AND ANSWERS

Ques. No. 5. Edward J. Walsh, Lexington, Ky., wants to know how he can remove Iodin stains from light clothing.

Ans. You fail to state whether the material from which you desire to remove the stains is starched or unstarched. This is an important factor. Stains which are present in unstarched material produce a brown or yellow stain. Whereas on starched materials, the presence of starch causes the stain to become deep blue or black.

Fig. 21. Removing Iodin Stains from Light or Other Colored Cloths By Application of Ammonia. The Ammonia May Be Applied With a Glass Rod or Sponge, and Should Be Immediately Washed Out as Soon as the Iodin Stain Is Removed.

For unstarched stains, sponging with Ammonia, or alcohol, the latter being frequently used on materials which water would injure. See Fig. 21.

Starch, such as prepared for laundry purposes may be used for washable materials. Immerse the stained parts in the starch and boil. It first turns blue and then disappears. Flour may be used in the same manner as the starch.

For starched materials, the stains may be immersed in a dilute solution of Sodium thiosulfate (known photographically as "Hypo") and then rinsed thoroly. Sodium sulfite (not sulfate) may be used in the same manner as the thiosulfate. Another method is to soak the stains in dilute ammonia (sp. gr. 0.95) until they disappear.

LISTEN TO ME!

Be A CERTIFICATED ELECTRICIAN

THIS IS YOUR CHANCE OF A LIFE TIME

I am Chief Engineer of the great Chicago Engineering Works. I am in close official touch with the electrical world. I know how badly we need trained electricians who can take charge of important work as experts. Right now there is such a need for executive electricians that I am making a special effort to help meet the demand. I am publishing this special announcement to secure a certain number of ambitious men whom I will personally train by mail for the wonderful opportunities that are open.

I WILL MAKE YOU a Trained Electrician

I don't care how young or old you are, just as long as you can read and write and have a spark of ambition. I don't care where you live or what you do. I don't care if you don't know a blessed thing about electricity. Just give me a little of your spare time for a short period and I'll show you the quick way to success in electricity. You can qualify to earn **$36 to $100 a week** with opportunities for greater earnings.

I Train You by Mail!

Your spare time will do. No interference with your regular duties. I understand just what you must know and I have devised a wonderful way of instructing by mail. I positively guarantee your satisfaction.

Free Wonderful Electrical Outfit

Absolutely free. Not a penny cost to you now or later. To those who act at once I will give a wonderful set of Electrical Equipment with my compliments. Write me at once. I have only a limited number of sets to be given free. Drop me a post card or letter.

Write! You will have to act quick to get in on this opportunity. Write me today for full particulars. Drop me a post card. *Write Now.*

Super-Sensitive Microphone ONLY $7.50

This instrument is offered at an extremely low price. It is excellent for building your own amplifier. Can also be used in many experiments where a sensitive microphone is required.

Detectagraph, $15

Detectagraph $15

This detecting instrument of marvelous sensitivity can be used for detecting secret conversations. Outfit consists of Sensitive Transmitter, 25-ft. Black Cord, Receiver, Headband, Case and Battery.

Send for One Today and Convince Yourself.

THE $15 MICROPHO DEAF-PHONE

is a super-sensitive instrument which has been developed to meet the demands for a practical and efficient hearing device at an extremely low price. It is equal to any $35 instrument made and superior to most of them. The outfit consists of One Super-Sensitive Transmitter with cord connector; One Super-Sensitive Ear Piece with small black cord; One Black Single Headband; Black Case and Two Batteries. HOW THE FRENCH LOCATED SUBMARINES.

(*Continued from page 9*)

major problems, if not indeed the predominant one, to be met with in working out a more selective and accurate form of submarine listening device was that, whatever its form, it should be susceptible of operating and functioning on any vessel while it was under full headway, and further, that the indications given by the instrument of the direction of such sounds should be sufficiently accurate to permit the commander of the vessel on which it was installed to set a straight course for the indicated spot where the submarine lay in wait for its prey. Contrary to general opinion, many authentic instances are on record where submarines were surprised in this way during the war and sent to the bottom, sometimes by armed merchantmen or converted yachts, and again by fast destroyers or submarines. The English in particular seem to have obtained very gratifying results in fighting the U-Boats with their own submarines.

Lieut. Walser designed his apparatus after first carefully studying a well known, yet heretofore overlooked, principle of physics, viz: that sound, identical to light, upon passing thru one medium into another, is *refracted*. The orthodox theory concerning the complex light beam or ray from a given object states that they comprise a number of component waves, which may be considered as parallel when their source is situated a sufficient distance, and which parallelism is upset only when an obstruction is placed in their path, when they are thus caused to enter a new medium having a density of a different value from that in which they were propagated. Lieut. Walser had the forethought to perceive that sound waves must follow the same theory. To prove his theory, he interposed in the path of sound waves a device which would respond to various vibrations, and which formed what we might term an *acoustic lens*. As has been found in explaining the theory of light transmission, a similar effect takes place in sound transmission thru the air or water and other mediums, and the result of thus interposing such an acoustic lens or vibrating member causes the individual waves composing the complex wave propagated from a given source to come to a focus. This has the two-fold effect of intensifying the individual waves and also of isolating them precisely from other sounds emanating from the sources foreign to the one being localized. Naturally, the different sources of sound will create a corresponding number of foci, of which the geometric focus can be ascertained by mathematical computation. In a similar manner from the position of the sound focus which corresponds to any individual source of sound, the definite direction of that source can be readily estimated.

The accompanying illustrations show the "Walser submarine detector" gear as installed on French vessels, and the detail view shows how the sound detecting lenses, which are fitted into large steel bulges or "blisters", secured to the hull of the vessel, are connected to two trumpets, which may be traversed in a circle above them, so as to accurately localize the various sounds heard from different vibrating diaframs comprising the lenses. One trumpet picks up and localizes the sounds from the *port* lens, and the other the sounds picked up and intensified by the *starboard* lens. The spherical segments supporting the multiplicity of lenses is indicated by *A* in the detail figure. This segment is provided with a circular series of openings, *B*, each of which contains a sensitive vibrating diafram, *C*. The general effect of this arrangement is to focus all of the sounds picked up, the focal points all lying on a circle, *I*. As aforementioned, the vessel fitted with this apparatus has two of these lenses, one to *port*

Tobacco Habit BANISHED in 48 to 72 Hours

No craving for tobacco in any form when you begin taking Tobacco Redeemer.

Don't try to quit the tobacco habit unaided. It's a losing fight against heavy odds and means a serious shock to the nervous system. Let the tobacco habit quit YOU. It will quit you, if you will just take Tobacco Redeemer, according to directions for two or three days. It is a most marvelously quick and thoroughly reliable remedy for the tobacco habit.

Not a Substitute

Tobacco Redeemer contains no habit-forming drugs of any kind. It is in no sense a substitute for tobacco. After finishing the treatment you have absolutely no desire to use tobacco again or to continue the use of the remedy. It makes not a particle of difference how long you have been using tobacco, how much you use or in what form you use it—whether you smoke cigars, cigarettes, pipe, chew plug or fine cut or use snuff, Tobacco Redeemer will positively banish every trace of desire in from 48 to 72 hours. This we absolutely guarantee in every case or money refunded.

Write today for our free booklet showing the deadly effect of tobacco upon the human system and positive proof that Tobacco Redeemer will quickly free you of the habit.

and one to *starboard* of the keel. Just over these two lenses, there is built a specially solid sound-proof room or cabin, in which the operator of the submarine detector is located. The arrangement of the apparatus is such that the operator can sit in the center of the cabin with the listening helmet on his head, and by means of two ear trumpets. *D*, in the diagram, any sounds passing thru the lenses can be quickly picked up and localized for direction. One trumpet takes care of the sounds from the port lens and the other the starboard lens.

By means of the large rotating drum, which appears just to the right of the operator, the edge of said drum being calibrated, so that as the handle of the drum is turned the trumpets over the lenses are rotated about the respective focal circles of any sounds received. The control drum, which is manipulated by the operator, revolves the trumpets, *D*, which are pivoted on a fork, *E*, thru the movement. *H*. *J* represents the counterweight, which by means of cord, *K*, maintains the trumpet in such a position that its axis is always pointed toward the center of the spherical lenses. The function of the counterweight, *L*, is to maintain the balance of the movable arm on which the trumpet is supported, while the weights, *M*. *M'*, cause this arm to oscillate about the pivots, *N*, *N'*, in such a way that the rolling of the vessel is counterbalanced, thus tending to keep the mouth of the trumpet in the same horizontal plane at all times. The complete apparatus is carried by the metal frame marked *O*.

With the apparatus in use, the operator hears the sound with the greatest intensity and sharpness when the trumpet axis is in line with the focus of that particular sound. He can also hear a certain sound when the trumpet is anywhere in the vicinity of the focal point. The operator proceeds in any event to explore the various foci by manipulating the central control drum, which revolves the trumpets around the focal circles. This centralized control drum having been calibrated beforehand, it becomes a simple matter for the observer to accurately locate the direction of a certain sound, or more strictly speaking,—its origin, as soon as he has manipulated the trumpet to the proper focal setting, so as to hear the received sound with the greatest intensity and clarity. By a quick calculation based upon the value of the minimum intensity of the sound received, the range of the submarine can be approximately calculated. It is then a comparatively simple matter to steer a straight course for this spot, and if the object of the search turns out to be a submarine, then the destroyer will pass over it and discharge depth bombs upon it.

Of course the wiseacre will say, it is all very well to locate a submarine and then steering a course so indicated for the object of dropping several carloads of "ash cans" (depth bombs, in navy vernacular) upon it, but what about the movements of the U-Boat, which may have paddled off a mile or so from the spot so dear to the heart of the naval officer. This problem would seem to be solved by the fact that contrary to the usual apparatus utilized for such purposes heretofore, the operator may keep right on taking the soundings of the submarine, while the vessel is under full headway and moving toward it. The sensations experienced by the submarine detection officer located in his steel-bound cubbyhole down near the keel of the on-rushing vessel, as the sound of the submarine's engines and propellers pound louder and louder in his ear trumpets, probably can be better imagined than described, for the submarine commander may have a "card up his sleeve" and be just about scrappy and clever enough to lay for the on-coming destroyer or war vessel and discharge a torpedo at it or open up with a broadside from some nifty "seven inchers."

ASK YOUR BOSS "Does it Pay to Train?"

Put it up to the man who employs you. Don't hesitate. He'll respect and appreciate your interest. He knows the value of training—and will gladly tell you how much more you would be worth to him as a trained worker. If you're in doubt ASK THE BOSS. Ask him anyway.

A Bigger Job The position **in Your Factory** you'd like most in your factory is not beyond your reach. You can get that position any time you will fit yourself for it. Aim as high as you like and you will find that American School training will enable you to qualify for the job you want. KNOWING HOW doubles and trebles your earning power. If you don't think so—ASK THE BOSS.

Why Not Try This Guaranteed Training

The American School training is so thorough, complete and up-to-the-minute that it absolutely guarantees satisfaction or your money back. In other words, you can take ten full examinations in the Course you select. Then, if you feel you are not progressing—that the instruction will not enable you to advance—you simply notify us and your money will be refunded in full. The success of our thousands of students warrants this confidence in our ability to fit you for a better paid and more congenial position.

TRAINING Decides Your Pay

Make sure of this: the men who get more money in your factory than you do know more. Your position and pay at all times, and in any job, is governed simply by what you can DO. And that depends on what you KNOW. Make some of your spare time bring SUCCESS to you. Study in idle moments with GUARANTEED TRAINING. Make your start TODAY for a better job by checking and mailing the coupon. Free Bulletin and full details will be promptly mailed you without any obligation.

4 Famous Books!

EACH ONE A BIG SUCCESS!

THE BOOKS YOU MUST HAVE

Wireless Course in 20 Lessons

By S. Gernsback, A. Lescarboura and H. W. Secor. E. E.

A course that tells you everything you can possibly want to know about "Wireless" starting off in lesson No. 1 by explaining the Principles of Electricity. The second and third lessons are devoted to magnetism, motors, generators and wiring. And then, by simple, easy stages, this wonderful Course takes you into "Wireless". The mysteries of "Wireless" are unfolded to you by the use of such simple language so skillfully used that of necessity you must understand every word. The subject is not treated superficially, however, for there is a whole lesson devoted to the Theory and Mathematics of this epoch marking subject. To lend charm to the Course, the last lesson (No. 20) is devoted to a history of Wireless and the men who developed it.

Size of book is 7 x 10¼ in., 160 pages, 350 illustrations, 30 tables.

Experimental Electricity Course in 20 Lessons

By S. Garnsback and H. W. Secor. E.E.

A Course of the theory and practice of Electricity for the Experimenters. This is undoubtedly one of the most complete and comprehensive treatises of this special subject ever published. The book is written by the same authors as the famous "Wireless Course in 20 Lessons".

Every phase of experimental electricity is treated comprehensively in plain English. It is a book not only for the beginner but for every experimenter and student of Electricity. New Experiments are described and explained and nearly every application of Electricity in modern life is given in simple language.

The book contains 192 pages and more than 400 illustrations.

Flexible cloth cover...per copy $.50
Stiff cloth cover.....per copy 1.00

No. 1. How to Make Wireless Sending Apparatus

No. 2. How to Make Wireless Receiving Apparatus

By 20 Radio Experts.

Two Remarkable Books

Book No. 1 contains 100 pages, size 7 x 5 in. and 88 illustrations, paper bound.

Book No. 2 contains 100 pages, size 7 x 5 in. and 90 illustrations, paper bound.

These two books have been written and published entirely for the wireless enthusiast who wants to make his own radio apparata. They contain more information on how to make it than any other books we know of. Only strictly modern radio apparata are described in these books and the illustrations and descriptions are so clear and simple that no trouble will be experienced in making the instruments.

THE THOUGHT RECORDER

(*Continued from page 12*)

ent upon wave motion, it should not be surprising therefore that thoughts or active thinking should give rise to wave motion as well.

This theory is greatly strengthened by the fact that it has been proven beyond doubt that active thinking necessitates an expenditure of energy. If you sit perfectly quiet in a chair without expending any visible muscular energy, and if you concentrate very hard upon a certain problem, it is not infrequent that perspiration appears on your forehead from the simple effort of thinking. Of course, this is rather a complex phenomenon, as the perspiration is not produced directly, but rather indirectly by the nerve centers working upon the human organs, principally the heart. Nevertheless, we know that thinking proper calls for an expenditure of energy in the brain itself. That this energy is considerable can also be shown experimentally.

It therefore cannot come as a surprise that the act of thinking should give rise to a direct wave motion, sending out from the brain certain waves in an analogous manner, to the spoken word which produces sound waves of a certain wave length. It is quite probable, however, that thought waves are simply another form of ether waves, the same as radio waves or light waves. Just as light rays traverse thru a thick glass pane without suffering any appreciable loss, just so will thought waves probably pass readily thru the human skull. If once we admit this theory it follows that it should be possible to detect such waves, and the only thing we need to know about them are the wave length and other important characteristics. We may take it for granted that the human brain, sensitive as it is, probably is not at all sensitive to these waves, and that by suitable apparatus it should become possible to detect such waves.

Just what apparatus are necessary to detect thought waves, or the effects therefrom, the writer does not venture to predict, but there is no doubt that the apparatus will be eventually found. Very little is known about the emission of the thought waves, and as a matter of fact the entire mechanism which produces thoughts is practically an unknown quantity, but every effect can be translated and recorded if once we understand its fundamentals.

Thus, fifty years ago the recording of the voice would have appeared just as fantastic as the recording of thought appears today. People then rightly said, how could it be possible to hold the spoken word; it goes into the air and vanishes instantly. But once acoustics were better understood, it became a simple matter for the inventor of the phonograph to record the voice. Similarly, the day will come when thoughts will be recorded in an analogous manner. All that is necessary, as stated above, is suitable apparatus, and this should be easy to find.

The writer, in suggesting the audion as a thought-wave detector, does not do so because he thinks that it is suitable in all respects, or even feasible. His main idea is to set the stone rolling, and get other people to think about the problem, when sooner or later something surely will emerge. The writer has suggested the audion because it is known as one of the most sensitive electrical detecting apparatus for wave motion which we have today. If thoughts give rise to electrical waves, then by winding a few turns of wire on a headband and slipping it over the head, it should be possible to detect the presence of thought waves in the audion. On the other hand, too, the audion is enormously sensitive to capacity effects,

www.americanradiohistory.com

as is well known. Thus, for instance, an oscillating audion is so sensitive that when the human hand is approached to it at a distance of even two feet, the presence of the hand will be heard plainly in the telephone receiver. If this is the case, the disturbance created in the mind should certainly make its presence felt in the audion, for thinking being first of a chemical nature, the act certainly must give rise to capacity effects. But let us assume that active thinking does not give rise to waves, electrical or otherwise, then the mere chemical action (and resulting capacity effects) should produce a disturbing influence upon the audion. These variations, if ever so slight, could then be amplified by the use of an audion or other amplifier, and the resultant effect be sent into an Einthoven string galvanometer. The small mirror attached to the string of the galvanometer will send its luminous pencil upon a light-sensitive paper tape which moves at a certain rate of speed in front of the mirror. The result will be a wavy line traced upon the paper tape in the well-known manner. The paper tape traveling on will pass thru its fixing tank, and from there will emerge from the outside of the machine after it has past thru a small drying chamber heated by electrical coils.

From this, it will be understood that a man sitting in front of his Thought Recorder will be able to actually see on a tape his recorded thoughts, the same as the telegrapher working on a trans-Atlantic cable watches his tape and its wavy line produced by the Syphon recorder, emerging from the latter. Of course, it will be necesary for everyone to learn the "thought alphabet" just as the stenographer today must learn the various characters, or as the child is taught how to read and write, and as the cable operator must learn how to read the Syphon recorder "alphabet." All this, however, is simple, and is only an educational feature once the apparatus has been invented.

The objection naturally comes to the mind immediately that even if we have a machine to record the thoughts, all we will get on the tape will be a jumble of confused thoughts, and we might get a lot of things on the tape that were not meant for recording or registering at all. Such criticism, of course, is beyond controversy for the simple reason that when you write a letter by hand or on the typewriter, you have also at first a lot of confused thoughts, but you do not record such thoughts even by hand or by machine. It often happens after you have written down certain thoughts that you must change them. The same is true of the thought recorder, of course.

Here the man who is doing the recording has a push button in his hand, shown at A in our illustration; if he does not press the button nothing is recorded. Once he wishes to record his thoughts in an orderly manner, he pushes the button and the tape begins moving simultaneously—he will begin thinking in an orderly and slow manner the subject he wishes to record. He will think just as hard and just the same as if he were to pen down his thoughts by hand. The machine will then do the rest. If he thinks the wrong thoughts, naturally the wrong thoughts will be recorded, exactly the same as if he had written them by hand. There is no difference. In our illustration, our artist has endeavored to show what will happen in the future business office when the thought recorder comes into universal use. The business man of tomorrow will dictate his correspondence on the thought recorder, while his stenographer, who is perfectly familiar with his "thought writing," will type out the correspondence from the tape, which is kept moving by electric motors, in front of her eyes. A foot pedal stops or starts the motor, and there is also a reversing attachment so the tape will run backwards should she wish to re-read a certain portion of the tape.

Become a Doctor of **Chiropractic**

Advanced Science of Spinal Adjustment

Here is your opportunity to prepare yourself to enter the profession of Chiropractic—the modern science of relieving ills and ailments through spinal adjustment. No matter where you live or what you are now doing, you can enter this uncrowded profession—a profession of good incomes. Some of our graduates report they are making $3,000 to $5,000 and more a year. We teach you by mail or in class.

FREE 22 Complete Charts in Drugless Healing

As an extra inducement to quickly secure new students we will give you, absolutely free, our 72-page book and 8 Anatomical Charts, beautifully lithographed in lifelike colors, that regularly sell for $15, also complete set of colored Nerve, Pain Area, Concussion and other Charts that regularly sell for $16.50.

Don't miss this liberal offer. Get these free charts by all means. See how you may qualify as a Doctor of Chiropractic and what splendid opportunities this profession offers you for gaining an independence. Never before has the demand been so great for Doctors of Chiropractic. To meet this demand, we must have more students immediately. Write today.

Our Lessons Teach You how to make Spinal Adjustments for speedy relief of

Headache	Neuralgia
Indigestion	Neuritis
Lumbago	Catarrh
Epilepsy	Fevers
Pleurisy	Jaundice
Constipation	Dyspepsia
Rheumatism	Paralysis
Asthma	Etc., Etc.

Learn At Home To Be a **CHIROPRACTOR**

No special talent or advanced education necessary. If you have common school education, the way is open to you. This institution trains you either by mail or in class. Learn in your own home in your spare moments to be a Doctor of Chiropractic. It offers you a profession of dignity and prestige. Let us prove how YOU can make a good income. Makes no difference where you live or what you do now, you should be able to qualify rapidly for this great work.

Mail Free Coupon at Once

No obligation to you whatever. Put your name and address on the free coupon or letter or postcard and get the story of Chiropractic. You will be amazed, fascinated by the facts gathered together in our free book. Be sure to write at once if you want the free charts. Mail the free coupon or a postal today, right NOW!

What 15c will bring You from the Nation's Capital

Washington, the home of the Pathfinder, is the nerve center of civilization; history is being made at this world capital. The Pathfinder's illustrated weekly review gives you a clear, impartial and correct diagnosis of public affairs during these strenuous, epoch-making days.

The little matter of 15c in stamps or coin will bring you the Pathfinder 13 weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation; a paper that prints all the news of the world and tells the truth and only the truth; now in its 26th year. This paper fills the bill without emptying the purse; it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send 15c to show that you might like such a paper, and we will send the Pathfinder on probation 13 weeks. The 15c does not repay us, but we are glad to invest in new friends. The Pathfinder, Box 676, Washington, D.C.

Long Distance Phones $1

At last a real low priced telephone scientifically made in the Alrams Laboratories. It is not a toy and has all the features of the high priced telephones. You can have a corking good time with it. For instance, if you want to call your friend simply lift the phone off the hook and it will automatically signal and connect you with the next station. Then you can talk with your friend over the phone as long as you like. You will have your own private telephone and calling system with no operators to bother you or listen to your conversation. You can easily set up these long distance telephones from your house to the house of your friend wherever it may be located, across the street, next door or next block, or further, and you can talk as long as you want. There is no expense in operating these telephones. They are so scientifically constructed that no batteries are required. The phones supply their own current by means of a patented cable. This cable is guaranteed for lifetime without renewing. Each set of telephones are packed complete in a box containing 2 telephones, wires and complete instructions for installing and operating. Postpaid for $1.00. Satisfaction guaranteed. The Alrams Co. The House of Quality Peoria & 13th St., Chicago

Read this Remarkable Offer!

OFFER No. 1

Wireless Course

The most comprehensive Wireless Course ever printed. Contains 160 pages, 350 illustrations. Size of book 6¾"x10". Very fine flexible cloth cover.

FREE with a year's subscription.

Add 5c for postage

OFFER No. 2

Experimental Electricity Course

This masterpiece contains 160 pages, 400 illustrations. Size of book 5"x9". Printed on extra thin paper, so book can be slipped into pocket. Handsome flexible cloth cover.

FREE with a year's subscription. Add 5c postage

OFFER No. 3

How to Make Wireless Sending Apparatus
By 20 Radio Experts

How to Make Wireless Receiving Apparatus
By 20 Radio Constructors

These books are by far the most successful wireless books on the market. Size of each book 5"x7", well bound on good book paper. Covers in two colors. We really cannot praise these books too highly. Each book contains 100 pages and from 88 to 90 illustrations. BOTH books FREE with a year's subscription. Add 5c for postage

This is a very limited offer. It may be withdrawn at any time, due to the tremendous cost of paper, which IS JUST DOUBLE WHAT IT WAS ONE YEAR AGO. We have only a limited supply of these fine books on hand; after they are gone we cannot reprint the books until conditions become normal again. Now is your chance.

The publishers of this journal have earned an enviable reputation of giving more than 100 cents' worth for each dollar spent with them. Profit by this liberal opportunity NOW; it may never be made again.

HERE'S THE OFFER

Subscribe to the ELECTRICAL EXPERIMENTER for one year, at the regular subscription price of $2.00 per year (Canada, foreign and N. Y. C. $2.50) and we will send you either books shown in one of the above offers. If you subscribe for two years, two offers will be given, etc.

If you are a subscriber at present take advantage of this wonderful opportunity anyway. If you do, we will extend your present subscription.

This Offer Limited. *Act Now.*

The True Wireless

By Nikola Tesla

(Continued from page 63)

greatly from the intensity of the received impulses because the electric nivean between the mountains is raised, as I have explained in connection with my lightning protector in the EXPERIMENTER of February.

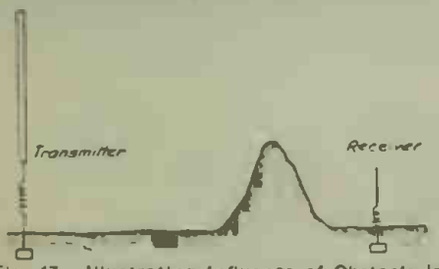

Fig. 17. Illustrating Influence of Obstacle in the Path of Transmission as Evidence Against the Hertz-wave Theory.

Again in Fig. 19 two transmitting circuits, one grounded directly and the other thru an air gap, are shown. It is a common observation that the former is far

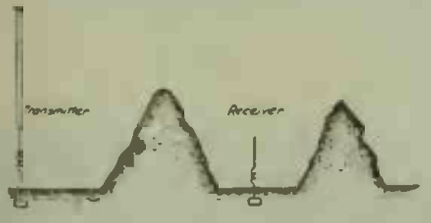

Fig. 18. Showing Effect of Two Hills as Further Proof Against the Hertz-wave Theory.

more effective, which could not be the case in a transmission with Hertz radiations. In like manner if two grounded circuits are

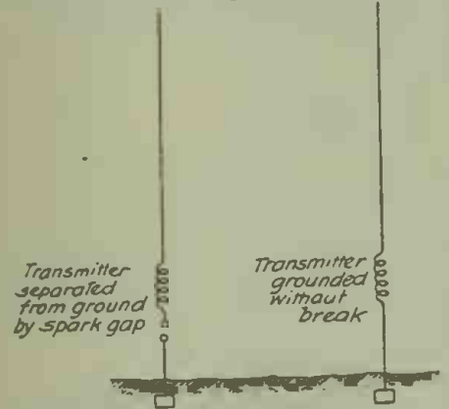

Fig. 19. Comparing the Actions of Two Forms of Transmitter as Bearing Out the Fallacy of the Hertz-wave Theory.

observed from day to day the effect is found to increase greatly with the dampness of the ground, and for the same reason

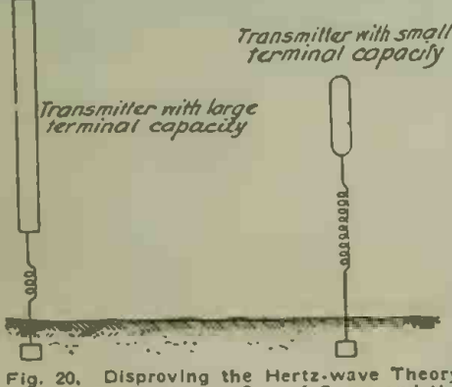

Fig. 20. Disproving the Hertz-wave Theory by Two Transmitters, One of Great and the Other of Small Energy.

also the transmission thru sea-water is more efficient.

An illuminating experiment is indicated in Fig. 20 in which two grounded transmitters are shown, one with a large and the other with a small terminal capacity. Suppose that the latter be 1/10 of the former but that it is charged to 10 times the potential and let the frequency of the two circuits and therefore the currents in both antennas be exactly the same. The circuit with the smaller capacity will then have 10 times the energy of the other but the effects on the receiver will be in no wise proportionate.

The same conclusions will be reached by transmitting and receiving circuits with wires buried underground. In each case the actions carefully investigated will be found to be due to *earth currents*. Numerous other proofs might be cited which can be easily verified. So for example *oscillations of low frequency* are ever so much more effective in the transmission which is inconsistent with the prevailing idea. My observations in 1900 and the recent transmissions of signals to very great distances are another emphatic disproval.

The Hertz wave theory of wireless transmission may be kept up for a while, but I do not hesitate to say that in a short time it will be recognized as one of the most remarkable and inexplicable aberrations of the scientific mind which has ever been recorded in history.

TO ALL RADIO AMATEURS

We have received many thousands of communications from radio amateurs for the past few months asking us about the status of their radio stations, and when they will be allowed to operate them again.

Inasmuch as there has been no official information as to the reopening of amateur stations, during the armistice, we can only say that in all likelihood, amateurs will not be allowed to operate until actual peace has been signed. In his executive order of April the 6th, 1917, President Wilson closed all radio stations in the United States by an act approved in the Radio Law of August 13, 1912.

Such a measure, according to law, is only for the duration of the war, there being at present no legislation which prevents any station, amateur or otherwise, from operating after peace has actually been declared. Therefore, the minute newspapers announce that peace between the United States and the Central Powers has been signed, *all amateur stations automatically revert to their former status*, and amateurs need not wait for permission to operate their stations, once peace has been declared.

EDITOR.

WRINKLES, RECIPES & FORMULAS.

(Continued from page 42)

If carbon dioxid is to be generated, fill tube A with marble chips and tube B with dilute hydrochloric acid.

It is evident that the parts of the generator can be easily cleaned and new chemicals put in. The completed apparatus is shown in Fig. 3.

Contributed by S. WEISINGER, JR.

Strengthen Your EYES!

Preserve Your Most Precious Possession

Your sight is your most precious gift. Weak eyesight means weak power of observation, eye strain, eye disease, and untold inconvenience. Take no chances with your eyes—you cannot get along without them. Make them stronger every day instead of weaker. Let us send you Bernarr Macfadden's wonderful new Course in "Strengthening the Eyes." Send no money—just mail coupon.

Glasses Do Not Remove the Cause of Eye Trouble

Instead, the eyes come to depend on them more every day. Glasses are eye crutches! They blindly bolster up the eyes—they do not strengthen them. It has been definitely proven that practically all defects of the eyes can be cured without glasses. Most people now wearing glasses can be freed from the inconvenience, and expense of constant breakages, by strengthening and correcting their vision through the simple, yet effective eye educational exercises recommended by Mr Macfadden.

Eye Defects Removed

This remarkable new Course teaches you how to use your eyes without strain at all distances—how to do without glasses—how to remedy cross eyes or squint eyes—how to restore the normal sight—how to restore perfect control to eye nerves and muscles.

Beneficial Results at Once

No drugs, medicines or operations. The Course includes a simple, yet thoroughly scientific system of eye educational exercises which strengthen the eyes exactly as the muscles of the body can be strengthened through body exercises. Results are immediate, and improvement continues daily. One woman writes: "I notice a great improvement in my eyes since learning to use their sight." Another user says, "Your Eye Strengthening Course' fine. My eyes are already improving." Still another writes, "Words cannot express my great gratitude for these excellent books." (Names on request.)

Send No Money

Let us send you this new Course "Strengthening the Eyes" on five days' approval. There are twenty-eight simple little lessons which will show you the way to strengthen and preserve your sight—the gift of the gods! Try the exercises, then return the Course if not satisfied and you will owe nothing. If, however, you feel that the Course will help your eyes wonderfully, send only $5.00.

Mail Coupon!

If you value your eyes, if you wear glasses and want to get rid of them, if your eyes are weak or strained, or if you want to insure freedom from eye troubles, mail coupon now and investigate this New Course "Strengthening the Eyes." Send no money—but mail coupon now, as this offer may never appear again.

FOR EXPERIMENTERS ONLY!!

WE have in the past held many extraordinary sales, but we believe that the present one eclipses all by the wonderful values we are offering. The goods which we offer on this page are all standard telephone apparatus. Every piece we are offering is equipment that for one reason or another was discontinued by the telephone companies. If you wanted to buy any of the pieces which we offer herewith, from the manufacturers, the price would at least be ten times what we are asking for it. You can readily ascertain this for yourself by looking over our wonderful prices.

We have bought a large block of these goods and have a large quantity of every item on hand. Immediate shipment can be made on all of the goods in practically any quantity within reason. *Shipment within twenty-four hours* will be made if you use the coupon at the bottom of this page. This coupon saves you several days and your order will then be considered a rush order. We guarantee every piece to be as represented, and we will refund the money if goods are not exactly as claimed by us.

NO. 1 TELEPHONE RELAY. 1500 ohms—has two silver-contact springs and is very sensitive. Can be used wherever a sensitive relay is needed. It is adjustable and can be used for a variety of purposes.
No. 1 Relay—shipping weight, 2 lbs. Price..... **$1.50**

NO. 2 STANDARD TELEPHONE Induction Coil. primary 1 ohm, secondary 55 ohms. Used wherever you need a good induction coil. Has primary and secondary and iron wire core; fibre heads.
No. 2 Induction Coil as described—shipping weight, 2 lbs. Price..... **$0.50**

NO. 3 STANDARD RESISTANCE wound with German silver wire—4,500 ohms, can be used as a choke or plain resistance, and has many other uses that readily suggest themselves to the experimenter.
No. 3 Standard Resistance as described—shipping weight, 4 oz. Price..... **$0.40**

NO. 4 HORSESHOE MAGNET. size 3¼ inches wide x 5 inches high. Will lift about 1 lb. Quality such as used on magnetos, which means the best.
No. 4 Horseshoe Magnet — shipping weight, 2 lbs. Price..... **$0.30**

NO. 5 REPEATING COIL (Transformer). This is a standard small repeating coil and is used by all telephone companies. It has 4 different windings and eight contacts. Entirely enclosed in iron. The resistance being respectively 72 and 120 ohms, and 90 and 100 ohms. Diagram is furnished. Can be used for wireless, for boosting signals, etc.
No. 5 Repeating Coil—shipping weight, 2 lbs. Price..... **$0.50**

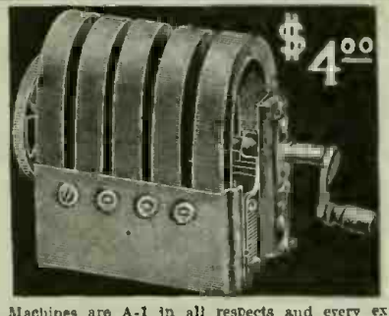
NO. 6 ½ M.F. CONDENSER. This is a standard telephone condenser and has ½ microfarads. Condenser comes in neat metal casing. This condenser is used in connection with spark coils to absorb the vibrator spark. Invaluable for test buzzers to absorb spark and make the sound of buzzer more steady. Is also used by every experimenter in connection with wireless where a fixed capacity is needed. Several of these condensers should be in every experimenter's laboratory.
No. 6 Condenser, ½ M.F.—shipping weight, 1 lb. Price..... **$0.50**

NO. 7 DOUBLE POLE BELL TELEPHONE RECEIVER—hard rubber casing with 4 ft. cord and tips. Standard 75 ohms—very powerful magnets. This receiver can be used in connection with any ordinary telephone work, and you will even find it sensitive enough for short distance wireless work.
No. 7 Bell Telephone Receiver—shipping weight, 3 lbs. Price..... **$0.80**

NO. 8 STANDARD TELEPHONE RECEIVER with Metal Head. This receiver is made by Stromberg Carlson Co., with genuine hard rubber handle and ear cap. A very good fool-proof as well as sensitive receiver that cannot be put out of order if you try. Used for the same purpose as No. 7 Telephone Receiver.
No. 8 Standard Telephone Receiver—shipping weight, 3 lbs. Price..... **$0.75**

No. 9 IMPEDANCE COIL (Close Core Transformer). This is a very fine little transformer and is used extensively in connection with telephone work. It is in reality an A.C. transformer for which you would pay $5.00 if you had it made to order. The primary has 0.15 ohms, secondary 2000 ohms. It can be used for a variety of purposes that will suggest themselves to every experimenter. Can be used successfully to boost wireless signals. Also in connection with audions, etc. An A-1 instrument. Size 3 x 3 inches.
No. 9 Impedance Coil—shipping weight, 2 lbs. Price..... **$0.65**

NO. 10 MICROPHONE AND BRACKET. An A-1 sensitive microphone of the carbon grain type. Has hard rubber mouthpiece and enamel steel bracket, the instrument being 10 inches long. This microphone, in connection with our No. 7 or 8 Receiver and No. 16 Ringer Box, will constitute a complete telephone outfit, good to speak 50 miles or more, at a remarkably low price.
No. 10 Microphone and Bracket—shipping weight, 5 lbs. Price..... **$1.00**



NO. 11 REPEATING COIL (Transformer). A standard repeating coil used for telephonic work. The coil windings are encased in an iron tube 2¼ inches in diameter. There are eight terminals for the four windings to connect to and the instrument is invaluable in connection with radio work to boost up signals, audion work, etc. Many interesting uses will be found for this coil. Resistances are: 100, 120, 145, 175 ohms.
No. 11 Repeating Coil—shipping weight, 8 lbs. Price..... **$2.00**

NO. 12 POLARIZED RINGER with Bells. The resistance of the two coils is 1250 ohms each. The armature is perfectly adjustable. Bell will work on any magneto. We also furnish blue print with ringer showing how *a first class polarized relay* can be made by anyone using only a few pieces of metal and screws.
No. 12 Polarized Ringer with Bells—shipping weight, 2 lbs. Price..... **$1.50**

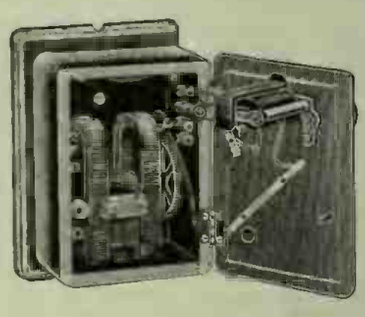
NO. 13 POLARIZED RINGER with Bells. This is the same kind of ringer as the No. 12, except that it is not adjustable and that the resistance is less. First class in all respects. Blue print furnished with this to *make polarized relay* same as with No. 12. Solenoids on this ringer are worth more than the price we ask for the entire ringer, and do not forget a powerful magnet that goes with it.
No. 13 Polarized Ringer with Bells—shipping weight, 2 lbs. Price..... **$1.00**

NO. 14 HARMONIC RINGER. This ringer is also polarized and has a powerful magnet. It works on 66.6 cycles and any magneto will operate it if run at a certain speed. A very finely built instrument. Resistance of each coil being 200 ohms. Can be converted into a polarized relay by substituting a very fine leaf spring inside the heavy one furnished. A most interesting instrument with which to experiment.
No. 14 Harmonic Ringer — shipping weight, 4 lbs. Price..... **$1.60**

NO. 15 RINGER without Bells—630 ohms. This also is a polarized ringer and has an adjustable armature. The adjustment is done by means of the top screw. A beautiful little instrument. With this instrument, too, we furnish a blue print showing how a *polarized relay can be built*. You should have several of these beautiful little instruments. They are worth their weight in gold; the powerful magnet alone being worth more than the price we ask for the entire instrument.
No. 15 Ringer—shipping weight, 2 lbs. Price..... **$0.80**

No. 55 5-bar magneto, 110 Volt A. C. Generator

This is one of the most powerful magnetos ever built, when manufacturers could afford to put good stuff into them; equipt with transmission, make and break, etc. Transmission wheels are all brass, crank handle furnished. This magneto, as well as the other ones listed below, will light a 110-volt lamp merely by turning the crank handle slowly. While this magneto gives alternating current only, it can be rewound so it will light up a number of four, six and 10-volt lamps, all depending upon the thickness of the wire you wind on the armature. As we furnish these magnetos, they will give a powerful alternating current and you will not be able to stand the current when grasping hold of the terminals. This makes an ideal shocking machine. All our generators can be transformed into a direct current machine by equipping it with a home-made commutator. Machines are A-1 in all respects and every experimenter should have one of them in his shop. Many other experiments which can be performed with this machine will readily suggest themselves to any experimenter. The magnets furnished with these generators are very powerful, each one being able to lift one pound easily.



NO. 55 5-BAR MAGNETO GENERATOR as described—shipping weight, 25 lbs. Price..... **$4.00**

NO. 33 3-BAR GENERATOR. same as described above except that it has only 3 bars, and is somewhat smaller.
No. 33 3-bar Generator—shipping weight, 10 lbs. Price..... **$2.00**

NO. 44 4-BAR GENERATOR, same as No. 55 except that it has 4 bars, and is somewhat smaller.
No. 44 4-bar Generator—shipping weight, 15 lbs. Price..... **$3.00**

NO. 66 6-BAR GENERATOR, same as No. 55 except that it has one more magnet and the armature is somewhat larger and more powerful. This is the biggest type made and is extremely powerful.
No. 66 6-bar Generator—shipping weight, 30 lbs. Price.. **$4.50**

No. 16 Western Electric Ringer Box

complete with 2500 ohm polarized ringer, bells in front of cabinet. The magneto furnished is of the two-bar type, brass gear transmission to drive it, and crank on the outside of the cabinet. The cabinet is of polished oak, piano finish and if you mount our No. 10 microphone and bracket in front of the cabinet and use our No. 7 or 8 receiver, and then use a switch to break the current you have a first-class telephone outfit at a ridiculously low price. This ringer box is one of the greatest bargains that has ever been put out. Even if you do not need it for telephonic work, you should have it as the instruments themselves are worth much more money than we ask for the entire outfit.

No. 16 Western Electric Ringer Box—shipping weight, 15 lbs. Price..... **$4.50**

"The Livest Catalog in America"

Our big, new electrical cyclopedia No. 20 is waiting for you. Positively the most complete Wireless and electrical catalog in print today. 176 Big Pages, 400 illustrations, 300 instruments and apparatus, etc. Big "Treatise on Wireless Telegraphy," 20 FREE coupons for our 160-page FREE Wireless Course in 20 lessons. FREE Cyclopedia No. 20 measures 7x5¾". Weight ½ lb. Beautiful stiff covers.

My Inventions

(*Continued from page 65*)

engineers of a defect involved in the transformation by the new method, namely, the loss in the spark gap. Subsequent investigation showed that no matter what medium is employed, be it air, hydrogen, mercury vapor, oil or a stream of electrons, the efficiency is the same. It is a law very much like that governing the conversion of mechanical energy. We may drop a weight from a certain height vertically down or carry it to the lower level along any devious path, it is immaterial insofar as the amount of work is concerned. Fortunately however, this drawback is not fatal as by proper proportioning of the resonant circuits an *efficiency of 85 per cent* is attainable. Since my early announcement of the invention it has come into universal use and wrought a revolution in many departments. But a still greater future awaits it. When in 1900 I obtained powerful discharges of 100 feet and flashed a current around the globe, I was reminded of the first tiny spark I observed in my Grand Street laboratory and was thrilled by sensations akin to those I felt when I discovered the *rotating magnetic field*

Mechanical Analog of Tesla Oscillation Transformer (Tesla Coil)

This revolutionary improvement was exhibited and explained by Tesla for the first time in his lecture before the American Institute of Electrical Engineers May 20, 1891. It has made possible to generate automatically damped or undamped oscillations of any desired frequency and, what is equally important, of perfectly constant period. It has been instrumental in many great achievements and its use has become universal. The underlying principle may be briefly stated as follows: A source of electricity is made to charge a condenser and when the difference of potential at the terminals of the latter has reached a predetermined value, an air-gap is bridged, permitting the accumulated energy to be discharged through a circuit under resonant conditions, this resulting in a long series of isochronous impulses. These are either directly used or converted to any desired volume or pressure by means of a second circuit inductively linked with the first and tuned to the same. The above diagram is taken from Tesla's lecture before the Franklin Institute and National Electric Light Association in 1893 and shows more elaborate arrangements of circuits, now quite familiar, for the conversion of ordinary direct or alternating currents into high frequency oscillations by this general method. In the mechanical apparatus illustrated, an attempt is made to convey an idea of the electrical operations as closely as practicable. The reciprocating and centrifugal pumps, respectively, represent an alternating and a direct current generator. The water takes the place of the electric fluid. The cylinder with its elastically restrained piston represents the condenser. The inertia of the moving parts corresponds to the self-induction of the electric circuit and the wide ports around the cylinder, through which the fluid can escape, perform the function of the air-gap. The operation of this apparatus will now be readily understood. Suppose first that the water is admitted to the cylinder from the centrifugal pump, this corresponding to the action of a continuous current generator. As the fluid is forced into the cylinder, the piston moves upward until the ports are uncovered, when a great quantity of the fluid rushes out, suddenly reducing the pressure so that the force of the compressed spring asserts itself and sends the piston down, closing the ports, whereupon these operations are repeated in as rapid succession as it may be desired. Each time the system, comprising the piston, rod, weights and adjustable spring, receives a blow, it quivers at its own rate which is determined by the inertia of the moving parts and the pliability of the spring exactly as in the electrical system the period of the circuit is determined by the self-induction and capacity. Under the best conditions the natural period of the elastic system will be the same as that of the primarily impressed oscillations, and then the energy of the movement will be greatest. If, instead of the centrifugal, the reciprocating pump is employed, the operation is the same in principle except that the periodic impulses of the pump impose certain limitations. The best results are again obtained when synchronism is maintained between these and the natural oscillations of the system.

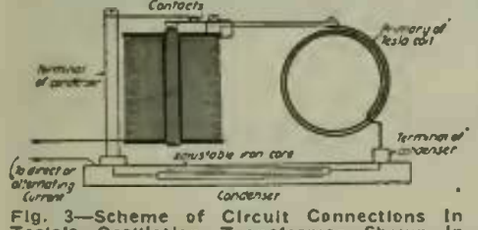

Fig. 3—Scheme of Circuit Connections In Tesla's Oscillation Transformer Shown In Fig. 1. The Secondary Circuit Which Slips Into the Primary Is Omitted.

Typewriter Sensation

FREE TRIAL

Use as You Pay

Only $4.00 a month until the low total price of $53.15 is paid, and the machine is yours.

This is absolutely the most generous typewriter offer ever made. Do not rent a machine when you can pay $4.00 a month and own one. Think of it—Buying a $100.00 machine for $53 15. Cash price, $50.35. Never before has anything like this been attempted.

Standard Visible No. 10

Smith Premier

Perfect machines, Standard size, full 84 character one motion keyboard. The entire line of writing completely visible at all times, has the tabulator, the two-color ribbon, with automatic reverse, the back spacer, ball bearing type bars, ball bearing carriage action, in fact every late style feature and modern operating convenience Comes to you with everything complete; tools, cover, operating book and instructions, ribbon, practice paper—nothing extra to buy. You cannot imagine the perfection of this beautiful reconstructed typewriter until you have seen it. I have sold several thousand of these perfect latest style Model No. 10 machines at this bargain price and every one of these thousands of satisfied customers had this beautiful, strictly up to date machine on five days' free trial before deciding to buy it. I will send it to you F. O. B. Chicago for five days' free trial. It will sell itself, but if you are not satisfied that this is the greatest typewriter you ever saw, you can return it at my expense. You won't want to return it after you try it—you cannot equal this wonderful value anywhere.

You Take No Risk—Put in Your Order *Now*

When the typewriter arrives deposit with the express agent $9.15 and take the machine for five days' trial. If you are convinced that it is the best typewriter you ever saw, keep it and send me $4.00 a month until our bargain price of $53.15 is paid. If you don't want it, return it to the express agent, receive your $9.15 and return the machine to me. I will pay the return express charges. This machine is guaranteed just as if you paid $100.00 for it. It is standard. Over one hundred thousand people own and use these typewriters and think them the best ever manufactured

The supply at this price is very limited, the price will probably be raised when my next advertisement appears, so don't delay. Fill in the coupon today—mail to me—the typewriter will be shipped promptly. There is no red tape. I employ no solicitors—no collectors—no chattel mortgage. It is simply understood that I retain title to the machine until the full $53.15 is paid. You cannot lose. It is the greatest typewriter opportunity you will ever have. Do not send me one cent. Get the coupon in the mails today—sure.

Harry A. Smith, 758, 218 N. Wells St., Chicago

H. A. SMITH, 758, 218 N. Wells St., Chicago, Ill.

Ship me a No. 10 Smith Premier F.O.B. Chicago, as described in this advertisement. I will pay you the $44.00 balance of the special $53.15 purchase price, at the rate of $4.00 per month. The title to remain in you until fully paid for. It is understood that I have five days in which to examine and try the typewriter. If I choose not to keep it I will carefully repack it and return it to the express agent. It is understood that you give the standard guarantee for one year.

SKINDERVIKEN TRANSMITTER BUTTON

Transmitting Violin Music

Fig. 1 shows how the music of a violin can be transmitted by means of the Skinderviken button. The button may be attached to any part of the violin and if it is not desired to drill a hole into the violin which may be valuable, there are numerous places where the button can be attached by means of a small nut, or if this is not desired a small lump of sealing wax into which the thread part of the button is quickly prest before it cools, will do nicely. Music can thus be transmitted from one room to another.

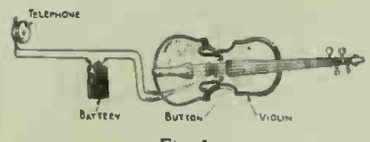

Fig. 1

Transmitting Piano Music

Fig. 2 shows how to transmit piano music at a distance. The button is attached to the front sounding board by drilling a very fine hole into the panel, or should this not be desired, it can be attached by sealing wax as described under Fig. 1. The wire can, of course, be concealed as desired. An interesting stunt can be performed by interposing a battery into the line, and the receiver shown in our diagram can then be the ordinary house telephone receiver. Piano music can then be transmitted to your friend who may be hundreds of miles distant, and the music will be absolutely clear. The same stunt can also be performed, of course, with the violin as shown in Fig. 1.

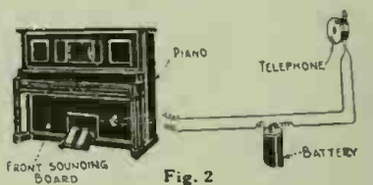

Fig. 2

A Loud Talker

Fig. 3 shows how an ordinary telephone receiver can be made into a loud talker. Very often it is desired to have a telephone conversation come in so loud that every one in the room can hear it clearly. Our illustration shows how this can be done. The telephone receiver connected to the incoming line is attached to the top of the base board as shown. The only alterations will be as follows: The cap is unscrewed and its hole is enlarged somewhat to take the Skinderviken button as shown. A thin iron nut is then attached, necessary on account of the pull exerted upon it by the telephone receiver. If the telephone receiver is a single pole type, the arrangement as shown in diagram is O. K. If a double pole receiver is used, a small iron plate instead of the nut must be used, as otherwise the pulling effect will not be so good, altho still appreciable. It is important that the nut does not touch the telephone pole piece, as otherwise the transmission will not take place. It will be necessary to underlay the diafram with a few paper washers in order to raise it sufficiently. After the Skinderviken button has been attached, it is necessary to enclose it in a sort of sound-proof box as shown in illustration. This box may be a turned wooden box, but an old telephone receiver shell will do nicely. It should be attached by means of sealing wax as shown, making it entirely sound-proof. The two transmitter wires are then connected to a loud talking receiver which may be an ordinary pony telephone receiver (single pole), which must be wound to *five ohms* or otherwise the results will not be satisfactory. By winding the receiver spool full *and evenly* with No. 26 enamel wire, you will get about five ohms. The battery between the standard receiver and the 5 ohm receiver must be ascertained by experiment, usually from four to six volts and sometimes as high as ten volts are required. It should be noted that the Skinderviken button does not easily burn out and can stand about one ampere continuously. The more battery current put on, the louder the voice. The important part now to consider is the transmitter horn, which must be made of white bristol board, the same as used on visiting cards. Buy it at any stationery store. The horn may be from 14 to 30 inches long, and the opening at the small end should be about ½ inch. It can be attached by means of sealing wax to the receiver cap. On the loud talker, the ordinary receiver diafram will do, altho one a trifle heavier works better. No magnet is used in this receiver as the pull on the diafram is electro-magnetic as well as the transmission of the voice. This device talks very loud.

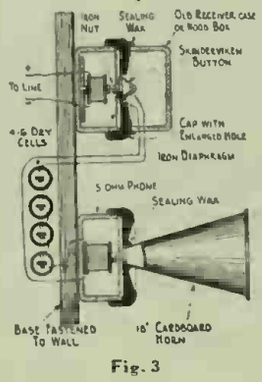

Fig. 3

How to Make a Telephone Extension

Fig. 4 shows how you can make a telephone extension to an existing telephone system. Suppose you are a telephone subscriber and you wish to have another extra phone somewhere in the building for someone else to listen in: all you need is a Skinderviken button mounted on a cigar box as shown. When the receiver is taken off the hook, it is placed on top of the cigar box directly over the transmitter button and from there the usual line runs thru a battery to the receiver. The distant party can then hear what is being said. If it is desired to have him reply also, in that case it will be necessary for him to talk into a Skinderviken transmitter and an extra line with a telephone receiver near the house phone. The party who makes the connection would then naturally have to take the receiver and place it over the mouthpiece so that the party at the other end of the wire could hear what is said. This arrangement is not shown in the diagram, but it is self-evident.

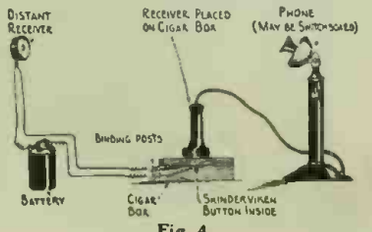

Fig. 4

"Howler," and Telegraph Practice Set

Fig. 5 shows an interesting instrument called "Howler". It is used in connection with telegraph practice instruments. It gives a loud clear musical tone every time the telegraph key is depresst. From two to three dry cells are used. The construction is somewhat similar as explained in No. 4 and the illustration is self-explanatory. The underlying idea is that the single pole telephone receiver works the Skinderviken transmitter which in turn again operates the telephone receiver, giving rise to a clear note; the same as if you take an ordinary telephone receiver of your house phone and place it over the transmitter mouthpiece, only you will find that the tone of the device described above is much better and clearer. This instrument probably constitutes one of the best and simplest learner's outfits. It can, of course, also be used as a radio test buzzer, simply by connecting one of the transmitter wires to the detector. It works very well indeed.

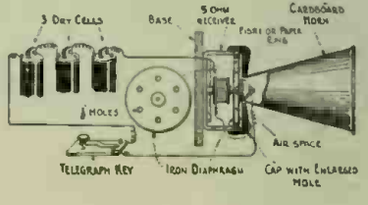

Fig. 5

SKINDERVIKEN BUTTON COMPLETE $1.00 PREPAID

Skinderviken Telephone Equipment Co. Address us as STECO, 2118-2136 N. Clark St., Chicago, Ill. or New York City, N. Y.

www.americanradiohistory.com

SKINDERVIKEN TRANSMITTER BUTTON

$1.00 ppd.

YOU can easily make a highly sensitive detectophone by using a Skinderviken Transmitter Button to collect the sound waves. You can build your own outfit without buying expensive equipment. Think of the fun you would have with such an instrument! It's very simple, too, and inexpensive.

You can install an outfit in your home and hear the conversation being held all over the house. You can connect up different rooms of a hotel. *Our outfit was used by secret service operatives during the War. It is being used on the stage.* So much for its commercial adaptations! *You* can procure apparatus of the same type.

Actual size

Fig. 3

Fig. 6

One of the main advantages of the Skinderviken Transmitter Button lies in its ultra-sensitiveness. You can place it in any position you like. It is the greatest invention in micro-phones and has won recommendations from men of high standing in the scientific world. It is being used all over the world. You can mount it most anywhere. In figures 3, 4 and 5 are shown some unusual and practical methods. Card board boxes, stove pipes, stiff calendars and hundreds of other places will suggest themselves to you. The buttons cannot be seen by any one in the room as they are so small and light. Only a small brass nut is exposed to the view.

Fig. 4

Fig. 5

BARGAINS

These prices are very low

All equipment is GUARANTEED. The apparatus is the same as sold by us to large telephona companies. 110 volt telephone generators.

3 bar	$1.75	Weight 6½	lbs.
4 bar	2.25	" 8	lbs.
5 bar	2.75	" 10	lbs.
Ringers 80 ohm	.35	" 1	lb.
" 1000 ohm	.75	" 1	lb.
Silk cords, 6 ft. 3 cond.	.20	" 3	oz.
" " 6 ft. 4 cond.	.20	" 3	oz.
" " 3 ft. 2 cond.	.10	" 1	oz.
Transmitters complete with Steco transmitter button	$1.50	12	oz.
Induction coils	.35	6	oz.

Full directions for connecting up the button for use as a detectophone are given in booklet No. 4 which is sent with each button. Figures 1 and 2 of this advertisement, two of the many illustrations in booklet No. 4, show the circuit connections of the detectophone.

The only instruments needed to complete a detectophone outfit, in addition to a Skinderviken Transmitter Button are a receiver, battery, and, if desired, an induction coil.

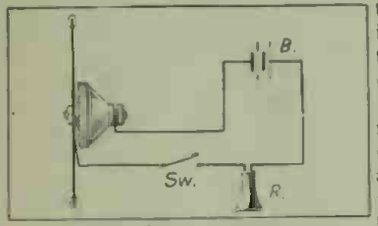

Fig. 1
Transmitter Button mounted on Diaphram. Simplest circuit.

AMONG electrical experimenters the button has created a sensation. It is not uncommon to receive unsolicited letters like these: "I received transmitter button today and I wish to inform you that it works great and is *the best I have ever seen or heard of for the price.* I will certainly recommend it to my friends. I wish to thank you for your good service."

$1.00 ppd.

"I have been using one of your transmitter buttons, and it has proved to be worth more than its value in my experimenting." "I received one (Transmitter Button) some time ago, and they are just O. K. for experimentary." "I have been using one of your transmitter buttons for experimental work and it certainly lives up to all you say for it *and then some.*"

Fig. 7

Mr. H. Gernsback, editor of this magazine, who is the dean of electrical experimenters, said: "In writer's opinion, obtained by actual elaborate tests, your Transmitter Button is probably most efficient device of its kind on market today, due to its simplicity and other outstanding features. Should have a great future."

Figures 6, 7 and 8 suggest some very interesting experiments. That of reproducing music at a point far removed from the phonograph is very popular with experimenters. The Skinderviken Transmitter Button is mounted in a very small hole in the under side of the sound arm. (Note: This hole will not injure the quality of the music.) When the phonograph is being played, the sounds produced are transformed by the Skinderviken Transmitter Button into a varying electrical current. The receiver, which is located in another room, reproduces the music at that point.

Figures 7 and 8 illustrate the methods of transmitting sound by means of the vibrations in a body while speaking. Speech will be reproduced by the receiver just the same as if the experimenter had spoken into a transmitter. In these experiments the Skinderviken Transmitter Button is mounted on a small iron disc.

Fig. 8

The same circuit connections apply to all experiments, regardless of how the transmitter button is mounted

The Skinderviken Transmitter Button operates on one or two dry cells. It often happens that two cells produce too much current and the sounds are deafening. We recommend either one fresh cell or two worn out cells.

We have the utmost faith in our transmitter button. We guarantee satisfactory service or we will refund the purchase price. Boys — Young and old—send in a dollar bill RIGHT NOW! You can't lose. If you're not satisfied, you receive your dollar back. Isn't that fair?

Send a 3c stamp for a copy of Booklet No. 4.

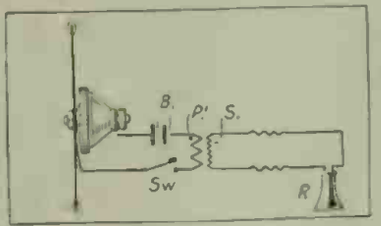

Fig. 2
Transmitter Button mounted the same but with Induction Coil.

Feb. 6, 1919.

Editor E. E.

Dear Sir:—The small ad I had in the February issue is surely bringing some great results, about six letters each day from all over the United States and Canada.

I would like to know the price of one insertion of the one-inch ad I am inclosing also cost of six insertions.

Please answer quickly.

Yours truly,

HOWELL RANG.

Exchange Ads.

For Sale—Single barrel shotgun, 110 v. Portable electric heater, Hawkins' Guides, Zeno chewing gum vending machine, and other articles. For description and prices, send three-cent stamp. Earl Brown, 514 Virginia Ave., Martinsburg, W. Va.

Wanted—Small motion picture machine for home, price about $10. Donald Porter, Frazee, Minnesota.

Sell—Motorcycle engine; telescope; chemicals; electric motor. Shank, 521 Jefferson St., Dayton, Ohio.

For Sale—1 K.W. Packard transformer, round detector and amplifier bulbs. Will buy old type General Electric Induction Fan Motor. Harry Weber, 1113 Walnut St., Dover, Ohio.

Wanted—Rifle telescope sight and Kraig rifle or carbine. A. L. Chamberlin, Box 132, Davenport, Iowa.

Bargains—Cyclopedia Applied Electricity, $15.00; Popular Science Library, $10.00; Excellent condition. First money order takes same prepaid. T. H. Blacknall, Box 107, Raleigh, North Carolina.

Sale—Regenerative Receiver, Storage Battery, other apparatus. Write for description. Thompson, 36 John St., Worcester, Mass.

For Sale—Twin Motorcycle, or engine, New Sayville Rotary spark gap, $7.00. Two Portable Wireless Sets, spark coils, wireless and electrical instruments. H. Gary, 600 Main St., Aurora, Ill.

Wanted—Smith motor wheels. Johnston, 9 Rutherford, Binghamton, N. Y.

Wanted—Small Graflex camera. A. Hofman, P. O. Box 809, City Hall Sta., N. Y.

For Sale—Wireless instruments. Vincent Natalish, 68 West 56th St., New York City.

Head Set—New Brandes distance phone—3,000 Ohm, $13.50, sell $8.00. Send stamp, large list Receiving Electrical apparatus. Dare, 94 Clinton Ave., Brooklyn, N. Y.

For Sale—Omnigraph five dials clock driven wireless code, quenched gap, polarized relay 5 ohms, stepup transformer. Will accept no less than $25 for outfit. Pastime Theatre, Union Hill, N. J.

Exchange Ads.—Continued.

Sell—Variety of articles, apparatus, etc. Write wants. Send stamped envelope. Vernon Palen, Sparta, Wisconsin.

"Multi-Audi-Fone", brand new, $15. Try this with your Audion or any detector. C. Francis, Box 1504, Providence, R. I.

Wanted—Quick! Volumes 1, 2, and 3 "Electrical Experimenter" either bound separate or any odd copies purchased. Good prices offered. Write for particulars and price to Box 70, Care Electrical Experimenter.

For Sale—Receiving set $10.85; consists of 15 and 7 inch double slider coupler, cat-whisker, detector, 14 point loading coil 17 and 3 inch. Have other wireless things. Send for list quick. George Faunce, 5 Green Street, Millville, N. J.

Cheap—Cyclopedia Applied Electricity. Stamps, Coins, junk. Howorth, University, Miss.

Exchange—Cycle-car for Smith Motor Wheel or bicycle engine or $50. Send stamp for particulars. Carl Mayo, Orleans, Mass.

Wanted—Whimshurst Static Machine. All letters answered. J. Picucci, 670 57th St., Brooklyn, N. Y.

For Sale—Shaw Motor attachment, $20. Harold Lambert, Haverstraw, N. Y.

Typewriter—Like new—For sale or exchange. John Galbreath, Rogers, Ohio.

For Sale—25 Watt Dynamo parts, $10. ½ K.W. Transformer Coil, $5. Electro Oscillation Transformer, $5. Loose Coupler, $2. Navy Receiving Transformer, $15. Blitzen Variable Condenser, $3. Murdock Variable Condenser, $3. Variable Condenser, $2. Ground Switch, $1.50. 2000 ohm phones, $2.50. Home Medical Apparatus, $3.50. Post Card Projector, $3.50. Bell Ringing Transformer, $1.50. $30 Mecanno, $20. All in good order. First draft or money order takes them. Burrows Rogers, Cainsville, Mo.

Sell or Exchange—Ford Gray & Davis Starting and Lighting system; Shaw bicycle motor attachment. Want Dynamo ½ K.W. or larger, 24 to 60 volts direct current, or screw cutting lathe 8" swing or larger. Frank Pantel, Muscatine, Iowa.

For Sale—Blueprints of motor windings, see ad under Blueprints, etc., this issue. Charles L. Chittenden, 811 West 181 St., Kansas City, Mo.

I have wireless apparatus and other things for sale. Write for list now. George Sharp, 73 Everett Ave., Providence, R. I.

Sale—Send stamp for list of wireless instruments, all bargains. Geo. Sprouls, 5624 Palethorpe St., Philadelphia, Pa.

Sell—New $50 Phonograph, $25. C. Gillespie, 72 Woodward, Buffalo, N. Y.

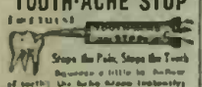
GREATEST TOY SENSATION OF THE DAY!
FIGHTING DREADNAUGHT
SENSATIONALLY REALISTIC!!!

Here is a model of Uncle Sam's fighting monsters. Eight big guns, each of which flashes, at correct intervals, from twelve to twenty times. Extra ammunition always obtainable. Absolutely harmless. Can be operated indoors or out. Now before leaving your chair to go to battle—bid to action, engage the enemy—and finally SINK the ship and command the fleet yourself by having two or more battleships, you can stage EXCITING NAVAL BATTLES in your own home. Price complete for 2 ships and ammunition, 15c, the set for 4 ships, 25c, a fleet of 8 ships for $1.50 postpaid. Extra Ammunition, 8 cents per box.



TOOTH-ACHE STOP

Stops the Pain, Stops the Tooth

Squeeze a little in hollow of tooth; the tube does instantly the pain is done, forming an obtundent filling. Accompanying harmless. Have it ready for the next bad attack. 25c per tube, postpaid.

"SAFETY 1st" PINS

A clever novelty. The National Safety First Movement is made them very popular. Buy some and show your sympathy with the movement. Also useful for sewing at amateur theatricals and the like. Sent by mail, 3 for 10c, 6 for 15c, 12 for 25c, postpaid.

Mysterious Ghost

This is not a pretty sight but dare to face it if you can. Place the ghost in a dark room and it will appear to float about in the air. Lots of fun on your mother-in-law. Price only 15 cents postpaid, or three for 40 cents.

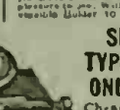
INKLESS PEN

WRITES with WATER and needs no dipping. Makes its own ink. Fashionable sweet color. Better and cheaper than fountain pens. Writes just better with one dip in plain water. No trouble, no bother, no expense. Presents for all. With Nickel Plated Holder 10 cents. 5 for 35c. Gold plated and fine inch plated, by mail, two for 10c p. pd.

SIMPLEX TYPEWRITER ONLY $2.50

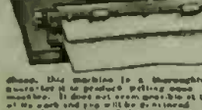
Cheap But Good. So Simple a Child Can Use It. We Guarantee the Writing.

Though an astronomically cheap, this machine is a thoroughly practical Typewriter. We guarantee it not to produce a poorer piece of work than the $1,000 machine. It does not seem possible at the price, but all we need say is see one of the cards and you will be convinced. With the exception of a few parts, it is an exact duplicate of a world beat machine in two directions, and as long a practice will make you an expert operator. It can't be otherwise. It tells you when about here a typewriter ought to be. Think what it means! Here's a typewriter that is a typewriter and not a toy! The Practical typewriter for every department in every business or professional, and to get it, as to its correspondence of any business or professional, and to get it now. You should not miss this chance of securing a Bargain. The letters are of the finest and most perfect kind, and are arranged that the letters most used are before the operator most of the time, making him to write rapidly. The writing is visible as the writing and at the end of each line a slight turn of the roller moves the carriage which makes it work and forces the paper forward, giving the printer the space for the next line. For each other to be desirable to have a writing. Each typewriter packed in a strong box with full printed instructions for use. You cannot be a typist unless you have one. Send by mail, postpaid. Price complete, $2.50.



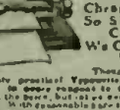
Johnson Smith & Co., Dept. E 7, 3224 N. Halsted St., Chicago

SQUIRT RING



You may have a lot of fun with the Sparkling Rose Squirt Ring. It consists of a handsome gold plated ring, attached to a rubber bulb, so arranged that the latter is quite out of view when the ring is in the proper position. Both are attractive. Unless you are the closest fellow to be the center of attraction, don't be alarmed if you are invited to get the ring of your own. Just squeeze the rubber bulb and the wearer of the ring will be showered with a spray of water. Price 30 cents, postpaid. Extra bulbs, 5 cents each.

Wonderful X-Ray Tube



A wonderful little instrument producing optical illusions both startling and interesting. With it you can see what is apparent in the bones of your fingers, the inside of a lead pencil, the inside of a watch, seeing in a nice glass, and many other amusing illusions. A perfect representation of the human skeleton is obtained instantly explained. Price 10 cents, 3 for 25 cents, 1 dozen, 75 cents. Sent by mail, postpaid.

Sneezing Powder

Place a very small amount of this powder on the back of your hand and blow it into the face of anyone in the vicinity of the victim. The effect will be startling without leaving the remotest trace. It is most amusing to hear those who, as they never suspect the real cause, but think they've caught it from some other. Sneezing, coughing and sneezing run rampant will be having the time of your life. For parties, public gatherings, and meetings, are fine, as any place at all where there is a gathering of people. It is the greatest joke out. Price 12c per box; 3 for 30c. *By Express Only.*

STAGE MONEY

With a bunch of these bills, it is easy for one person of limited means to appear prosperous. By handing a small bill to the proper time and peel off of a genuine bill or two from the outside of the roll, the effect created will be found to be all that is desired. Prices, postpaid: 15 Bills 10c, 50 Bills 25c, 125 Bills 50c, or $3.00 thousand.

NEW BOOK ON ROPE SPLICING

USEFUL KNOTS, HITCHES, SPLICES, ETC.

Neo Different Knots Are Made and What They Are Used for. Knots to Add Knots to Avoid.

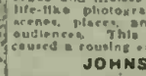
Boys, you can have Movies of your own home with this latest model
MOVING PICTURE MACHINE

Uses Standard Films same as the larger machines. Very easily managed. Simply turn the handle. Good Variety of Films always obtainable.

PRICE Complete ONLY **$2.50** Postpaid anywhere including Two Films

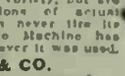
Extra Films, 15c each postpaid

THIS IS A GENUINE MOVING PICTURE MACHINE and the motion pictures are clear, sharp and distinct. The Moving Picture Machine is finely constructed, and carefully put together by skilled workmen. It is made of Russian Metal, has a beautiful finish, and is operated by a finely constructed mechanism. The projecting lenses are carefully ground and adjusted, triple polished, standard double extra reflector, throwing a ray of light many feet, and enlarging the picture on the screen up in three or four feet in area. The light is produced by a safety carbide generator, such as is used on the largest automobiles. This throws a dazzling white light on the screen.



It is a solidly constructed and durable Moving Picture Machine. The mechanism is exceedingly simple and is readily operated by the most inexperienced. The pictures shown by this marvelous Moving Picture Machine are not the common, crude and lifeless Magic Lantern variety, but are life-like photographic reproductions of actual scenes, places, and people which never tire its audiences. This Moving Picture Machine has caused a rousing enthusiasm wherever it was used.

JOHNSON SMITH & CO.

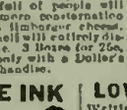


Dept. E 7 3224 N. HALSTED ST., CHICAGO

ANARCHIST BOMBS

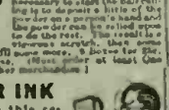
Capsule of a little glass vial, containing a liquid from a chemical which will produce a most horrible odor. One dropped in a room full of people will cause more consternation than a flamboyant shout. The smell will entirely disappear in a short time. 3 Bombs for 25c, shipped by express only with a Dollar's worth of other merchandise.

ITCHING POWDER



This is another good practical joke; the intense discomfort of your victims in scratching themselves is thoroughly enjoyable. All that is necessary to start the ball rolling is to deposit a little of the powder on a person's hand and the powder can be relied upon to do the rest. The result is vigorous scratch, then some more scratch, and still more scratch. More and more, and still more scratch. More and more, and still more scratch. 5 cents per box by mail postpaid to any address. Five packages for 20 cents. By express only, 50 cents per hundred. Dollar's worth of other merchandise.

INVISIBLE INK



The most confidential message can be written with this ink, and no one will be the wiser. Cannot be seen unless you know the secret, invisible for any length of time. Keep your business and other private matters from prying eyes. Great fun for playing practical jokes. Only 15c a bottle.

LOVE LETTER INK

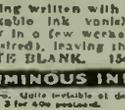
Writing written with this remarkable ink vanishes entirely in a few seconds if desired, leaving the paper QUITE BLANK. 15c p. pd.

LUMINOUS INK

Writing can be READ ONLY IN A DARK ROOM. Quite invisible at daytime. Very remarkable. 15c bottle; 3 for 40c postpaid.

JOHNSON SMITH & CO.

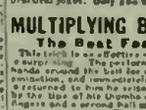
MULTIPLYING BILLIARD BALLS



The Best Feat of Its Kind

This trick is so effective as to be surprising. The performer holds forward his hand for examination, and immediately it is returned to him he proceeds to roll the balls off his thumbs and fingers and a strong ball magnetic appears. The balls are held in the palm of the hand in full view of the audience by the tips of the fingers of the left hand, and even while being placed in position, another self engages partially removes the appearance. Finally the magician apparently pulls it from some hid and yet another ball is the result. The feat can then be repeated, the balls disappearing one after another until none remains. It is a very interesting trick that is quite easily performed by following the directions that accompany the apparatus. Price complete, 25 cents, postpaid. JOHNSON SMITH & CO.

GOOD LUCK RING



Gold and Green Onyx

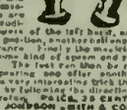
A VERY striking and uncommon ring. Made of a combination of gold and cross-bones design. Silver cross-bones flash as some sparkling gem of the ocean. A never failing object of interest. Can be used in many to bring Good Luck to the wearer. Remember the name Good Luck Ring, and what it will do. Unconditionally guaranteed to be satisfactory in every respect or money refunded. Price, postpaid, 25 cents.

LOADED CIGARETTES

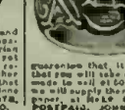
Just Like Genuine Cigarettes. Get Laid Real Interest

A box containing ten apparently genuine Cigarettes. They resemble a real cigarette in appearance and are filled to smoking. They appear so real, and afford as good a smoke before they tell that the victim is taken entirely by surprise. A most practical joke. Price per box, postpaid, 10 cents. Johnson Smith & Co., Dept. E-7

THE "LITTLE GIANT" TYPEWRITER



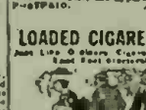
A First Class Writing Machine For $1.25



A per cent little typewriter for $1.25. There are a few things you must know before you can do a typewriter like those needle and beak-nosed do not represent the cost of the machine. The machine is too cheap to be purchased. No such purchase we can confidently recommend our Little Giant. It is strongly made, but simple in construction, so that any one can quickly learn to operate it, and the work is done with pen and ink. The letters of the alphabet most frequently used being so grouped as to enable one to write rapidly, the numerals, 1 to 10, and the characters being together. With this machine you can send your best girl (provided she has letters), address envelopes, make out bills, and do almost any kind of work requiring a large or expensive machine. With each typewriter we send a tube of ink and full printed instructions for using the machine. Price complete $1.25 by mail postpaid.

SERPENT'S EGGS

Each box contains 12 Eggs, which are no larger than a grain of oats. When lit with a match, however, each one gradually hatches itself into a Snake several feet long, which curls and twists about in a most lifelike manner. Price per box 10c, postpaid. Johnson Smith & Co.



MYSTIC SKELETON

A jointed figure of a skeleton 14 inches in height, will dance to music and perform various gymnastic and amusements while in operation may be any distance from it. The figure may be controlled by the spectators. When hanged back to the operator it is simply placed on a chair or table, when it will perform the same motions with ease and grace. At the command of the operator it will bow, make up, dance, &c. We send each with each skeleton, by the aid of which anyone can readily make it perform. 10c postpaid.

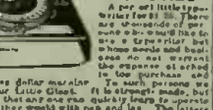
CIGARETTE ROLLER

Very neat and handy. Weighs less than a quarter of an ounce. It makes better cigarettes than you can buy for a dollar. You can use just the tobacco you prefer and thus have nicer smoke than ready made, and more of them besides saving half of your money. Just try one and make your cigarettes just to your own liking. Price only 10c or 3 for 25c postpaid, with roll instructions for use. JOHNSON SMITH & CO.

MIDGET ILLUSTRATED BIBLE

A Great Curiosity

The Smallest Bible in the World

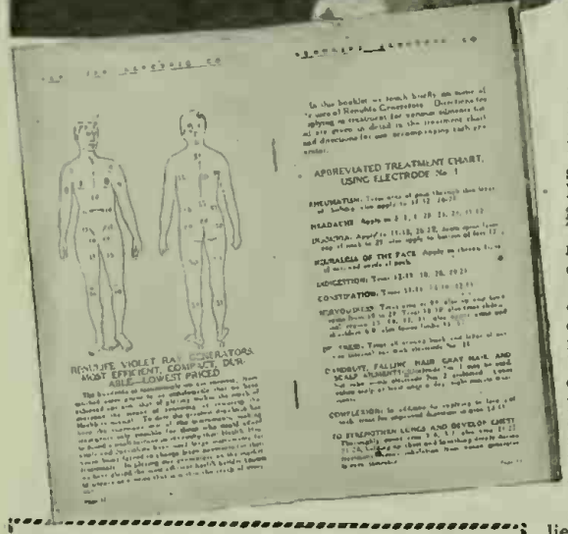


The Midget Bible is a perfect reproduction of a work of art. It is about the size of an ordinary stamp, and contains only FORTY-TWO AND FIFTY PAGES of the NEW TESTAMENT, profusely illustrated. The Bible is a wonder. Can be sold to bring good luck to the owner. Must be seen to be appreciated. Price, only 12 cents. Three Bibles for 30 cents, and we will send you 100 for $6.00. Good money can be made selling these Midget Bibles among your friends, churches, Sunday schools, bazaars, etc. Send for a few and try it.

The CONJURER'S CASKET

Apparatus and Directions for a Number of Mysterious Tricks Enough for an Entire Evening's Entertainment

ANYONE CAN DO THEM 50c



It is great fun mystifying your friends. Get this Conjurer's Cabinet, and you will be the interested fellow in your district. It contains the apparatus for a number of tricks, including The Disappearing Rose, that, when placed on the lapel of your coat, vanishes from sight at will; the Magic Vase and Ball Trick in Wooden Ball is placed inside, and upon replacing the lid has disappeared and is found in someone else's pocket; The Magic Wand with which you can perform all your finger almost at will; the Wonderful Card Trick in card is placed in an envelope, and when opened an entirely different card and altogether is found; The Disappearing Lump Trick a coin is placed in the hole wooden barrel, and when opened again, is found to have vanished without a trace; the Coin and Handkerchief Trick, in which a coin is made to change into a coin of another denomination; The Famous Mesmerized Penny that defies the law of gravitation, and sticks to the back of the hand, fingers, wall, clothing, etc.; The Glass Goblet and Vanishing Coin Trick a coin is dropped into a glass of water, and when the water is poured out the coin has vanished; Wand Trick, by means of which a borrowed coin can be

Now made simple and perfectly safe

TREAT YOURSELF With The Wonderful *Health Restorer* VIOLET RAY

You Can Have Bodily Vigor, Success-Attaining Energy, Attractive, Healthful Beauty

All at practically no cost—The great benefits of the *Violet Ray treatments* heretofore only procurable at big expense from physicians and beauty specialists are now available in your own home. Look over list of treatments below. Send for particulars.

How Violet Ray Benefits

Electricity from your light socket is transformed into health and beauty-giving Violet Ray—powerfully effective, yet gentle, soothing, perfectly safe. Voltage is raised from ordinary lighting current to *thousands of volts*, giving tremendous penetrative force. The irresistible, revitalizing powers of *Renulife Violet Ray* are carried at once to every nerve cell, fibre and part of body. Blood is enriched and purified by a flood of oxygen, giving added vitality and strength. Assimilation and digestion improved—functions restored to normal—extra supply of fresh blood quickly brought to area treated, removing congestion and supplying nourishment. While relieving pains and aches, the manifest results of disorders, it removes the deep-seated cause; combines the benefits of electricity, vibration, exercise, stimulation and oxidation.

Painless Electricity

Science has modified electricity that the weakest may stand its force without fear or pain. Every tissue and fibre is saturated, patient experiencing only a sensation of relief, as if standing in a ray of sunshine. *Violet Ray high frequency* has no comparison with old, crude, electrical batteries and shocking current. Every jar and shock is removed. The effects are marvelously rapid. Relief can be given in one or more treatments. Often cures are accomplished in that time. It is positive and certain in action. If you value your health, and want to keep or restore your good looks and gain vitality, throw away medicine bottles—take this sensible, scientific means. *Violet Rays* work with nature. Every day's delay makes relief more difficult.

Flexible Covers — Handy Pocket-Size Volumes

10 Volumes — 3500 Pages — 4700 Pictures

$1 Per Volume

$1 Per Month

Just what you need to know to succeed in ELECTRICITY

EVERY electrician, every engineer, every mechanic should know about these wonderfully helpful instructive books, which give in plain words a complete working knowledge of electrical engineering in all its phases.

You run into some new electrical problem almost every day. The information you need to help you in your every day work is in

HAWKINS ELECTRICAL GUIDES

These books place electricity at your finger ends. They cover every imaginable subject, principle, theory, problem, trouble, and way of doing things electrically. Every subject is indexed so that you can turn right to it. They are a study course and a reference guide in one, written in plain every day language—no wasted words—only what you need to know—chock full of up-to-the-minute electrical knowledge. The guides are a complete course in electrical engineering. They will help you in every detail of the day's electrical work. You can't ask an electrical question that Hawkins Guides can't answer.

What Electrical Men Say

Helped Him Make Good

"It is only right for me to recommend highly the Hawkins Guides, for they have been of the greatest assistance to me in placing me in my present position as Superintendent of Construction Department of one of Ohio's largest Electrical Companies. I would like to see every man have a set of Hawkins Guides."
Geo. Knecht, Columbus, Ohio.

In the Naval Electrical Dept.

"The Hawkins Guides are great help to me in the Naval Electrical Department, which they cover very thoroughly." C. J. Cornell, U. S. Receiving Ship, Brooklyn, N. Y.

Superintendent

"I am now superintendent of the Dunnville Hydro-Electric Systems, and Hawkins Guides were a great help to me in holding down a responsible position."
W. E. Swartz, Dunnville, Ontario.

Wireless Operators

"I have worked wireless for ten years—but I wish I had these books years ago, as they have saved me a great deal of trouble." H. Marshall, Steamer M & B No. 2, Walkerville, Ont.

Pocket-Size Flexible Covers

The books are small enough to slip into your coat pocket—handsomely bound in flexible black covers.

You can carry each volume with you until you have mastered its contents. 3,500 pages of actual information and 4,700 illustrations. Once you see these books and put them into actual use you will never again want to be without them. Try it at our expense.

SEND NO MONEY

It will cost you nothing to receive these books—to look them over—ask them all the questions you can think of—use them in your work—study them—pick up some information that will increase your earning ability. We will ship you the entire set of 10 volumes entirely FREE. This is a sign of our confidence in the guides. Pure gold does not object to being tested. Keep them for seven days and if you do not decide that you can't get along without them, return them to us and owe us nothing.

When you decide to keep them you only have to pay $1.00 down and remit the balance of $9.00 on the easy payment of $1.00 a month till paid for.

Use this coupon to get the books. It will pay you many times over.

These Are The Hours That Count

MOST of your time is mortgaged to work, meals and sleep. But the hours after supper are *yours*, and your whole future depends on how you spend them. You can fritter them away on profitless pleasure, or you can make those hours bring you position, money, power, *real success* in life. Thousands of splendid, good-paying positions are waiting in every field of work for men *trained to fill them*. There is a big job waiting for *you*—in your present work or any line you choose. Get ready for it! You can do it without losing a minute from work or a wink of sleep, without hurrying a single meal, and with plenty of time left for recreation. You can do it in one hour after supper each night, right at home, through the International Correspondence Schools.

Yes—You Can Win Success in an Hour a Day

Hundreds of thousands have proved it. The designer of the Packard Twin Six and hundreds of other Engineers, climbed to success through I.C.S. help. The builder of the great Equitable Building, and hundreds of Architects and Contractors, won their way to the top through I.C.S. spare-time study. Many of this country's foremost Advertising and Sales Managers prepared for their present positions in spare hours under I.C.S. instruction.

For 28 years men in offices, stores, shops, factories, mines, railroads—in every line of technical and commercial work—have been winning promotion and increased salaries through the I.C.S. Over 100,000 men are getting ready *right now* in the I.C.S. way for the bigger jobs ahead.

BE A CERTIFICATED ELECTRICIAN

I WILL TRAIN YOU AT HOME

A REAL POSITION LIKE THIS—FOR YOU

The country needs thousands of trained, Certificated Electricians to fill good positions—and at big pay. It's all a matter of knowing how, and I will teach you by up-to-date, modern instruction. You can learn at home, without interfering with your regular work, by my highly successful method of *Home Instruction* in *Practical Electricity*.

Prepare NOW and be ready in a few months to earn your $46 to $100 A WEEK

Send for this Book

My book, "HOW TO BECOME AN EXPERT ELECTRICIAN," has started thousands of young men on the way to splendid success. A new edition of this has just been printed. I want every young man interested in Electricity to have a copy, and will send you one, ABSOLUTELY FREE AND PREPAID. Write me today.

How I Train My Students

As Chief Engineer of the Chicago Engineering Works I know exactly the kind of training a man needs to enable him to get and hold good positions, and to earn big pay. I have trained hundreds of men who are holding splendid electrical jobs.

I give each of my students personal attention and a complete and thorough training. I give him a SPLENDID ELECTRICAL OUTFIT FREE, and much of the training is done by actual work. When my students graduate and receive their Certificate, they are ready for a real position. But *still more*, at any time you wish you can come to our splendidly equipped Electrical Shops for special training. No other school can give you this.

A Real Opportunity for YOU

Wishing is never going to make your dreams come true. You've got to *study*—to *learn*. A man is worth possibly $2 or $3 a day from his neck down—and no more; but there is *no limit* to what he can be worth from his neck up.

A *trained mind* is what gets the big pay. It is this training that you need, and I can train you in a few months. Are you ambitious to make a real success—then send me the coupon—today.

Electrical Outfit FREE

To every student who answers this ad I am giving a Splendid Electrical Outfit of standard size Electrical Tools, Instruments, Materials, etc., *absolutely free*. Furthermore, to every Electrical Student I give a truly *valuable* surprise that I cannot explain here.

Free Employment Service

I am continually receiving requests from employers to send them trained Electrical men. I assist my students to secure good positions. I keep in touch with them for years, helping and advising them in every possible way.

Write Now—Don't Delay

Delay never got you anything. Action is what counts. Get started—and get started now. Write me, or send me the coupon, right NOW.

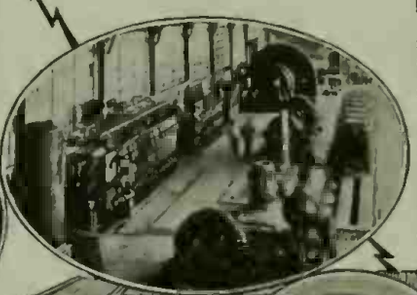
Learn ELECTRICITY as in practice

Electricity as experts know it—

RIGHT before you there is pictured a compact set of books which contains all the information you require to advance to the highest positions in the world of electricity. No instruction, no consultation by correspondence is necessary. The entire subject is before you, clearly written and clearly illustrated.

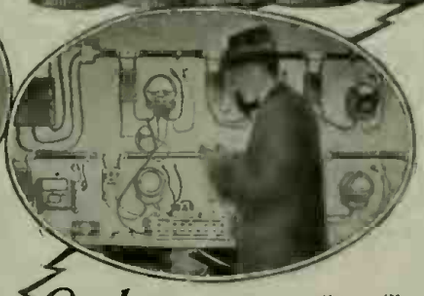


Whether you have spent years with electricity, or are a mere beginner, CROFT'S LIBRARY OF PRACTICAL ELECTRICITY will enable you to master modern practice, and fit you quickly for one of the thousands of responsible positions now open to those who are properly trained in electricity.

NOT ONE CENT IN ADVANCE

In twenty years' practice Terrell Croft has learned many things about electricity. As apprentice, as lineman, as draftsman, and finally as electrical engineer with the Westinghouse Company, he has learned the practical man's wants.

With his own practical experience, and with the co-operation of a score of other authorities, he has completed what is considered the most valuable study and reference course ever attempted.



No other set of books or course of instruction ever adhered so closely to actual work. Nothing else of the kind ever told so vividly the story of electricity as experts know it.

CROFT'S LIBRARY of PRACTICAL ELECTRICITY

8 Vols.-Flexibly bound-3000 Pages 2100 Illustrations

A SET of books which covers the wide subject of electricity completely, comprehensively and practically cannot be adequately described, therefore we extend to every reader of this paper an invitation to examine the books absolutely free.

Merely fill out the coupon below and return to us. We will ship the books, all charges prepaid, for ten days' free use. The books are pocket-size. Carry one or two with you to work, and look them over evenings. Test their usefulness by using them in connection with your work. Keep them ten full days. Then return them at our expense if you think they will not enable you to know electricity as experts know it.

Pay only $2 per month for eight months if you are thoroughly pleased.

This is your opportunity. Will you grasp it?

Only $2 per month for 8 months for a complete electrical education

McGraw-Hill Book Co., Inc.,

Tree Wireless

IN 1904, during Army maneuvers in California, General, then Major, George O. Squier, of the U. S. Signal Corps, made the important discovery that it was possible to receive radio messages, using live trees as an aërial. He found that by merely driving a metallic spike into the tree trunk, a few feet above the ground, and by connecting the wire from his radio receiving instruments to the spike, messages would come in astonishingly well over this new "aërial".

The invention, while important, received but scant notice, even in the scientific press of that day. Indeed, the majority of radio people knew very little about the invention, and those who did know considered the tree aërial as a freak, along with the bed-spring aërial and others of a similar nature.

During the war, however, the discoverer of the system, who had now become Major General Squier, Chief Signal Officer of the Army, made many new experiments with trees and radio. Recently, before the Physical Society, General Squier delivered a highly interesting lecture on the subject, and from what transpired, it is certain we have merely scratched the surface of an important invention.

General Squier, for instance, has been in constant communication with Europe for months, receiving messages from all of the large radio stations located in England, France, Italy and Germany, using nothing but trees for his aërials. But that was not all. He demonstrated that it was just as easy to *send* radio messages over a tree as it was to receive them. Indeed this holds true not only for telegraph messages, but radio telephone communication has been actually carried on between trees over a distance of *three miles!* So far no attempt has been made to increase this distance, altho it is obvious that any distance, depending only upon the power of the sending instruments, can be bridged in this manner.

That this system proved of immense value during the war can be readily imagined. Our signal corps men for that reason never were troubled with the communication lines in their rear, as long as there was a live tree about. No conspicuous wire aërial was needed for their radio work; code messages flew back and forth from the most extended points of our lines, right under the Germans' noses, who never suspected innocent-looking trees as being the carriers of priceless information.

General Squier thinks that the tree aërial will soon supplant the wire antenna entirely; even the big commercial stations, he thinks, can make excellent use of his discovery. The radio amateur particularly, will find the trees about his house a new and welcome source for his experiments. Many parents and landlords object to unsightly aërials on or about the house. An innocent-looking tree—if there is one near at hand—now solves the problem for the ambitious amateur. And the higher the tree, the better the results.

The new botanical antenna, on the other hand, brings us many new and interesting problems. One—and a curious one at that—is: How to figure the *wave length* of such an aërial! No doubt General Squier has, or will work out a standard formula for us. Undoubtedly, too, the wave length will vary from year to year—due to the growth of the tree. Then, too, in Spring, before the leaves are on the tree, the wave-length should be slightly less than in the summer time, due to the smaller area and resultant capacity. Also it would seem that in the winter time, the wave-length of the tree would be much less than in the Spring, due to the conducting sap receding from the branches.

Suppose you were to "spike up" every tree in a small wood—say, a thousand trees! The enormous area exposed to the ether, would theoretically give us a wonderfully effective antenna. We say theoretically, because we do not know how the immense added capacity would affect our instruments.

H. GERNSBACK.

The ELECTRICAL EXPERIMENTER is publisht on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. Subscription price is $2.00 a year in U. S. and possessions. Canada and foreign countries, $2.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 20 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. A green wrapper indicates expiration. No copies sent after expiration.

All communications and contributions to this journal should be address to: Editor, ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full postage has been included. ALL accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.

ELECTRICAL EXPERIMENTER, Monthly. Entered as second-class matter at the New York Post Office under Act of Congress of March 3, 1879. Title registered U. S. Patent Office.

The New Social Order

THE way is being prepared for a social order more wonderful than anything ever heretofore dreamed of; the conflict of modern science with theology; the study of comparative religions; the tremendous power of new social movements; all of these are but preparing the way for the new order.

Men, now understand that for every condition there is an adequate and definite cause, so that when a given result is desired, they seek only the cause by which this result may be obtained.

The discovery of a reign of law marked an epoch in human progress. It eliminated the element of uncertainty and caprice from the lives of men, and substituted law, reason and certitude.

These laws operate with scientific exactitude and those who have succeeded in obtaining a working knowledge of them, are enabled to break the bonds of environment; control elementary forces and utilize the potentialities of Infinity.

The Master Key tells of these wonderful Natural Laws and therefore substitutes definite principles for uncertain and hazy methods. An understanding of this scientific truth is the imperative condition, the underlying verity, the necessary precedent to every truly successful business or social relation.

Men are finding that permanent success is built upon honor, not upon dishonor; they are finding that the greatest and most penetrating mind loses its way hopelessly and can form no conception of the results of an action based upon a false premise.

The Master Key avoids theory, speculation and abstractions of all kinds. It confines itself to the operation of natural laws. These laws are clear, concise, definite and positive and can be demonstrated by any one.

The Master Key is not interested in conditions or effects, but in the cause by which the effects are produced; it is therefore limitless and has rewards hardly to be expressed in words.

All conditions are the result of the operation of this law, but unfortunately, the law will operate to our disadvantage just as readily as for our benefit and for this reason many are unconsciously creating discordant, destructive, inharmonious, poverty stricken conditions instead of conditions of health, abundance, elegance, beauty, refinement and wealth. It is simply a question of understanding; a question of knowing how to take advantage of natural laws.

If you have any objective in life, which you have not as yet succeeded in taking, or if you wish to change any condition, physical, mental, financial or environmental, or if you wish to add an asset of inestimable value to your present resources, the Master Key has a message for you.

A copy will be sent to any address without cost or obligation of any kind.

Now made simple and perfectly safe

TREAT YOURSELF With The Wonderful *Health Restorer* VIOLET RAY

You Can Have Bodily Vigor, Success-Attaining Energy, Attractive, Healthful Beauty

All at practically no cost—The great benefits of the *Violet Ray treatments* heretofore only procurable at big expense from physicians and beauty specialists are now available in your own home. Look over list of treatments below. Send for particulars.

How Violet Ray Benefits

Electricity from your light socket is transformed into health and beauty-giving Violet Ray—powerfully effective, yet gentle, soothing, perfectly safe. Voltage is raised from ordinary lighting current to *thousands of volts*, giving tremendous penetrative force. The irresistible, revitalizing powers of *Renulife Violet Ray* are carried at once to every nerve cell, fibre and part of body. Blood is enriched and purified by a flood of oxygen, giving added vitality and strength. Assimilation and digestion improved—functions restored to normal—extra supply of fresh blood quickly brought to area treated, removing congestion and supplying nourishment. While relieving pains and aches, the manifest results of disorders, it removes the deep-seated cause; combines the benefits of electricity, vibration, exercise, stimulation and oxidation.

Renulife Violet Ray
HIGH FREQUENCY GENERATORS

Painless Electricity

Science has modified electricity that the weakest may stand its force without fear or pain. Every tissue and fibre is saturated, patient experiencing only a sensation of relief, as if standing in a ray of sunshine. *Violet Ray high frequency* has no comparison with old, crude, electrical batteries and shocking current. Every jar and shock is removed. The effects are marvelously rapid. Relief can be given in one or more treatments. Often cures are accomplished in that time. It is positive and certain in action. If you value your health, and want to keep or restore your good looks and gain vitality, throw away medicine bottles—take this sensible, scientific means. *Violet Rays* work with nature. Every day's delay makes relief more difficult.

Send for Booklet, "Health via Violet Ray."

New Stomachs for Old In 48 Hours

By R. S. Thompson

EUGENE CHRISTIAN

THOUSANDS of people who suffered for years with all sorts of stomach trouble are walking around today with entirely re-made stomachs—stomachs which have been re-made in from 48 to 72 hours! They enjoy their meals and never have a thought of indigestion, constipation or any of the serious illnesses with which they formerly suffered and which are directly traceable to the stomach.

And these surprising results have been produced not by drugs or medicines of any kind, not by foregoing substantial foods, not by eating specially prepared or patented foods of any kind, but by eating the plainest, simplest foods *correctly combined!*

These facts were forcibly brought to my mind by Eugene Christian, the eminent Food Scientist, who is said to have successfully treated over 23,000 people with foods alone!

As Christian says, man is what he *eats.* What we take into our stomachs today, we are tomorrow. Food is the source of all power, yet not one person in a hundred knows the chemistry of foods as related to the chemistry of the body. The result is we are a nation of "stomach sufferers."

Christian has proved that to eat good, simple, nourishing food is not necessarily to eat correctly. In the first place, many of the foods which we have come to regard as good are in reality about the worst things we can eat, while others that we regard as harmful have the most food value.

But perhaps the greatest harm which comes from eating blindly is the fact that very often two perfectly good foods when eaten at the same meal form a chemical reaction in the stomach and literally explode, liberating dangerous toxic poisons which are absorbed by the blood and circulate throughout the system, forming the root of all or nearly all sickness, the first indications of which are acidity, fermentation, gas, constipation and many other sympathetic ills leading to most serious consequences.

And yet just as wrong food selections and combinations will destroy our health and efficiency, so will the right foods quickly create and maintain bodily vigor and mental energy. In my talk with Eugene Christian, he told me of some of his experiences in the treatment of disease through food—just a few instances out of the more than 23,000 cases he has on record.

One case which interested me greatly was that of a young business man whose efficiency had been practically wrecked through stomach acidity, fermentation and constipation, resulting in physical sluggishness which was naturally reflected in his ability to use his mind. He was twenty pounds underweight when he first went to see Christian and was so nervous he couldn't sleep. Stomach and intestinal gases were so severe that they caused irregular heart action and often fits of great mental depression. As Christian describes it, he was not 50 per cent efficient either mentally or physically. Yet in 24 hours, by following Christian's suggestions as to food, his constipation was relieved, although he had formerly been in the habit of taking large daily doses of a strong cathartic. In five weeks every abnormal symptom had disappeared—his weight having increased 6 lbs. In addition to this, he acquired a store of physical and mental energy so great in comparison with his former self as to almost belie the fact that it was the same man.

Another instance of what proper food combinations can do almost overnight was that of a man one hundred pounds overweight whose only other discomfort was rheumatism. This man's greatest pleasure in life was eating. Though convinced of the necessity, he hesitated for months to go under treatment, believing he would be deprived of the pleasures of the table. He finally, however, decided to try it out. Not only did he begin losing weight within a few hours, regaining his normal figure in a matter of weeks, but all signs of rheumatism disappearing, and he found the new diet far more delicious to the taste and afforded a much keener quality of enjoyment than his old method of eating, and wrote Christian a letter to that effect.

But perhaps the most interesting case that Christian told me of was that of a multi-millionaire—a man 70 years old, who had been traveling with his doctor for several years in a search for health. He was extremely emaciated, had chronic constipation, lumbago, and rheumatism. For over twenty years he had suffered with stomach and intestinal trouble which in reality was superaciduous secretions in the stomach. The first menus given him were designed to remove the causes of acidity, which was accomplished almost overnight. And after this was done he seemed to undergo a complete rejuvenation. His eyesight, hearing, taste, and all of his mental faculties became keener and more alert. He had had no organic trouble—but he was starving to death from malnutrition and decomposition—all caused by the wrong selection and combination of foods. Almost immediately after following Christian's advice this man could see results, and after six months he was as well and strong as he had ever been in his life.

These instances of the efficacy of right eating I have simply chosen at random from perhaps a dozen Eugene Christian told me of, every one of which was fully as interesting, and they applied to as many different ailments. Surely this man Christian is doing a great work.

I know of several instances where rich men and women have been so pleased with what he has done for them that they have sent him a check for $500 or $1,000 in addition to the amount of the bill when paying him.

There have been so many inquiries from all parts of the United States from people seeking the benefit of Eugene Christian's advice and whose cases he is unable to handle personally that he has written a little course of lessons which tells you exactly what to eat for health, strength and efficiency. This course is published by The Corrective Eating Society of New York.

These lessons, there are 24 of them, contain actual menus for breakfast, luncheon, and dinner, covering every condition of health and sickness from infancy to old age and for all occupations, climates, and seasons.

Reasons are given for every recommendation based upon actual results secured in the author's many years of practice although technical terms have been avoided. Every point is explained so clearly that there can be no possible misunderstanding.

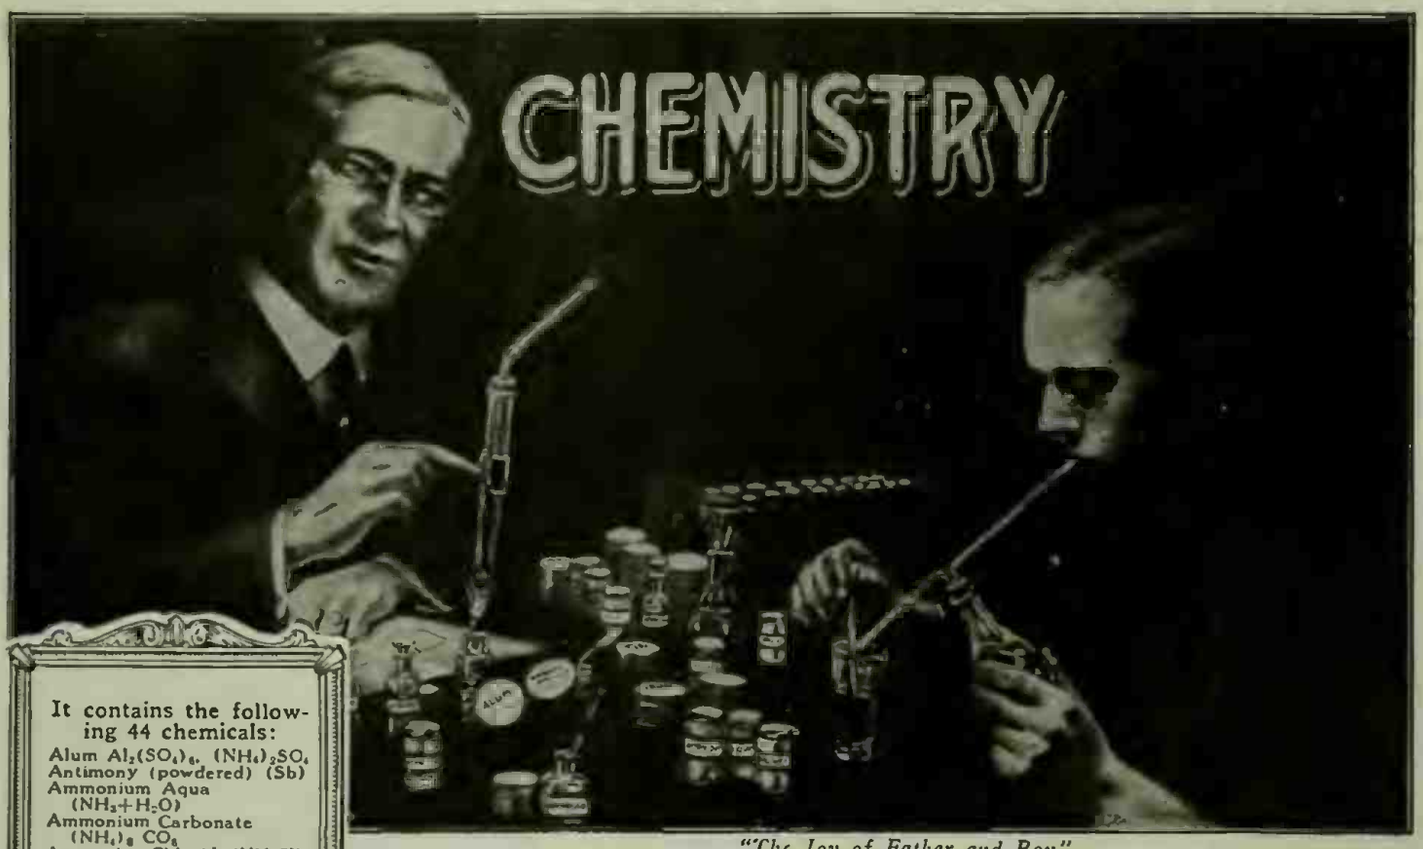
With these lessons at hand it is just as though you were in personal contact with the great food specialist, because every possible point is so thoroughly covered that you can scarcely think of a question which isn't answered. You can start eating the very things that will produce the increased physical and mental energy you are seeking the day you receive the lessons, and you will find that you secure results with the first meal. This of course, does not mean that complicated illnesses can be removed at one meal, but it does mean that real results can nearly always be seen in 48 hours or less.

If you would like to examine these 24 little Lessons in Corrective Eating, simply write The Corrective Eating Society, Department 1646, 443 Fourth Avenue, New York City. It is not necessary to enclose any money with your request. Merely ask them to send the lessons on five days' trial, with the understanding that you will either return them within that time or remit $3.00, the small fee asked.

The reasons that the Society is willing to send the lessons on free examination without money in advance is because they want to remove every obstacle to putting this knowledge in the hands of the many interested people as soon as possible, knowing full well that a test of some of the menus in the lessons themselves is more convincing than anything that can possibly be said about them.

Please clip out and mail the following form instead of writing a letter, as this is a copy of the blank adopted by the Society, and will be honored at once

CORRECTIVE EATING SOCIETY,



Dept. 1646, 443 Fourth Ave., New York City.

You may send me prepaid a copy of Corrective Eating in 24 Lessons. I will either remail them to you within five days or send you $3.

"The Joy of Father and Boy."

"ELECTRO"

Chemical Laboratory

We present herewith to our friends our new E. I. Co. Chemical Laboratory which contains real chemicals and apparata to perform real chemical experiments. This outfit is not a toy, put up merely to amuse, but a practical laboratory set, with all the chemicals, apparata and reagents necessary to perform real work and to teach the beginner all the secrets of inorganic chemistry. With this outfit we give free a book containing a Treatise in Elementary Chemistry, useful data and recipes, and 100 instructive and amusing experiments.

It contains the following 44 chemicals:

Alum $Al_2(SO_4)_6$, $(NH_4)_2SO_4$
Antimony (powdered) (Sb)
Ammonium Aqua (NH_3+H_2O)
Ammonium Carbonate $(NH_4)_2CO_3$
Ammonium Chloride (NH_4Cl)
Ammonium Sulphate $(NH_4)_2SO_4$
Barium Chloride $(BaCl_2)$
Boric Acid (H_3BO_3)
Brimstone (Sulphur) (S)
Calcium Chloride $(CaCl_2)$
Calcium Oxide (CaO)
Calcium Sulphate $(CaSO_4 2H_2O)$
Charcoal (Carbon) (C)
Chloride of Zinc $(ZnCl_2)$
Copper Sulphate $(CuSO_4)$
Ferrous Sulphate $(FeSO_4)$
Ferrous Sulphide (FeS)
Glycerol (Glycerine) $C_3H_5(OH)_3$
Hydroehloric Acid (HCl)
Iodine (I)
Iron Chloride $(FeCl_2)$
Iron Oxide (Fe_2O_3)
Lead Acetate Pb $(C_2H_3O_2)_2$
Litmus Paper
Magnesium Carbonate $(MgCO_3)$
Manganese Dioxide (MnO_2)
Mercury (Quicksilver) (Hg)
Nickel Chloride $(NiCl_2)$
Oxalic Acid $(H_2C_2O_4)$
Sodium Bicarbonate $(NaHCO_3)$
Sodium Borate $(NaBO_2)$
Sodium Carbonate (Na_2CO_3)
Sodium Chloride (NaCl)
Sodium Nitrate $(NaNO_3)$
Sodium Phosphate (Na_2HPO_4)
Sodium Sulphate (Na_2SO_4)
Sodium Sulphite (Na_2SO_3)
Stannous Chloride $(SnCl_2)$
Sulphate of Nickel $(NiSO_4)$
Sulphate of Zinc $(ZnSO_4)$
Sulphuric Acid (H_2SO_4)
Tin (Granulated) (Sn)
Zinc (Metal) (Zn)
Zinc Carbonate $(ZnCO_3)$

The following apparata are furnished:

One Standard Washbottle
One Alcohol Lamp
One Conical Glass Measure
One Erlenmeyer Flask
One Glass Funnel
One Delivery Tube
Six Assorted Test-Tubes
One Test-Tube Holder
Ten Sheets of Filter Paper
One Glass Dropper
One Spoon Measure
Glass Tubing
One book containing Treatise on Elementary Chemistry and 100 Chemical Experiments to be performed with this outfit.

DESCRIPTION OF THE OUTFIT:

The outfit consists of forty-four (44) Chemicals all C. P. (chemical pure) put up in appropriate wooden boxes, glass bottles, and hermetically closed jars. The acids are put up in glass bottles, with ground-in glass stoppers and there is a sufficient quantity of chemicals supplied (mostly one to two ounces) enough to make dozens of experiments with each. See list of Chemicals herewith.

The apparata furnished are all of the best obtainable make and of standard laboratory size and shape. A list of the 17 pieces of apparata furnished with this outfit is printed also herewith.

The Instruction book is a real **Chemistry Course for the Beginner.** Some of the Contents are: **Division of Matter:** This is a Treatise on Elementary Chemistry and deals with the theory of the Elements, Molecules and Atoms, etc. **Chemical Nomenclature.** This explains in simple language the derivation of the chemical names of the Elements and their compounds. There is a chapter on **Laboratory Operations; Glass Working; First Aid; Fire Extinguishers; Experimenters' Aphorisms,** etc.

A good part of the book is devoted to Weights and Measures. The Metric System, the English system and the U. S. System are fully explained.

The following tables are furnished: Symbols and Atomic weights of the Elements; Measures of Weights, Volume, Capacity and Length; Per Cent solutions; Conversion of Measure expressed in parts; Poisons and their antidotes; Technical and common name of chemical substances; Formulas for Cleaning various substances, etc., etc.

Among the 100 Experiments are:

How to make chemical tricks; How to make invisible and magic inks; How to test flour; How to test soil; How to Make Chlorine Gas and smoke (German War Gas); How to bleach cloth and flowers. How to produce Oxygen and Hydrogen; How to make chemical colors; How to test Acids and Alkalies and hundreds of interesting hints and formulas.

The price is still $5.00

Shipping Weight 10 lbs.

(Can be shipped by Express only.) Send your order today to:

TRADE MARK **THE ELECTRO IMPORTING CO., Mfrs.** TRADE MARK

How I Stopped Forgetting In One Evening

How in One Evening I Discovered the Secret of a Good Memory and in Six Months Increased My Business One Hundred Thousand Dollars

By William Gerard

WHO would ever have thought that a $100,000 increase in my business would come from a simple secret learned in one evening. And yet, that is just what happened. I look back on it today, and can hardly believe that it is only six short months since I learned from David M. Roth, the famous memory expert, how to make my memory do wonderful things that I never before dreamed possible.

I consider the evening I met Mr. Roth one of the most momentous in my life. It was at a dinner of the Seattle Rotary Club. Mr. Roth was present and started his exhibition by asking sixty of those present to introduce themselves to him by name. Then he requested a gentleman at the blackboard to write down names of firms, sentences and mottos on numbered squares, meanwhile sitting with his back to the writer. After this, he was asked by various Rotarians to tell what was written down in the specific squares. Mr. Roth gave the entire list without a mistake. After finishing with this, Mr. Roth singled out and called by name the sixty men to whom he had been introduced earlier, and who in the meantime had changed seats and mixed with others present.

After the meeting, I was introduced to Mr. Roth by a mutual friend, and congratulated him upon his marvelous feats of memory. To my surprise, Mr. Roth said, "Why, Mr. Gerard, such things are nothing at which to marvel. Anyone can do these things and even greater things with his memory. A good memory is not a gift. Any person of average intelligence can easily develop his memory. I, myself, am an example of this fact. As a young man my memory was so poor I could hardly remember a man's face or name 20 seconds. I soon realized that this bad memory would scare away any chance I had for success. Right then and there I determined to improve my memory. And now, after 20 years of attention to the subject, I feel that I can do as much for other people's memories as I have done for my own. I have recently finished work on a simple and practical course through which anyone can improve his memory until it becomes a veritable sponge for absorbing facts, faces, names and all the information one wants to remember. This course contains all of my secrets and principles. If you will write to my publishers in New York, the Independent Corporation, you can make arrangements for examining the course without charge."

Needless to say I wrote the Independent Corporation, asking to examine the course. In a few days I received the seven lessons together with a little booklet of letters from many men telling what they had already done through the aid of the course. It was very encouraging for me to read the letter from C. Louis Allen, who at the age of thirty-two became president of the million dollar Pyrene Manufacturing Company, and is now the president of the Sales Company bearing his name.

"Now (says Mr. Allen) that the Roth Memory Course is finished I want to tell you how much I have enjoyed the study of this most fascinating subject. Usually these courses involve a great deal of drudgery, but this has been nothing but pure pleasure all the way through. I have derived much benefit from taking the course of instruction and feel that I shall continue to strengthen my memory. That is the best part of it. I shall be glad of an opportunity to recommend your work to my friends."

You may be sure that after reading the balance of the letters telling of *real results*, I went right at the course that very evening. I expected to find the lessons "brain breakers", but to my surprise, the Roth Course was as easy and fascinating as a game. I hated to put it by that evening and surprised my wife by repeating backwards, forwards and all ways fifty words of all sorts. My wife could not understand how a person with a memory so poor as mine could do such a thing after only about one hour's study. But the course gives the secret of a good memory *right at the start.* I played the memory improving game for a few minutes each evening for a month. And the further I got the more fascinating the game became. Long before a month was up I had amazed my family and my friends on a number of occasions by various memory feats, and to them the astounding difference in my memory was nothing short of a miracle.

And now, my memory behaves so efficiently that my business has felt the impetus of my increased mind power and has responded in a joyously lucrative fashion. Within the last six months my sales have jumped up $100,000—*with no "war-baby" or external force to boost my business.*

The reason I know that my business expansion is due to my own increased power is that I seem to have a new grip upon affairs. I employ old facts and experiences, give them a new twist and have thereby revitalized my business methods. I now remember and apply all that I have heard other people have learned. Nothing slips my mind that can be used to some business advantage. I find and store in my new, iron-bound memory real nuggets of facts and experiences that other people casually let drop. When a condition arises, I just seem to open a certain drawer of my mind, then take out and marshal together all facts and precedents that I have learned. My memory has become an ally that never fails to help me push my business ahead "on high."

I now seize many golden opportunities that before would have slipped by and been out of reach by the time I woke up.

You see the Roth Course has done vastly more for me than merely teach me how to remember names and faces, telephone numbers, etc. It has done more than make me a more interesting talker. It has done more than give me confidence in myself.

Mr. Roth's Course has endowed me with new business perspective. It has made me a keener observer. It has given me a new sense of proportion and values. It has given me visualization—which after all is the true basis of business success.

I feel that I owe the Roth Memory Course a great debt—in fact, a $100,000 debt. I feel that telling my story to the readers of The Electrical Experimenter Magazine is only a small payment for what the course has done for me. Any power that can increase a man's business $100,000 and increase his mind power 90% deserves that man's sincere and truthful endorsement. I *know* that this is what the Roth Memory Course has done for me and for my business. Not alone am I happy to be able to tell my story as it happened, but I am gratified to know that anyone can do the same thing. A mere glance over the first lesson will show that there is a course, not for "high brows" who love to bathe in theory, but practical and easy instructions for every man, woman or child, who knows the enormous value of a good substantial memory. This same hand of mine that gave out $5 for the Roth Course took in $100,000 as a result, and in telling my experience, I feel that in a small way, I am repaying the great debt that I owe to the David M. Roth Memory Course.

WILLIAM GERARD.

AMAZING MEMORY FEATS

Any man, woman or child of average intelligence can easily and quickly acquire a sure and exact memory.

When David M. Roth, the famous expert, first determined to cultivate his memory he did it because he had a poor memory. He actually could not remember a man's name twenty seconds. He forgot so many things, that he knew he could not succeed unless he did learn how to remember.

Today there are over ten thousand people in the United States whom Mr. Roth has met at different times—most of them only once—whom he can name instantly on sight. Mr. Roth can, and has, hundreds of times at dinners and lectures, asked from fifty to one hundred people to tell him their names and telephone numbers, and business connections, and then, after turning his back while they changed seats, has picked each one out by name and told him his telephone number and business.

These are only a few of the scores of other equally "impossible" things that Mr. Roth does—and yet a few years ago he could not remember a man's name twenty seconds. You too can do these wonderful things.

SEND NO MONEY

So confident is the Independent Corporation, the publishers of the Roth Memory Course, that once you have an opportunity to see in your own home how easy it is to double, yes triple your memory power in a few short hours, that they are willing to send the course on free examination.

Don't send any money. Merely mail the coupon or write a letter and the complete course will be sent, all charges prepaid, at once. If you are not entirely satisfied send it back any time within five days after you receive it and you will owe nothing. On the other hand, if you are as pleased as are the thousands of other men and women who have used the course, send only $5 in full payment. You take no risk and you have everything to gain, so mail the coupon or a letter now before this remarkable offer is withdrawn.

Independent Corporation

Publishers of The Independent Weekly

Dept. R-1106 119 West 40th St., New York

Please send me the Roth Memory Course of seven lessons. I will either remail the course to you within five days after its receipt or send you $5 in full payment of the course.

Master Electricity By Actual Practice

The only way you can become an expert is by doing the very work under competent instructors, which you will be called upon to do later on. In other words, *learn by doing.* That is the method of the New York Electrical School.

Five minutes of actual practice properly directed is worth more to a man than years and years of book study. Indeed, Actual Practice is the only training of value, and graduates of New York Electrical School have proved themselves to be the only men that are fully qualified to satisfy EVERY demand of the Electrical Profession.

The Only Institution of the Kind in America

At this "Learn by Doing" School a man acquires the art of Electrical Drafting; the best business method and experience in Electrical Contracting, together with the skill to install, operate and maintain all systems for producing, transmitting and using electricity. A school for Old and Young. Individual instruction.

Over 5,500 Graduates are Successful Men in the Electrical World

No previous knowledge of electricity, mechanics or mathematics is necessary to take this electrical course. You can begin the course now and by steady application prepare yourself in a short time. You will be taught by practical electrical experts with actual apparatus, under actual conditions.

Let us explain this course to you in person. If you can't call, send now for 64-page book—it's FREE to you

New York Electrical School
29 W. 17th St., New York, N. Y.

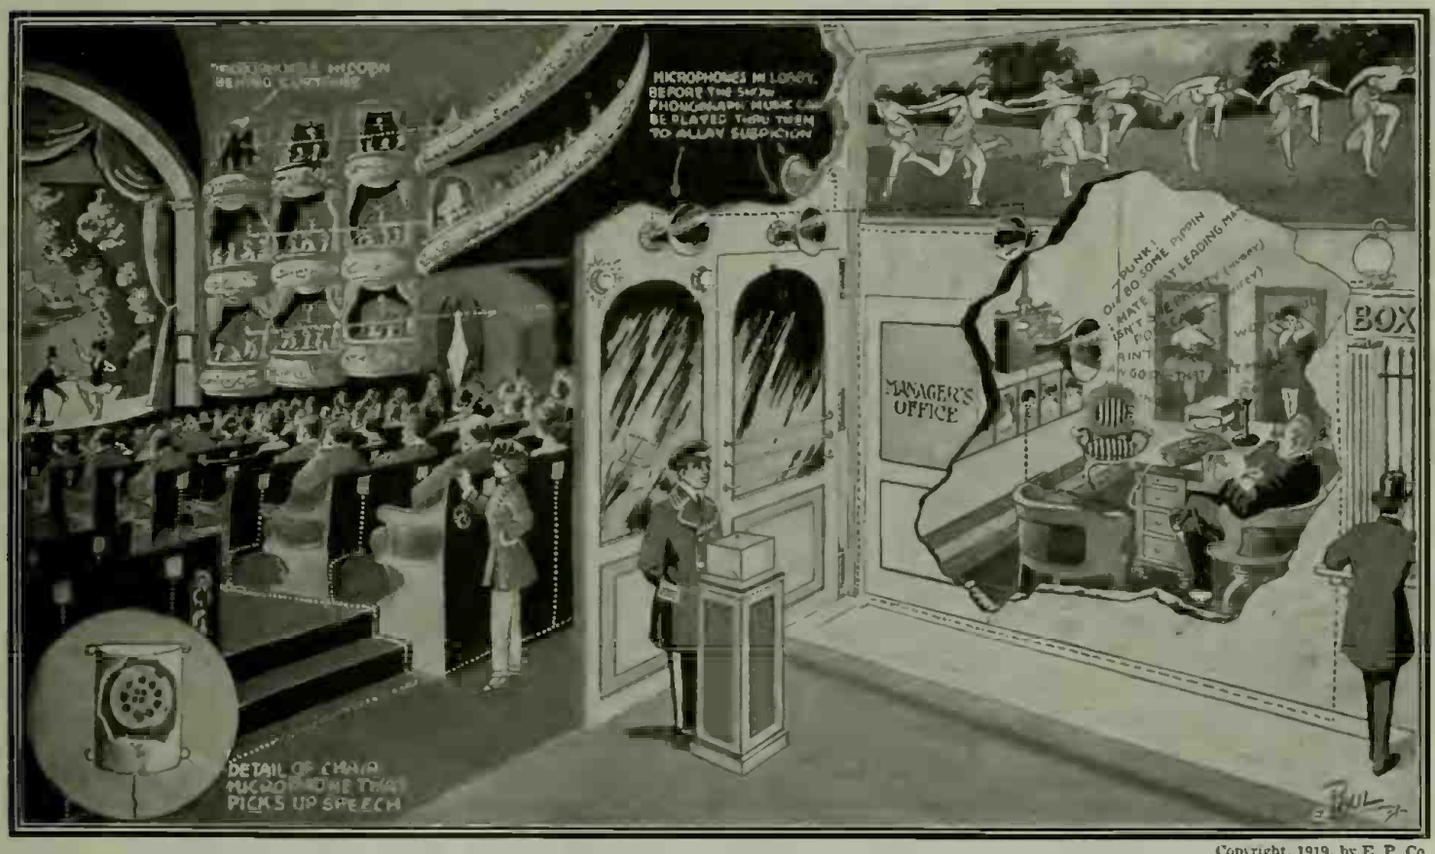
Vol. VII. Whole No. 74 JUNE, 1919 No. 2

Listening to Theater Critics



WE of the present generation have seen the dictograph or supersensitive telephone, applied to almost every purpose imaginable, from listening to the whispered machinations and plottings of criminals to the honeyed words of the philanderous husband making love to a chorus girl.

But now comes the very latest application of the dictograph, for the purpose of overhearing the criticisms of theater audiences, and it took Chicago to show us the way. In that city there is a large motion-picture theater completely equipt with dictograph transmitters or microphones, liberally sprinkled thruout the auditorium, so that the manager, by means of a small switchboard installed in his private office, may overhear the conversations, caustic or otherwise, regarding Bessy Tinkletoes and the merits and demerits of the corseted leading man, not to mention the "villiun" and the dashing, smashing "soubrette."

The *microphones* or sound-detecting apparatus, camouflaged so as to be invisible, are secured on the backs of the various chairs in the orchestra or balcony, and are connected up with separate wires leading to a switchboard in the manager's office, so that as the switch is turned, the respective microphones are switched into circuit alternately. The current modulations set up by even a whisper several feet away from one of these microphones act on a loud-speaking telephone at the manager's desk. It is also possible to connect up such apparatus with a set of head receivers strapt to the ears, the same as in the regular dictaphone sets used by crime investigators, after the fashion made famous by Detective Burns and other defenders of the common law.

Not only is it possible with such an arrangement to place microphones or sound detectors on the backs of seats in the auditorium, but they may be placed in the boxes behind portieres, and in many other advantageous and inconspicuous positions. It is rather difficult to conceal them in the foyer, but by a little clever subterfuge and ingenuity exercised by the engineers having charge of the installation, this problem is quite easily solved. For instance, an old trick of the showman may be put into play, namely, that to allay suspicion on any trick, you must convince the public that everything is apparently as it seems; and bearing in mind P. T. Barnum's famous lines—"The public likes to be fooled," and "There's one born every minute," we proceed in the present case to do a little fooling of the public ourselves, and thusly do we do it; by placing the microphones in a series of small ornamental horns about the lobby, in the bases of which there are also arranged loud-speaking telephone devices. Before the performance and during intermissions, when the foyer and lobby

Electric Drive on U. S. S. "New Mexico"

By CHARLES M. RIPLEY

THE battleship *New Mexico* is the pride of the United States Navy, and her electric drive is the pride of the *New Mexico*. How the electrical machinery looks, how it works, why the electric drive is preferable to other forms of propulsion, how she looks inside and outside, is here related by one of the men who recently was a passenger on Uncle Sam's latest superdreadnaught, riding between the Brooklyn Navy Yard and Rockland, Maine.

This latest leviathan weighs 32,000 tons and requires 32,000 horsepower or *one horsepower per ton*. Her weight is equivalent to a bar of iron weighing one pound to the foot and forming a band of iron from the North to the South Pole with enough in addition to reach from Maine almost to the borders of Florida. She is so huge that it requires ten tugs to push her from her pier in Brooklyn Navy Yard out into the East River. From the platform called the "crow's nest" at the top of the mast down to the level of the water is 120 feet, or equal in height to a ten-story building.

The battleship can generate enough electricity to run the giant General Electric Works and the Schenectady Railway Company.

Motors Drive Propellers.

Like everything else that is electrical, the *New Mexico* is the cleanest institution of her kind. There are no engines or turbines connected with the propeller shafts—only electric motors. There are no grates under the boilers—merely oil burners. There is not a coal or ash shovel on the ship; nor are there any cinders, smoke, dust, or soot.

The *New Mexico* "coals" thru a 6-in. hose, that is because she burns only oil for her power. The total oil capacity of the dozen or more compartments is 3,400 tons or 6,800,000 lbs., or nearly a million gallons. If the *New Mexico* were an automobile with a mileage of 20 miles per gallon, this amount of oil would drive her close to 20 million miles or a distance equal to 80 times to the moon. But a 32,000-ton battleship does not equal the mileage of a flivver, for it weighs as much as 60,000 of those vehicles, and must plow thru the water displacing her own weight of water each time she runs her own length, 624 feet. The cost of fuel is more important on ship board than on land, and this is emphasized by the fact that on the 2,000-mile trial trip alone she will displace over 620,000,000 tons of water.

From Oil to Electricity.

Following the energy of the oil fuel thru the different processes until this energy drives the propellers electrically is an entertaining and instructive trip. Escorted by courteous officers, you start for one of the three boiler rooms. You must open and close several steel bulkheads in the watertight compartment and descend steel ladders and steel steps apparently equivalent to those in a five-story building. On the way down you must pass thru an "air lock" similar to those which give the excavators access to the caissons used in building the foundations of the skyscrapers 90 feet under Broadway, or in constructing the piers under big bridges in the middle of the river. The officer who escorts you is very careful to close the steel door behind you before he opens the one in front of you.

High Air Pressure.

No sooner are the bolts loosened than you feel the increased air pressure swish into your ears. This is because the air in the fire-room is maintained at a higher pressure than the outside air. All the air which the firemen breathe is pumped air. There is more oxygen in a cubic foot of this air than there is in ordinary air. This increased pressure and increased oxygen are both useful in providing the proper combustion in the boiler.

How Smoke Screens Are Made.

If the *New Mexico* wishes to throw a smoke screen, the men in the fireroom merely turn a few tiny hand valves in a ¼-in. pipe and, presto! inky blackness will vomit from the single smoke stack and blacken vast sea areas. This is a very nice study of how different mechanical mixtures of oil and air will bring about different chemical combinations between oil and oxygen. One of these combinations eliminates smoke by effecting almost perfect combustion; while the other creates a heavy black smoke which will practically blindfold the enemy. And three little ¼-in. pipes in each boiler are all that is needed to do this.

THE day of the all-electric superdreadnaught, not to mention electrically driven war vessels and merchant ships of smaller size, has arrived. In the present article Mr. Ripley gives us an interesting authoritative description of his trip on Uncle Sam's latest superdreadnaught, the "New Mexico", with her 32,000 horse-power electric propelling plant. Like everything else that is electric, the "New Mexico" is the cleanest institution of her kind. There are no engines or turbines directly connected with the propelling shafts—only powerful electric motors. There are no grates under the boilers—merely oil burners. Electrical propulsion not only does away with reversing turbines, but also does away with reduction gears, with their accompanying mechanical loss. The battleship "New Mexico" can travel a distance of 7,500 knots at 12 knat speed before it will be necessary to take on more fuel. The electric equipment totals nearly 100,000 horsepower, including over 100 loud speaking telephones, nearly 200 electric fans, electric gyroscopic compasses, and in fact "Electricity" rules the day everywhere about this modern naval wonder.

Size of Boilers.

It is said that no other 32,000-ton battleship has as few as nine boilers. There are three boiler rooms, each in a separate compartment, and each room contains three large boilers. Each of these nine boilers can deliver over 4,000 horsepower and contains three miles of 2-in. seamless pipes. Put end to end the pipes in all nine boilers would make a seamless tube 27 miles long. The Pennsylvania has 12 boilers and the Oklahoma has 12, altho its tonnage is only 27,500.

The history of the steam engine shows that its inventor, James Watt, thruout his entire life opposed any steam pressure higher than 5 to 10 lbs. per square inch. The *New Mexico's* boilers supply *steam at 250 lbs. per square inch!*

Superheated Steam.

After the steam is generated, and has past thru the big pipe away from the water in the boiler, it is again brought in contact with the flames of the furnace and is superheated to a still higher temperature. In fact, as the steam leaves the boiler it is about 450° F., or hot enough to melt solder and tin.

Superheated steam gives super-results. This is because the steam turbine is class among engineers as a "heat engine" and the more heat that is supplied in this steam the more energy is available for power.

Two Power Plants.

For propulsion there are two electric power plants in separate compartments. They are way down low in the *New Mexico* close to the boilers. Each of these power plants alone is able to drive the battleship at a speed of 18 knots. (A nautical mile, or knot, is 6,080 feet, as against 5,280 feet in a land mile.)

Turbine Electric Plant.

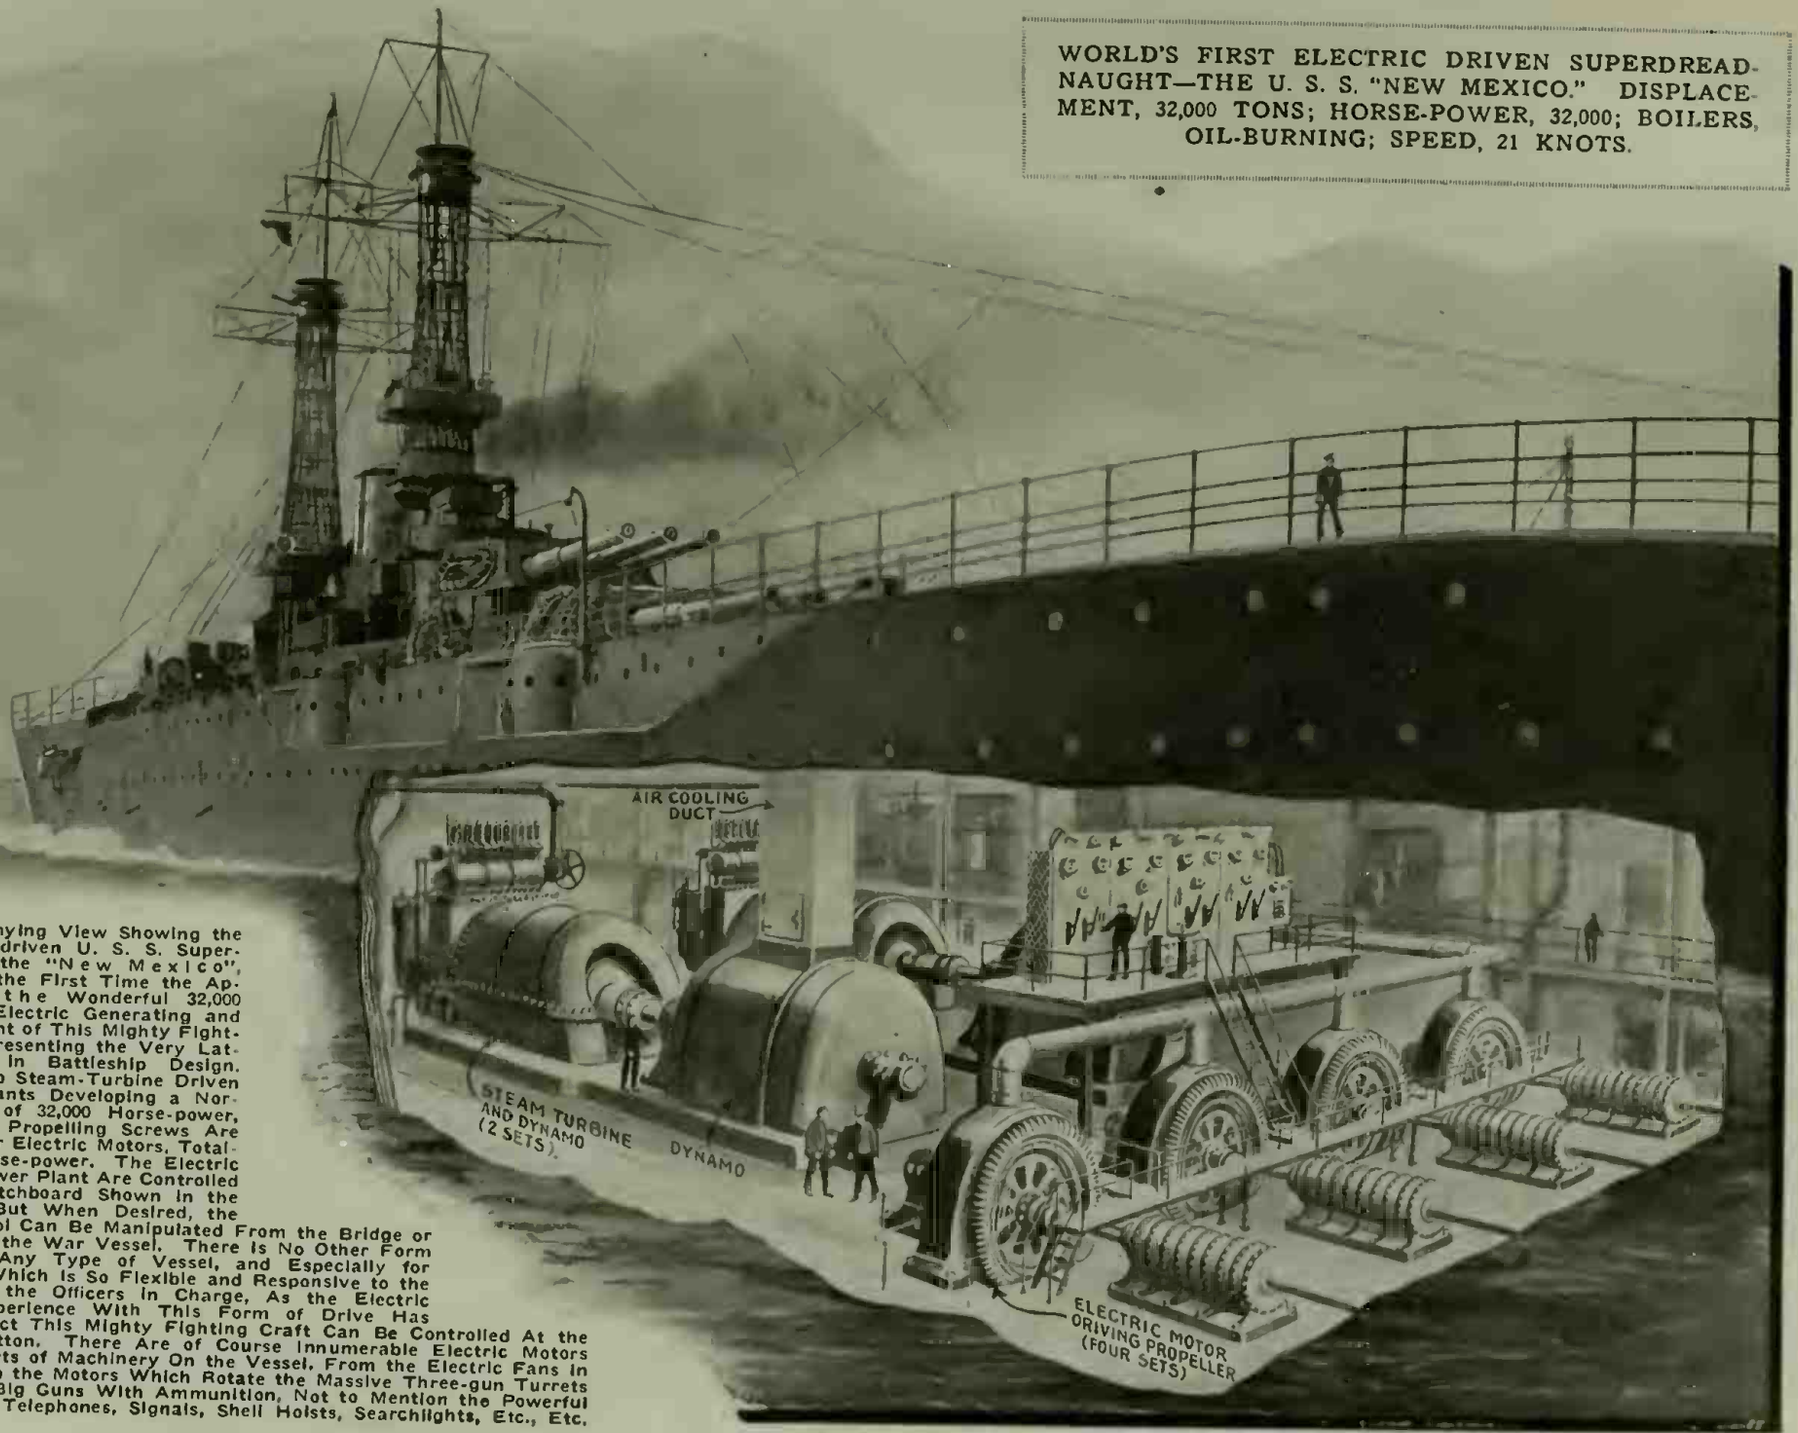
In two separate steel compartments 15 by 45 ft. are located the two turbine generator sets, each not over 27 ft. long. The turbine itself is little larger than a hogshead of molasses laid over on its side. It seems almost incredible that this small machine can generate 16,000 horsepower from steam.

The engine rooms of most ships of the past have been a tangle of bending and curving pipes, and in order to move about the men had to stoop down to go under them or climb over them or squeeze between them. When one of these pipes burst it practically meant the death of every man in the engine room. One of the advantages of these power plant rooms in the *New Mexico* is the fact that there is only one steam pipe in the room, and that is only 16 ft. long.

Steam Turbine.

In each of these two power plants the steam turbines make electricity for driving the battleship. From the outside the most interesting thing about these wonderful rotary steam engines, called turbines, is their small size, their light weight, and the fact that they are so perfectly enclosed that you cannot see anything move. A turbine of 16,000 horsepower when compared in size and weight with the great triple and quadruple expansion steam engine that had been used up until recent years, is practically a watch charm—a little toy. There is only rotary motion in the steam turbine.

Inside the casing are ten wheels arranged side by side like the coins are kept in a bank. In the rims of all of these wheels are hundreds of buckets against which the steam strikes. The steam enters at one end of the turbine and dashes against the buckets of each of these wheels, one after the other; and as it strikes against these buckets the wheels and the shaft to which they are fixt all turn around. This shaft drives the electric generator immediately adjacent, and in it the mechanical power is turned into electricity. Then eight copper wires only slightly larger than a garden hose convey the 16,000 horsepower thru the steel walls to the next compartment where the switchboard is located. Electric fans in the power plant ventilate the room and also *cool the generator*, and the heated air is pumped outside.



The Switchboards.

When the eight electric wires leave the power plant room, they go to the electric switches back of the switchboard. Here the ship is controlled upon receipt of in-

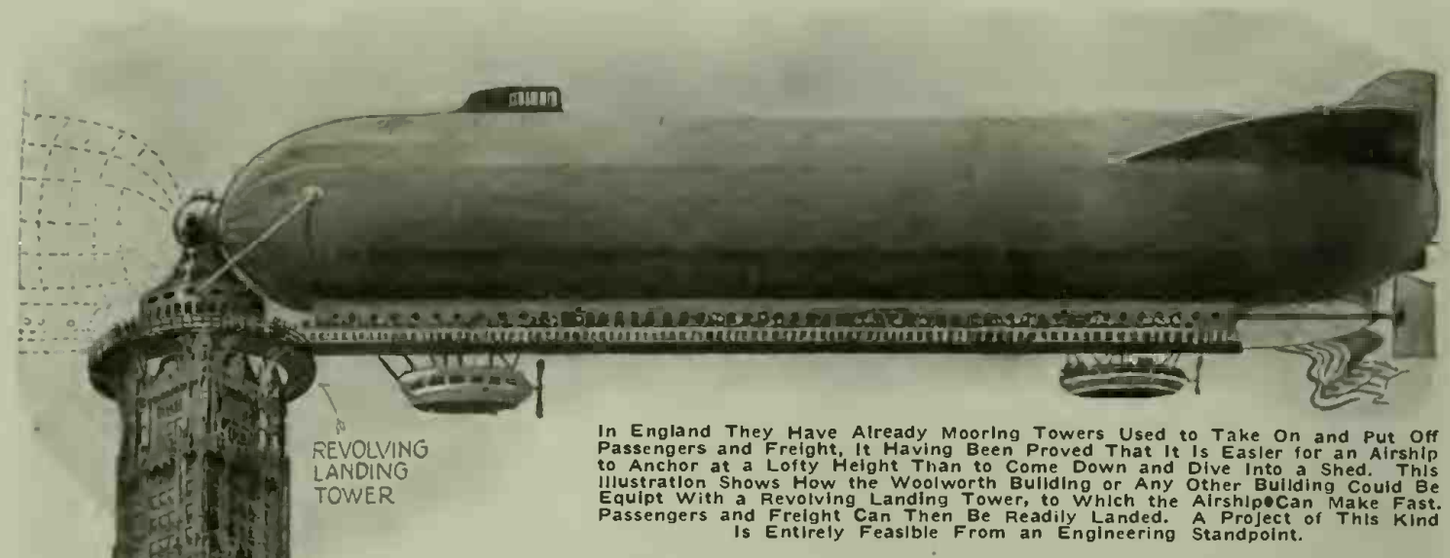
WORLD'S FIRST ELECTRIC DRIVEN SUPERDREADNAUGHT—THE U. S. S. "NEW MEXICO." DISPLACEMENT, 32,000 TONS; HORSE-POWER, 32,000; BOILERS, OIL-BURNING; SPEED, 21 KNOTS.



The Accompanying View Showing the New Electric-driven U. S. S. Superdreadnaught, the "New Mexico", Discloses for the First Time the Appearance of the Wonderful 32,000 Horse-power Electric Generating and Propelling Plant of This Mighty Fighting Ship—Representing the Very Latest Advance in Battleship Design. There Are Two Steam-Turbine Driven Generating Plants Developing a Normal Capacity of 32,000 Horse-power, and the Four Propelling Screws Are Driven by Four Electric Motors, Totaling 32,000 Horse-power. The Electric Motors and Power Plant Are Controlled From the Switchboard Shown in the Power-room, But When Desired, the Electric Control Can Be Manipulated From the Bridge or Pilot-house of the War Vessel. There Is No Other Form of Drive for Any Type of Vessel, and Especially for Battle-ships, Which Is So Flexible and Responsive to the Commands of the Officers in Charge, As the Electric Drive, As Experience With This Form of Drive Has Proven. In Fact This Mighty Fighting Craft Can Be Controlled At the Push of a Button. There Are of Course Innumerable Electric Motors Driving All Sorts of Machinery On the Vessel, From the Electric Fans in the Kitchens to the Motors Which Rotate the Massive Three-gun Turrets and Feed the Big Guns With Ammunition, Not to Mention the Powerful Radio Station, Telephones, Signals, Shell Hoists, Searchlights, Etc., Etc.

Recent Aërial Developments

By H. GERNSBACK

In England They Have Already Mooring Towers Used to Take On and Put Off Passengers and Freight, It Having Been Proved That It Is Easier for an Airship to Anchor at a Lofty Height Than to Come Down and Dive Into a Shed. This Illustration Shows How the Woolworth Building or Any Other Building Could Be Equipt With a Revolving Landing Tower, to Which the Airship Can Make Fast. Passengers and Freight Can Then Be Readily Landed. A Project of This Kind Is Entirely Feasible From an Engineering Standpoint.

WHEN the Zeppelin, that is, the rigid type of airship, first appeared it had many inherent faults. Probably the greatest one was the inflammable gas carried in the sectional ballonets.

As fast as the Zeppelins were constructed they were destroyed mostly by fire due to electric sparks, which set on fire the inflammable hydrogen gas.

Secondly, the landing arrangements as used by the Germans were very inefficient, and it was not infrequent that the huge airship became wrecked when coming down to earth prior to entering its mooring shed. In the air, the Zeppelin type is safe enough, and even the severest storms can be ridden out with comparative safety, that is, all storms except electrical storms, which not infrequently set the dirigibles on fire, due to lightning.

Recently, the English have proposed a novel manner for landing passengers, and no longer do the huge airships of the rigid type descend to earth to discharge their passengers or cargo. The device used is a sort of huge hitching post in the form of a high tower held fast by means of cables and stays. The upper part of the tower has a revolving top section with which the nose of the airship comes into contact, and to this it is made fast. The passengers and cargo leave and enter by means of this revolving top and descend or ascend to earth by means of elevators. These towers are anywhere from three to five hundred feet high, and the airship can "land" and make fast to the tower with comparative safety, as has been actually demonstrated in England.

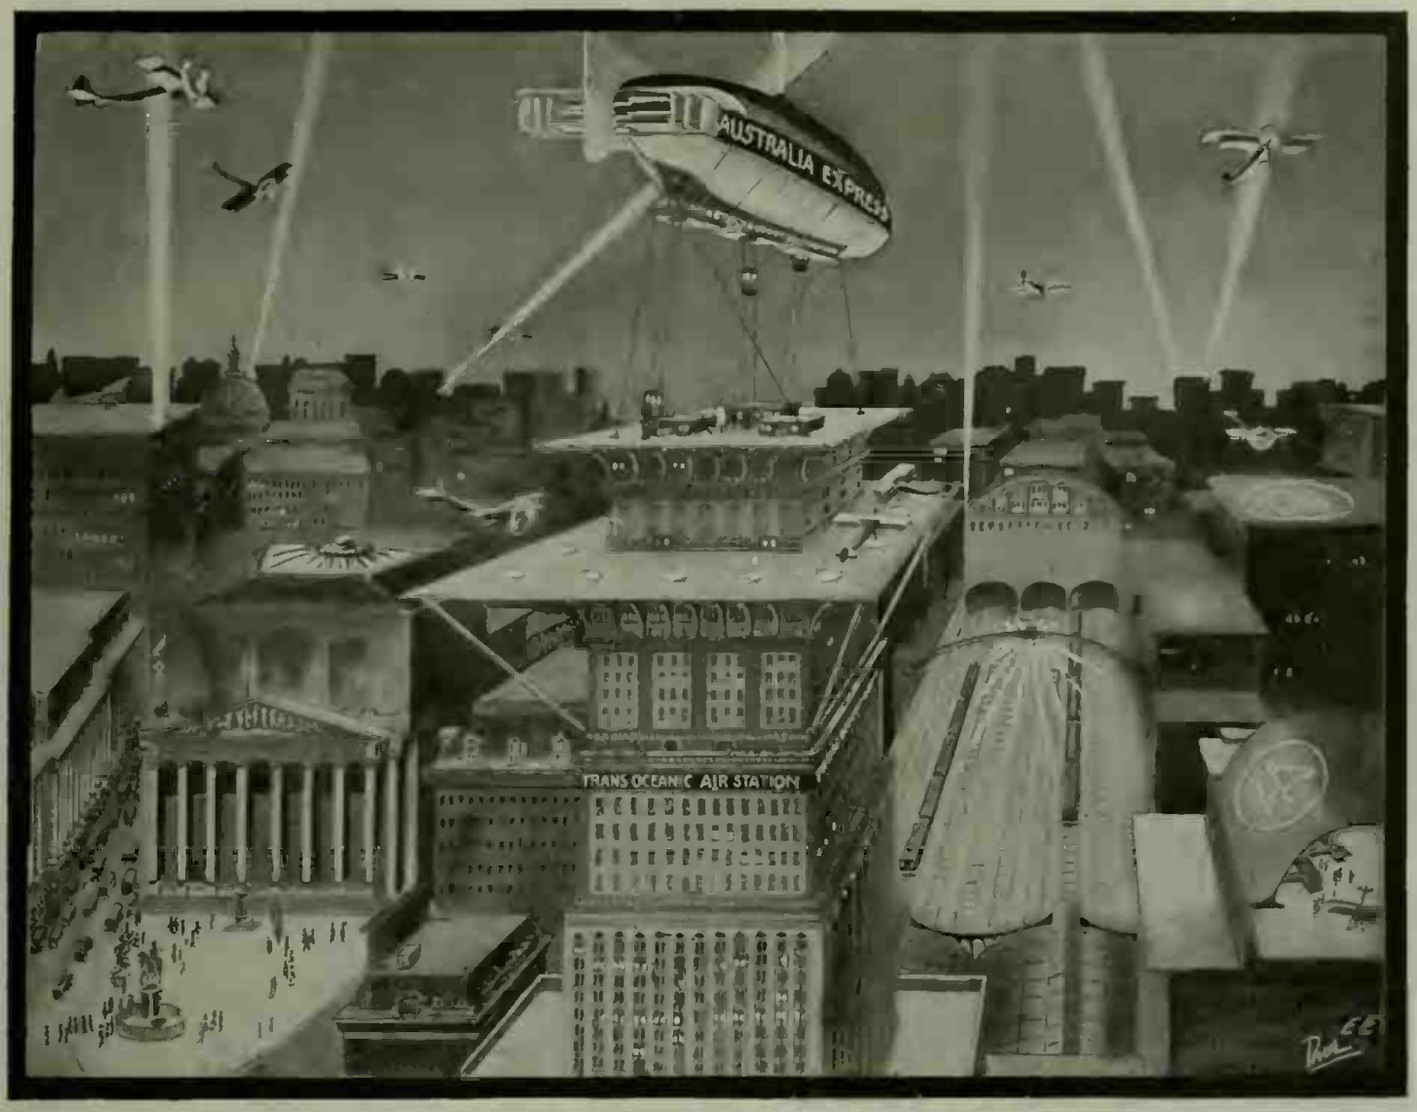
It makes no difference which way the wind blows or how hard, the airship will simply take its position, similar to a wind vane, where it offers the least resistance to the wind. It will ride out the most severe storm very readily in such a position and in comparative safety. This also has been actually demonstrated.

The fire danger is now being reduced entirely by the use of an American idea, helium gas, which has approximately the same lifting power as hydrogen, but which is absolutely non-inflammable.

It does seem that for many years to come the rigid type of airship will probably be the one destined to carry passengers and freight, while for a long time, the airplane will only act as a secondary unit, or as a feeder. In other words, the airship will be used to cover long distances, while the airplane will cover short distances, bringing passengers and freight to the central dirigible depots.

We have today airships with a capacity of 2,000,000 cubic feet of gas, and it will not be long until the 5,000,000 cubic foot gas dirigible will be in use. Aviation authorities think that such airships will be in operation not later than 1923.

When it is considered that the huge present-day English airships have a capacity of 2,000,000 cubic feet of gas, and which can now cover a radius of 4,000 miles without coming down to earth or renewing their supplies, it will be seen that universal aërial transportation is a feature much closer at hand than is realized by most of us.



There is little doubt that before this year has ended one or more dirigibles will have crost the Atlantic Ocean. Flying at their present rate of speed, which is sixty miles per hour, it will be seen that the trip from London to New York will take only 2 to 2½ days. The huge 5,000,000 cubic feet of gas airships will probably fly at the rate of 100 miles per hour. The length of the trip will then be cut down to about 1½ days.

While the aërial tower which we discust above is probably satisfactory, it has many objections, the most important one being that it is an expensive item, and, moreover, if the airship is to rely upon such a structure, it will be almost impossible for it to come down to earth to land passengers *except at such points where the mooring towers are located.* This is a clear disadvantage.

In the accompanying illustration the writer wishes to advance an idea which so far has not been tried out, but which can be readily adapted. The idea is simply to moor the dirigible by means of four cables, which are thrown from the aërial flier. The passengers then will be able to ascend or descend from the airship by means of light elevators operated between the dirigible and earth. These elevators, electrically operated, need not be very heavy and can be constructed of aluminum, duralumin, or some such material. The power to operate these elevators can be taken from the engines of the dirigible itself, and it will be quite an easy matter to take from fifteen to twenty passengers on a single trip.

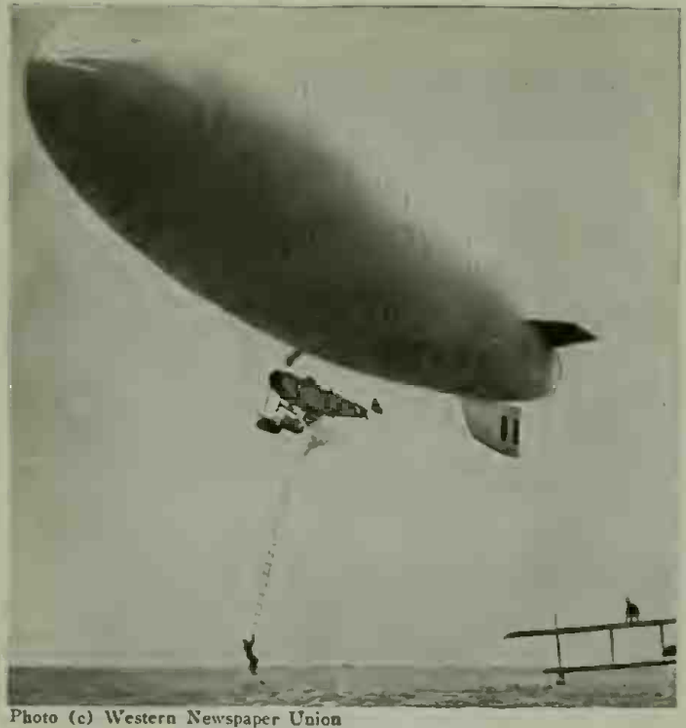
Our illustration shows the city of London, in the year 1925, with one of these dirigibles made fast to the aërial depot; we see here two elevators operating and taking on passengers and freight. The air-

www.americanradiohistory.com

The Heart of London as It Will Appear Very Shortly When the Plans Now Undergoing Completion Are Realized. It Having Been Demonstrated That It Is Very Difficult to Bring Down the Huge Airships to the Ground—Many Zeppelins Having Been Wrecked That Way—It Has Been Proposed to "Land" Airships on Top of Specially Elevated Stations as Here Shown. The Airship would Be Simply Anchored by Means of Four or More Steel Cables. Then, by Using a Number of Light Elevators or Lifts, the Passengers as Well as Freight Can Be Taken on or Put off, as Our Illustration Clearly Depicts. This Is Not a Dream of Tomorrow, but Plans Are Actually Under Way to Make This Feature a Realization. It will Be Seen That the Airplanes Merely Act as a Sort of "Feeder" and They Will Be Used Mostly to Bring Their Passengers or Freight to the Trans-Atlantic Landing Station.

ship shown belongs to the regular trans-Atlantic Service and makes the trip between London and Perth, Australia in 4½ days. Should it become necessary to discharge or take on freight at non-important centers, it will be a simple matter to moor the airship by means of its cables even over a city which has no elaborate landing station. Nothing but four points to which to make the cables fast are required. The elevators which are carried by the airship will do the rest.

Our cover illustration shows a spectacular method of an aërial rescue at sea, which immediately demonstrates the practical use of these elevators. Indeed, the airship does not need to make fast to the wrecked airplane; it will keep its position simply by running either one or more of its propellers in order to keep from drifting. This is quite simple even for the present-day airship, as it is possible by means of its propellers to hover over a certain spot even with a strong wind blowing. In this case, the elevator cables only are made fast to the wrecked flyer, the gasoline tanks of which have been set on fire. After the elevator cables are made fast, it will be a comparatively simple matter to take off the passengers, and, if necessary, the freight, for the buoyancy of the airplane in the water will probably keep it afloat for some time. After everybody is taken off, the elevator is hoisted, the elevator cables pulled in, while the airship proceeds on its way.



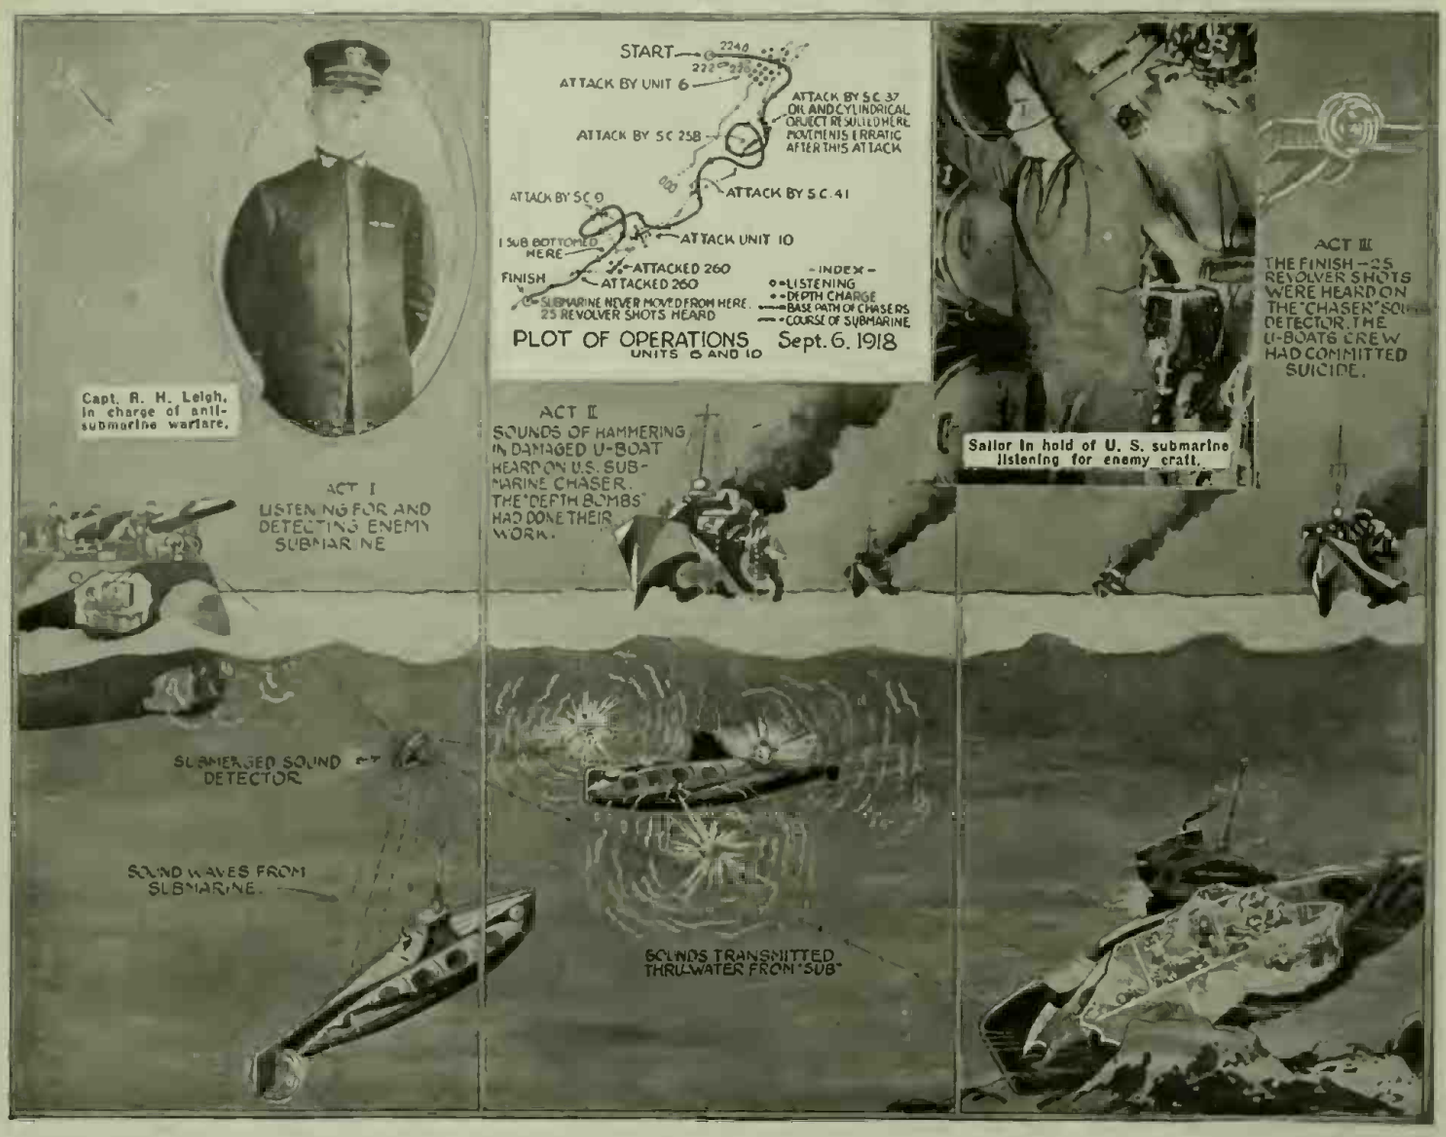


Photo (c) Western Newspaper Union

This Remarkable Snapshot Shows One of Our Navy's Dirigibles Rescuing Two Airmen Who Recently Fell Into the Sea with Their Flying Boat off Key West, Florida. One of the Aviators Can Be Seen Climbing up the Rope Ladder.

This spectacular rescue might seem to be a thing of the future, but indeed it is not. Our photograph herewith shows that the very same thing has already been accomplisht on a smaller scale. Very recently the United States Navy equipt its dirigibles with rope ladders, which made it possible to rescue aviators from the sea. That such a move was indeed wise, our photograph demonstrates better than words. Our remarkable snapshot shows one of the Navy's "blimps" rescuing two airmen who recently fell into the sea with their flying boat off Key West, Fla. The nose of the airship was simply turned into the wind, and after some maneuvering it finally managed to get directly over the disabled flyer. The two marooned airmen experienced no difficulty in grasping the rope ladder and climbing aboard the airship, none the worse for their adventure.

Hunting the U-boats by "Sound" Proved a Successful and Profitable Allied Naval Game—So Successful in Fact That, Had the War Lasted Another Year, the U-boats Would have Been Driven Completely from the Seas.

Hunting Submarines by Sound

By BREWSTER S. BEACH

How Yankee Scientists Beat the German U-Boats

THE United States Navy Department, after nearly two years of the closest censorship, has just given approval to the publication of certain data relating to the development in the United States during the war of submarine detecting devices, which were used to signal advantage by this country and the Allies in prosecuting and bringing to a successful conclusion the campaign against the German U-boat.

The apparatus may be termed the composite work of the General Electric Company, Submarine Signal Company, Western Electric Company, the National Research Council, assisted and advised by many eminent scientists, engineers and research specialists—chief among whom were Drs. W. R. Whitney, Irving Langmuir and W. D. Coolidge, Prof. R. A. Millikan, Prof. Max Mason, and others.

Realizing that the prompt solution of the submarine problem was the key to a successful termination of hostilities, Secretary Daniels, immediately upon America's entrance into the conflict, appointed a special board to devise ways and means to overcome it.

At the suggestion of Dr. Whitney, director of General Electric Company's research laboratories, a group of scientists was formed at Nahant, Mass., under Dr. Irving Langmuir, where the results of extensive research activity were put to practical tests under actual conditions as nearly as possible approaching those in European waters.

Another group under Prof. Millikan, head of the Physics Department of the University of Chicago, was organized at New London, Conn., where the work of both bodies was later co-ordinated.

Out of the efforts of these two groups and the work carried on in Schenectady assisted by Allied commissions of scientific men, there grew the American Submarine Detector—a development of the old principles of sound wave transmission in water in an altogether new and startling manner, and just how efficient this "detector" proved we shall see later.

The apparatus finally perfected and put to immediate use, was first designed to hang overhead from naval craft amidship below the water line and it depended for its direction-getting qualities on the peculiar and heretofore little understood faculty

THIS article describes the effort made by American scientists, under the stress of tremendous urgency, to invent and perfect an instrument to successfully locate submarines while in a submerged condition, at a time when every instant of delay meant further loss to shipping, and the fate of the Allied cause practically depended on the immediate defeat of German U-boat warfare. The Submarine Detector, as eventually evolved by them, utilizes old principles in a new and startling way. It is based on the theory of sound-wave transmission thru the water and depends for its direction-getting qualities on the peculiar and heretofore little understood faculty of the human ear to detect the direction of sound by the shifting of that sound from one ear to the other.

www.americanradiohistory.com

of the human ear to detect the direction of sound by the shifting of that sound from one ear to the other.*

Early Experiments

Every possible application to which electricity had been put was studied with painstaking care by experts during the development of the "Submarine Detector," and many experiments were carried on at New London and at Nahant with pliotrons, with amplifiers, with the Fessenden oscillator, which had been developed by the Submarine Signal Company, and with other similar instruments, before the proper combination of the principles of electricity and acoustics produced the final and successful device subsequently used.

Specialists in physics and acoustics from the great technical schools, such as Columbia University and Harvard, from the Research Laboratory of the G. E. Co. and the W. E. Co., and in fact from all over the United States, played a prominent part in the work done, particularly by the New London Group, altho unfortunately the armistice was signed before the latest devices developed here could be put into extensive use on the other side of the water.

Owing to the interference of sounds made by the listening ship's own motors, it was found more practical to stop the engines when about to take observations and this added greatly to the effective range of the instrument.

To overcome this obstacle, another device was developed *which could be trailed off the stern a hundred or so feet away* where the engine noises of the ship were out of range and the sound was then brought into the operator in the ship's hold.

A third adaptation of the listening principle was an instrument which protruded thru the hull and was a stationary part of the vessel's equipment. A somewhat circular device was constructed for use on submarines, but all of them were used to advantage.

While demonstrating the device to the British Admiralty, our American engineers were asked to study the question of fitting submarine detection units to airplanes, balloons and dirigibles.

After some experimentation, followed by more practical tests and conferences with the Lancashire Group of scientists at Harwich, apparatus was developed which met these needs and many *aircraft* were equipt with sound detectors *which rendered it possible for them to follow the course of the enemy submarine after they had seen her submerge, a valuable faculty which such craft did not possess until the introduction of the American detector.*

Allies Adopt Yankee Invention

However, when the devices had proved themselves eminently satisfactory after exhaustive experimentation here, the Navy Department organized a special Service Party under Capt. R. H. Leigh of the Bureau of Steam Engineering to demonstrate the detectors to the British Admiralty. Shortly after the arrival of this party abroad, the American submarine detectors were universally adopted by all the Allied navies.

It was found to be much superior in many ways to any of previous development, and came to be considered one of the most effective offensive weapons ever used against the submarine.

To sum up the results achieved by these American listening devices it is only necessary to recount a few pertinent points to illustrate the device's practicability.

In spite of it all, initial experiments proved slow of entirely satisfactory developments until the fall of 1917, when it was decided to go out to sea off Cape Cod for more thorogoing tests.

The sea was clear of craft as far as the eye could see—yet the operator with his ear to the detector distinctly heard a vessel approaching—nearer—nearer—nearer. The captain from the bridge eagerly scanned the horizon with the ship's glasses—nothing in sight.

"Send a man aloft with powerful glasses," he commanded. "The detector has picked up a craft 3 points on our starboard bow."

The sailor returned. "Nothing in sight, sir."

"I'll go aloft myself. That boat sounds as if it were very near. Why, we can hear her engine as clearly as if she were alongside."

Puzzled, the captain returned from the masthead after a disappointing vision of a calm and perfectly clear sea.

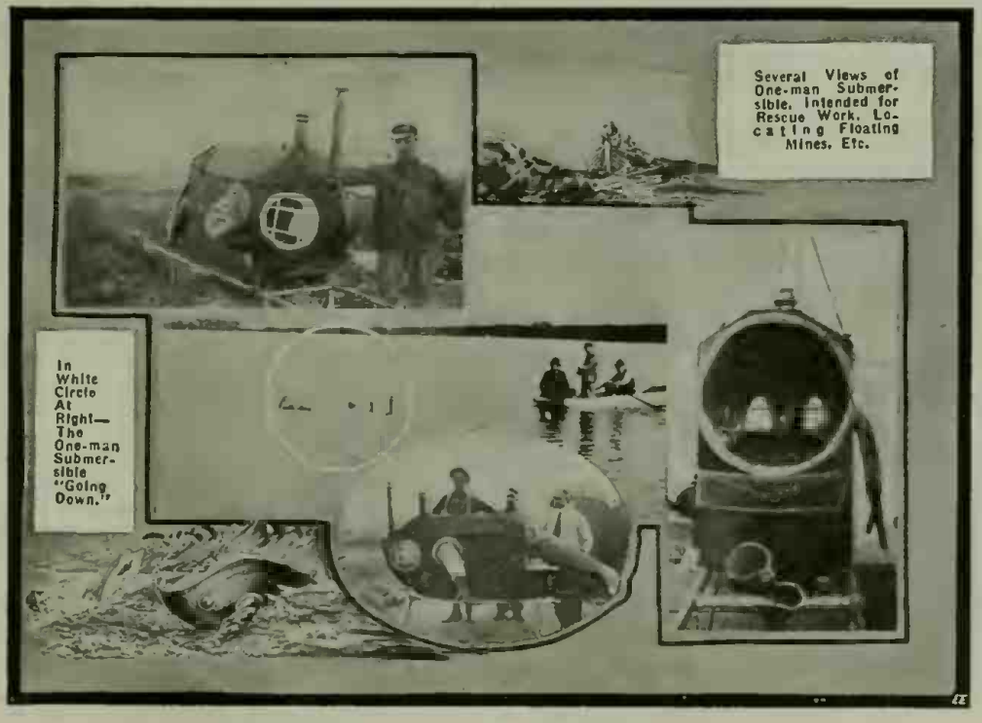
"How's she coming?" shouted the first lieutenant down the hatchway.

"Heading straight for us, sir. Sound getting louder every minute."

There was nothing to do but wait.

The captain pulled out his watch and sat down. Fifteen minutes—half an hour—an hour—ticked on!

(*Continued on page* 167)



* Another very interesting point is that when mounting microphones on each side of a vessel, the *loudness* of the incoming sound is equal in both telephone receivers, i. e., if a submarine is on the starboard side of the ship, it will be heard just as loud from the port side. But, the difference can be readily detected and very accurately too, by the *phase difference* as heard in the 'phones. In other words, the sound will be heard a fraction of a second earlier in one ear than in the other. Small as this difference is, even a green operator will detect it at once.

—*Excerpt from Mr. H. Gernsback's editorial in the October, 1917 issue of this journal.*

That One-Man Submersible

IN the March issue of this journal there appeared an illustrated article describing a newly invented, one-man submersible boat, intended for purposes of life saving, locating floating mines and other purposes. At the time the article was prepared, the Editors only had the inventor's patent to guide them in its preparation, and the illustration was prepared by one of the staff artists. But behold! This strange animal of the deep really lives, as the accompanying photographs of the actual working device prove. The inventor of the one-man submersible is W. R. Barringer, of Denver, Col., which is a long way from the sea, and it puzzled the Editors how a rank land-lubber such as the inventor appeared to be, could have the heart to work out a complete submarine or anything akin to that device. But now the secret is out, for it appears that the inventor, who was formerly in the United States Army, had gained considerable experience while in foreign lands, and he evolved the principles underlying his submersible boat while observing the methods of pearl and sponge divers in the far-distant Sulu Archipelago.

The makers of the Barringer one-man submersible, claim, among other things, that, due to its peculiar construction, no pressure is required to offset the tremendous external pressure of the water, even when submerged to such depths as 350 feet, for which this submersible is practicable. It is interesting in this connection to mention that the maximum depth reached by U. S. Naval divers in especially constructed diving suits and bells, is less than 300 feet. Moreover, in the ordinary diving suit the tremendous internal pressure of 130 pounds per square inch is necessary to remain at a 350-foot depth for any length of time. This new submersible diving outfit requires but the normal pressure of 15 pounds per square inch, regardless of depth attained. The inventor also claims that no strain is occasioned on the operator, even after a long period under water. The operator rests on a heavy air cushion and suffers no ill effects while below the water's surface. Further, the ascent and descent of the boat need not be done gradually, as in the case of the ordinary diving suit or bell, in order to accustom the body to the changing water pressure. On the contrary, so he claims, ascent may be made rapidly, and the operator's time is, therefore not wasted in slow sinking or rising.

As pointed out in the previous article, there are many interesting electrical features incorporated in this device, including electrical propelling and steering means, an electric searchlight and many other novel devices.

My Inventions

By Nikola Tesla

V. The Magnifying Transmitter

AS I review the events of my past life I realize how subtle are the influences that shape our destinies. An incident of my youth may serve to illustrate. One winter's day I managed to climb a steep mountain, in company with other boys. The snow was quite deep and a warm southerly wind made it just suitable for our purpose. We amused ourselves by throwing balls which would roll down a certain distance, gathering more or less snow, and we tried to outdo one another in this exciting sport. Suddenly a ball was seen to go beyond the limit, swelling to enormous proportions until it became as big as a house and plunged thundering into the valley below with a force that made the ground tremble. I looked on spellbound, incapable of understanding what had happened. For weeks afterward the picture of the avalanche was before my eyes and I wondered how anything so small could grow to such an immense size. Ever since that time the magnification of feeble actions fascinated me, and when, years later, I took up the experimental study of mechanical and electrical resonance, I was keenly interested from the very start. Possibly, had it not been for that early powerful impression, I might not have followed up the little spark I obtained with my coil and never developed my best invention, the true history of which I will tell here for the first time.

This Photograph Shows the Famous Tesla Tower Erected at Shoreham, L. I., N. Y. The Tower Was Dismantled at the Outbreak of the War. It Was 187 Feet High. The Spherical Top Was 68 Feet in Diameter.

Note the Huge Size of the Structure by Comparing the Two-story Power Plant in the Rear. The Tower Which Was to be Used by Tesla in His "World Wireless," Was Never Finished. Illustration Opposite Shows it Completed.

Scrapping the World's Engines.

"Lionhunters" have often asked me which of my discoveries I prize most. This depends on the point of view. Not a few technical men, very able in their special departments, but dominated by a pedantic spirit and near-sighted, have asserted that excepting the induction motor I have given to the world little of practical use. This is a grievous mistake. A new idea must not be judged by its immediate results. My alternating system of power transmission came at a psychological moment, as a long-sought answer to pressing industrial questions, and altho considerable resistance had to be overcome and opposing interests reconciled, as usual, the commercial introduction could not be long delayed. Now, compare this situation with that confronting my turbine, for example. One should think that so simple and beautiful an invention, possessing many features of an ideal motor, should be adopted at once and, undoubtedly, it would under similar conditions. But the prospective effect of the rotating field was not to render worthless existing machinery; on the contrary, it was to give it additional value. The system lent itself to new enterprise as well as to improvement of the old. My turbine is an advance of a character entirely different. It is a radical departure in the sense that its success would mean the abandonment of the antiquated types of prime movers on which billions of dollars have been spent. Under such circumstances the progress must needs be slow and perhaps the greatest impediment is encountered in the prejudicial opinions created in the minds of experts by organized opposition. Only the other day I had a disheartening experience when I met my friend and former assistant, Charles F. Scott, now professor of Electrical Engineering at Yale. I had not seen him for a long time and was glad to have an opportunity for a little chat at my office. Our conversation naturally enough drifted on my turbine and I became heated to a high degree. "Scott," I exclaimed, carried away by the vision of a glorious future, "my turbine will scrap all the heat-engines in the world." Scott stroked his chin and looked away thoughtfully, as though making a mental calculation. "That will make quite a pile of scrap," he said, and left without another word!

IMAGINE a man a century ago, bold enough to design and actually build a huge tower with which to transmit the human voice, music, pictures, press news and even power, thru the earth to any distance whatever without wires! He probably would have been hung or burnt at the stake. So when Tesla built his famous tower on Long Island he was a hundred years ahead of his time. And foolish ridicule by our latter day arm-chair "savants," does not in the least mar Tesla's greatness.

The titanic brain of Tesla has hardly produced a more amazing wonder than this "magnifying transmitter." Contrary to popular belief his tower was not built to radiate Hertzian waves into the ether. Tesla's system sends out thousands of horsepower thru the earth—he has shown experimentally how power can be sent without wires over distances from a central point. Nor is there any mystery about it how he accomplishes the result. His historic U. S. patents and articles describe the method used. Tesla's Magnifying Transmitter is truly a modern lamp of Aladdin.

EDITOR.

"Aladdin's Lamp".

These and other inventions of mine, however, were nothing more than steps forward in certain directions. In evolving them I simply followed the inborn instinct to improve the present devices without

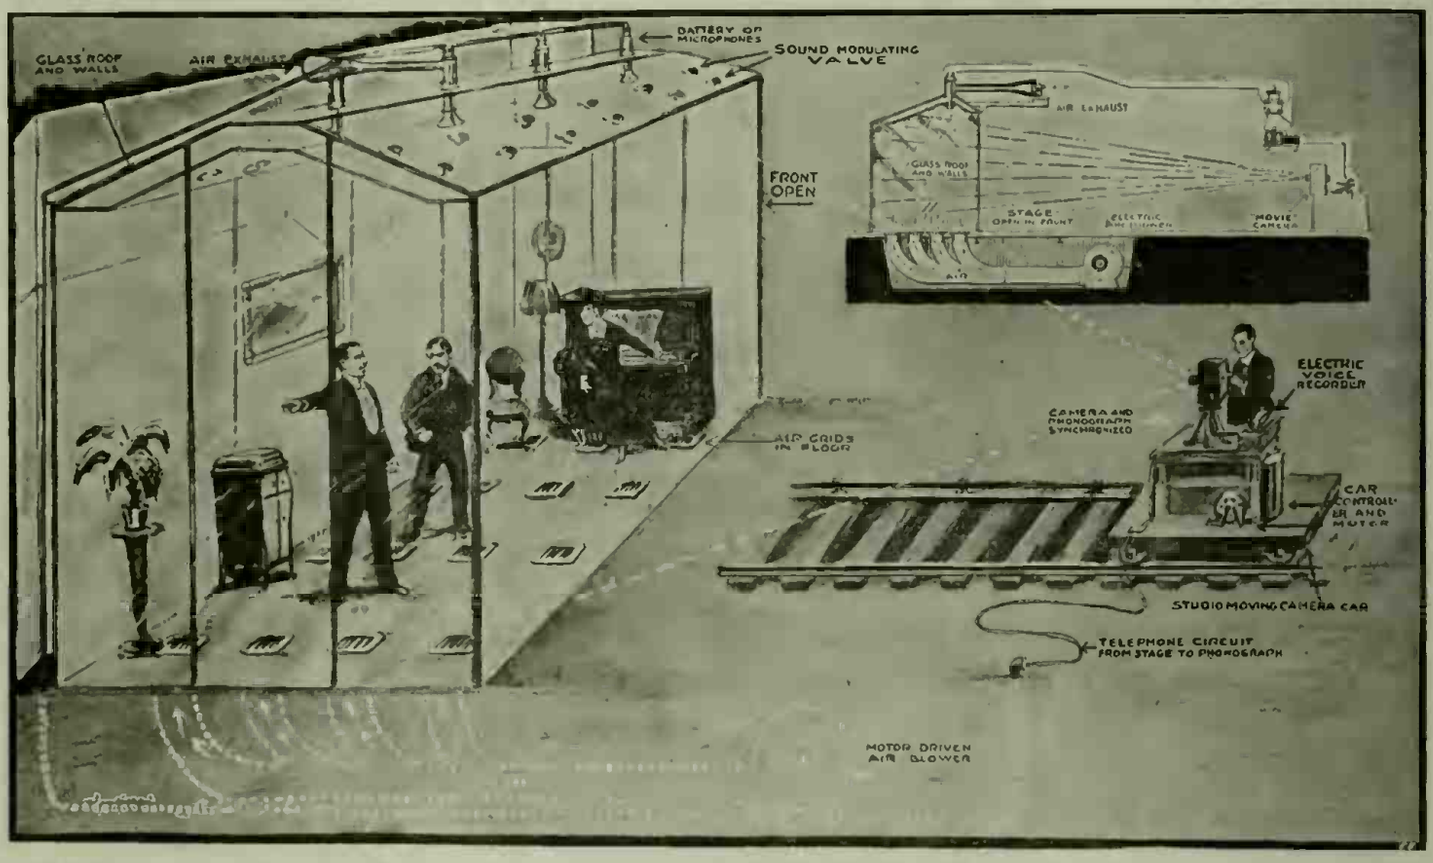
Filming "Talking Movies" in Glass Houses

By H. WINFIELD SECOR

YOU probably remember the old adage about "people who live in glass houses, should"—etc.—but the latest is the filming of talking motion pictures in all-glass houses or studios, and the process has been invented by one —David O. Royster of St. Louis, Mo., the "show-me" state. Mr. Royster's scheme covers an improved method and apparatus for synchronously making motion pictures and sound records.

As the inventor points out, it has heretofore been very difficult, if not indeed impossible, to make talking motion pictures which would bear a perfect synchronous relation to each other when reproduced, for the reason that the camera used in taking the motion pictures must necessarily be located a certain distance away from the object to be photographed, and being that the sound recording device is located adjacent to the camera in order to operate in synchronism with it, the distance between the receiver on the sound recording apparatus, and the actors being photographed, is such that the sound waves in traveling from the object to the recorder, do not reach the latter for an appreciable length of time. As a result the recorded sounds are not exactly synchronous with the pictures, when these sounds and pictures are later reproduced in the theater projector. And besides, with such an arrangement the sound waves are insufficient in volume to make a clear and strong record on the disc or cylinder of the talking machine.



Mr. Royster, in his scheme, provides a transparent *glass studio stage*, or *all-glass house*, if the scene requires it, which is occupied by the objects to be photographed. Thus motion pictures can be made by natural light; means are also provided for concentrating the sounds produced by the speakers, which sounds are telephonically transmitted to the sound recording device, such as a phonograph, located adjacent to and operated synchronously with the motion picture camera.

As is the practise in all of the larger studios, the camera and other appurtenances, such as the sound recording phonograph, etc., are mounted on a wheeled truck, which may be moved along a track, or set of tracks, so as to take either "close-ups" or normal focus pictures, as desired, also to make changes quickly. Some studios utilize a small electric car fitted with a motor and controller, so that the camera man or his assistant can readily move the camera toward or away from the stage, as the occasion may demand. You have probably seen at one time or another a motion picture where the objects came up rapidly toward you, until the actress' face, for instance, was as big as the entire screen. This effect is obtained very easily by moving the car toward the scene. Scenes or settings which fade away, causing the objects to become smaller, are taken in the reverse manner, i. e., by moving the camera away from the stage while the picture is being taken.

There is provided in the present scheme a powerful motor-driven electric blower under the studio floor, which projects a strong draft of air upward thru a series of gratings in the stage floor, and the powerful upward vertical movement of the air thru a series of openings in the glass roof carries the sounds of the voices upward, toward the microphones or sound detectors, which effect is intensified by an electric exhaust fan at the top of the glass-enclosed stage, as shown in the diagram and illustration herewith. The battery of microphones which pick up the sounds at the ceiling of the stage are connected up with a telephone line which leads to the electric recorder on the phonograph beside the "movie" camera, there being a rigid mechanical connection between the camera and the phonograph to ensure synchronism.

Owing to the peculiar and unusual lighting arrangements with this form of all-glass stage, the "setting" or other scenery is placed back of the stage, so as to allow the daylight to pass over it and thru the glass to illuminate the stage proper. Some props and furniture can of course be placed directly on the stage. It is understood that where the light is not sufficiently strong for the taking of motion pictures, the stage can be lighted artificially. The degree of sound transmitted by the microphones fitted over the stage may be modulated by means of adjustable valves placed in front of the microphone, and also by opening more or less of the by-pass valves in the glass inner ceiling, which permits some of the air-conducted sound waves to pass between the two ceilings and out thru the fan chamber.

The apparatus as here described is comparatively simple, can be easily operated, does not require artificial light, and motion pictures and sound records of absolute synchronism can be readily made at any distance from the object within the focal length of the camera, claims the inventor. All things considered, it would seem to presents a new and successful "Movie" idea.

The Secret of Perfect "Talking Motion Pictures" Lies in the Proper Synchronism Between the "Pictures" and the "Voice," and Also in the Clarity and Even Tone of the Speech Reproduction. All Three of These Problems Have Been Solved by the Invention of the Glass Enclosed Stage Here Illustrated.

This Portable Wireless Telephone Was Perfected by W. W. Macfarlane, of Philadelphia. Photos Show Mr. Macfarlane with His Invention and Stove-pipe Aerial. With This Two Persons May Hear the Conversation Being Carried on Fifty Yards Away.

Photos by Int. Film Service

Call Up Wifey on the "Stove-Pipe" Radio

A MAN with a box slung over his shoulder and holding in one hand three pieces of stove pipe placed side by side on a board climbed into an automobile on East Country Road, Elkins Park, Pa.

As he settled in the machine he picked up a telephone transmitter, set on a short handle, and said:

"We are going to run down the road. Can you hear me?"

Other passengers in the automobile, all wearing telephone receivers, heard a woman's voice answering: "Yes, perfectly. Where are you?"

By this time the machine was several hundred yards down the road and the voice in the garage was distinctly heard.

This was one of the incidents in the first demonstration of the portable wireless telephone outfit invented by W. W. Macfarlane, of Philadelphia.

Mrs. Macfarlane, sitting in the garage back of the Macfarlane home, was talking thru the wireless telephone to her husband, seated comfortably in a moving automobile 500 yards away.

The occupants of the car were a chauffeur, a reporter and a photographer. All wore the telephone receivers and could hear everything Mrs. Macfarlane was saying. The chauffeur had no other apparatus than the receiver with the usual telephone cord attached by a metal clip to his steering wheel.

Lying beside Mr. Macfarlane was the foot-square box, the only "secret" in the whole demonstration. What is in the box is the inventor's mystery. This box weighs about twelve pounds. The other machinery used consisted only of the usual telephone transmitter and receivers and the three pieces of stovepipe standing erect on a plain piece of board. This forms the *aërial* of the apparatus.

Before starting on the automobile demonstration of his wireless telephone Mr. Macfarlane stood in the garage and directed the movements of a soldier in a field more than 200 yards away from him. This soldier assisiant had a pair of telephone receivers over his head, connected by a wire with two metal clasps to his rifle (see photo herewith). He marched and halted and about-faced and left shouldered arms out there in the field the instant Mr. Macfarlane gave the order thru his little hand wireless 'phone in the garage.

The "July" Number of the Electrical Experimenter

"Hello Europe"—via Radio. Complete story of How Secretary of the Navy Daniels talked via the New Brunswick Radio Station to President Wilson in France, by Charles M. Ripley.

"My Inventions"—Part VI—by Dr. Nikola Tesla, himself. Besides a big feature surprise article by the world's master inventor.

Interesting Facts About the Electron—How big are atoms and electrons? by L. R. Jewett.

Faradic Currents and How to Apply Them. Including rheumatism, nervous complaints, and other ailments. Treatment with apparatus described in the present issue.

A Rattling Good Electric Story—"How 'Don' flashed the 'S.O.S.' ", by Mabel M. Davis.

New Electric Detector Net for Submarines.

Loop Aerials—Description of Actual Results obtained over 200 mile distances, by Prof. Lloyd M. Knoll.

Tree Wireless—How living trees receive radio messages across the ocean. The wonderful work of General George O. Squier, Chief Signal Officer, U. S. Army.

Storage Battery Testing—Practical Technique in simple language, by Harold R. Adams, storage battery engineer.

Audions operated on Alternating Current—Both Filament and Plate Circuits. Every radio man will want to read this authentic article, by Elliott A. White, formerly Instructor in Radio, Air Service School, Carnegie Institute of Technology.

Mr. Macfarlane said he would make no fanciful predictions as to what his simple, portable wireless telephone might do.

"There are all kinds of possibilities in it," he continued. "If this could have been ready for use in the war, think of the value it would have had. A whole regiment equipt with the telephone receivers, with only their rifles as aërials, could advance a mile and each would be instantly in touch with the commanding officer. No runners would be needed. There could be no such thing as a 'lost battalion.'

"No high power is necessary to operate this wireless. I am using one-tenth of an ampere in this experiment here and the results you see are so good that the voice carries as well as on the usual wire telephone. The telephone system uses about one-fourth of an ampere.

"I am working on a new theory in electricity, and in wireless. I think the accepted principle of the waves is only part of the story. There is something else. It is that something else that I am utilizing. There is no supplementary current in this system as in the usual wireless operation. There is no static and no interruption."

An umbrella, Mr. Macfarlane explains, will serve as well as a rifle for an aërial. "A plain citizen carrying a small handbag containing the compact wireless outfit and with his umbrella held aloft can walk along the street talking with friend wife at the house at the other end of the city," he said.

"How costly would this outfit be?" he was asked.

"Nothing new is used," he explained. "All the apparatus fits in with existing devices. Everything needed for the outfit could be bought for probably $15."

"My apparatus here is rather crude and not all the quality of current is obtained that I can get," he continued. "But it is no wild dream to say that a man riding on a train to New York can telephone his wife about bringing a friend home for dinner by using this device. It will be perfected thus far before very long. This apparatus here needs improvement, but it demonstrates the practicability of the thing. Even now I can connect up the end of the wireless in the house with the existing telephone system and thus can talk from my automobile with any person in the city."

Tin-Can Models—A New Art

By GEORGE HOLMES

IMAGINE if you can on one side a scene, wildly confusing, resembling a rubbish heap of every conceivable sort of tin-can, from the tomato to dainty tin-boxes which once upon a time held My-Lady's peach and cream complexion.

Picture, on the other hand, a scene with beautiful, splendid and practical toys, such as money could not buy, all evolved from these same tin-cans and boxes, with a little touch of imagination, inventiveness and mechanical knack, plus a pair of pliers, a soldering iron and the transformation is complete.

The originator and "wizard" of the tin-can toys is Mr. Edward Thatcher, of Teachers' College, Columbia University. It was he who hit upon the novel plan of utilizing waste tin-cans and from them making amusing, decorative and instructive playthings. He gave an inkling of this new art to his classes at Columbia and the students took it up with such zeal that these models were eligible for the recently successful public exhibition at the Art Alliance Galleries.

As his bit in the war, Mr. Thatcher was successful in having this artcraft introduced in the hospitals both here and abroad; and so helped the wounded soldiers to find a remunerative and amusing pastime which greatly aided in keeping their minds off their troubles. Even such men as were suffering from shell shock took to the tin-can toys; it would seem at first impression that they could not stand the noise of the hammering on the cans, but the reverse proved the rule. In cases where they would jump if a match box were dropt, they seemed not in the least inconvenienced by the sound of the constant tinkering of the tin-can artists and would work all day in the "toy-shops."

The possibilities of this new artcraft are practically unlimited. Where heretofore the wounded have occupied their time in the making of these toy models, the art is spreading the country o'er and will be one of the subjects taught in many schools. Some of the models here shown have been duplicated by ten-year-old boys at the Edgewater Manual Training School.

Most interesting of all is the composite view showing a toy *Army Truck*—"before and after." All the various forms of cans necessary to construct this truck are shown on the left, while on the right may be seen the completed model. The body of the truck was made from the side of a "Wesson" oil can, the wheels were made from evaporated milk cans, the seat from a cocoa box and the hood and radiator from an olive oil can. The indentations for the radiator, to resemble the cooling tubes, were faithfully reproduced by punching many hundreds of holes so as to give it that "corrugated" appearance; I think that would be the proper word, still not envying the long and tedious task it must have been to put all those holes into (or should we say "out of") existence. The radiator cap came from the top of a tooth paste tube and the side lamps and tail-light from screw caps of various olive oil cans.

Drifting back to our war atmosphere we have the steam tractor pulling a "Giant" gun. The tractor was brought to life from these various items: The fire-box and platform from a much abused sardine box, the boiler from another olive oil can, the steam whistle from the top of a "Lyons Tooth Powder" can, wheels from evaporated milk cans and the roof from the side of a square tin. The dummy driving wheels are made from the top covers of "Crisco" cans, soldered together so as to make a sort of pulley face for the driving cord. The long-range gun was built from a shaving-stick box, with the evaporated milk cans again doing duty as wheels.

These model toys are not self-propelling but could easily be made so. It would seem that Mr. Thatcher was born to the model business. He has constructed many real "live" models that work by themselves, notable amongst these being a large-size model of one of the Pacific Coast "mallet type" locomotives, that runs under its own power. The author also had the pleasure of seeing a model "tractor," built along the lines of the one constructed from tin-cans, only this one was made of brass and ran under its own steam.

Mr. Thatcher has found it advisable to write a book on this interesting subject which undoubtedly will find a great demand when it comes off the press. And so we see this new "rage" equally successful with the younger classes as well as at the Teachers' College at Columbia, where, among society folks, they call it "occupational therapy."

(*The Editor will be pleased to receive good photos of tin-can models of electrical things. To mention a few that our readers can readily construct: Telephone, electric generator, electric locomotive, radio sets, airships, etc.*—Editor.)

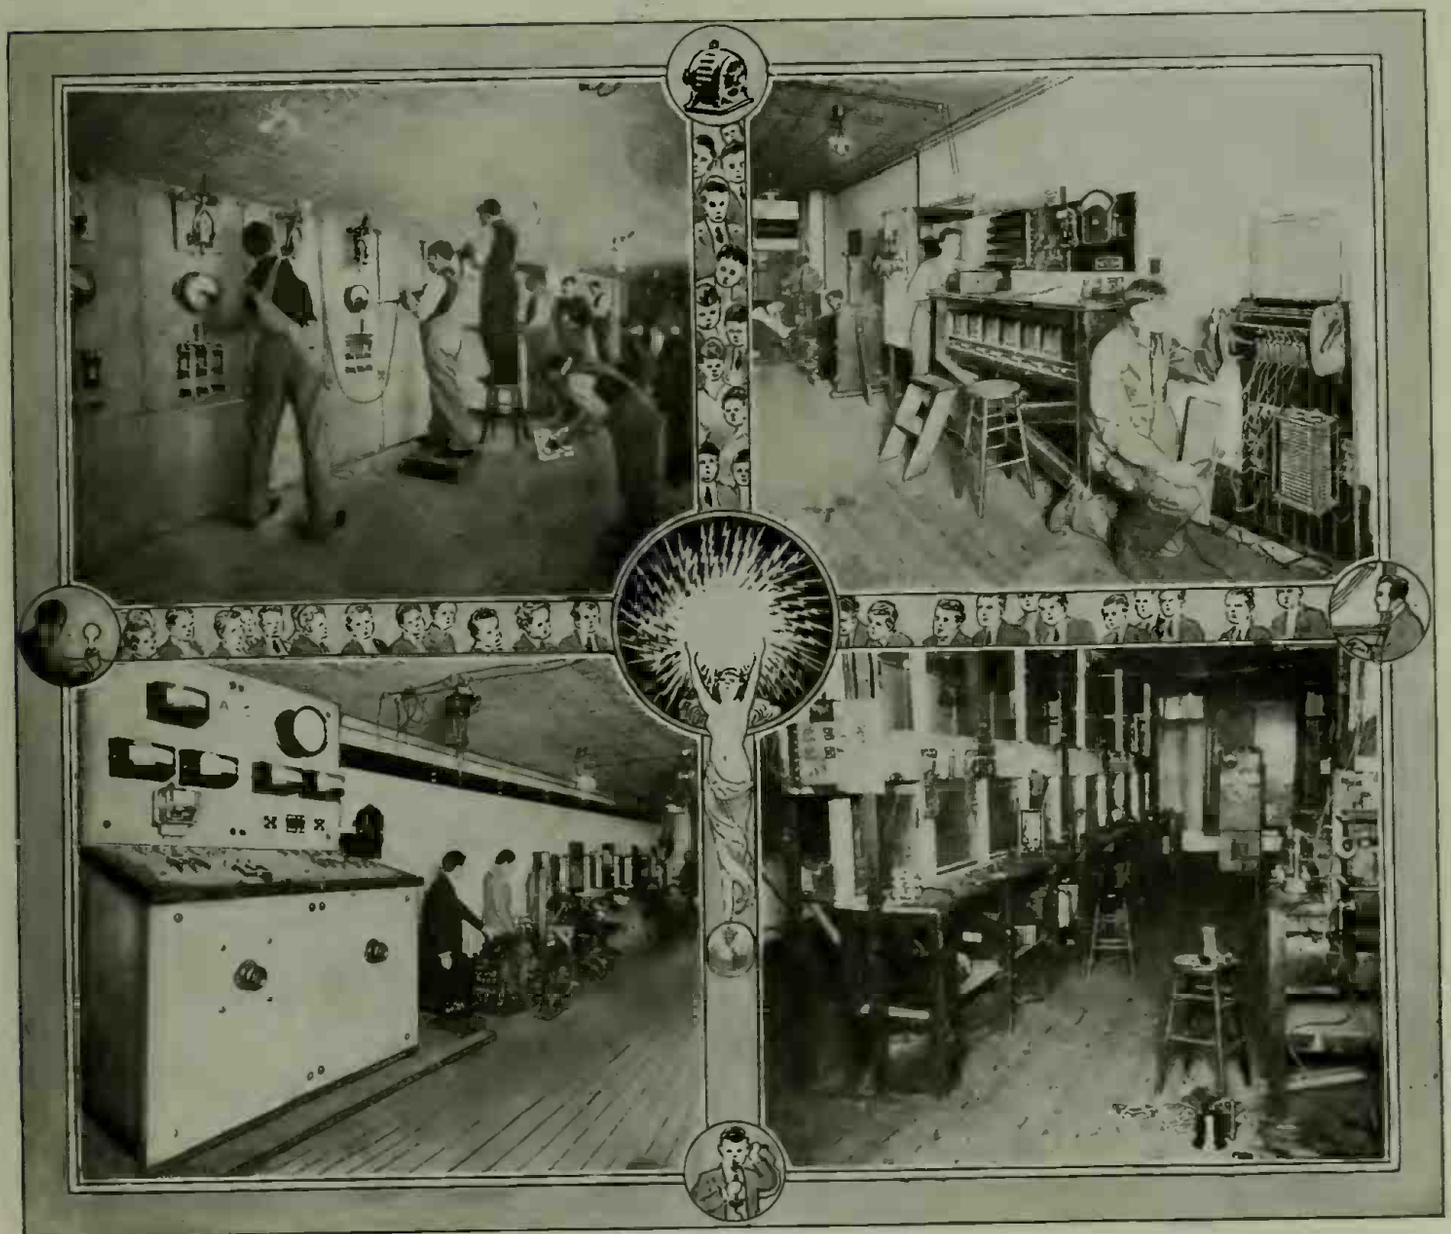
Making a Practical Electrician

THE world has never before witnest the vast opportunities that at the present moment lie before the people of the United States. Europe, with its shell torn territories and completely exhausted stocks of raw and finished materials, turns to the one country in the whole world fitted to rehabilitate its wastes and reconstruct its shattered industries.

America has a gigantic task before it—not only to feed practically the whole world, but to rebuild a great portion of it. The real business men, the men of creative genius and untiring skill, realize the enormity of the job they must undertake. They know that if the U. S. meets the test, a period of wonderful prosperity is open at its door. The one problem that confronts the business executive to-day is that of labor—*skilled* labor. Can we turn out enough trained men to meet the tremendous demand?

In no other field is the need of thoroly trained men more apparent than in the electrical world. On every side comes the cry for the trained electrician, the man of action, with vim and vigor and the "knowledge of how to do things." Daily we read of the marvelous accomplishments of the wonder of the age—ELECTRICITY. This power in the business life of to-day will play a leading rôle in the world's reconstruction. The United States is rapidly developing its own natural resources and enlarging its field of endeavor—to say nothing of the vast power houses, the new electrified railroads, and the thousands of other electrical needs of Europe. It is to the young man of to-day who is now considering what vocation to take up and who will be the worker of to-morrow, that we look with expectant eyes.

Dr. Charles P. Steinmetz, Chief Consulting Engineer of the General Electric Company, has said that, "The world needs men who know something of electricity, of the operations and control of electrical power. It needs men more every year, its very existence depends on the electrician."



In the greatest city of the United States, in its very heart is located a school, whose aims and purposes are to teach men, both young and old and from every walk of life, the How and Why of electricity by the greatest teacher known—that of getting knowledge by actual experience.

A trained man is the finished product, one who understands the problems coupled with a broad experience in electrical engineering.

Theory is a necessity, but this busy world of ours wants more than theorists. He who is able to supplement his theoretical knowledge with the proper proportion of practical, do-it-yourself-knowledge, is the man who will get most of the world's rewards.

The school which has thus revolutionized educational methods has struck the happy medium of combining enough theory with practical work to turn out first-class electricians in the shortest possible time.

Close-Ups of New Scientific Movies

By GEORGE VANDERBILT

THESE up-to-date crooks had the best of everything, including a regularly equipt radio set, but ere they could use it to decoy ships to disaster, big and powerful "Reggie" had the strangle hold on our pirate Wireless Operator. Tho there were no women present, curls were in vogue in the radio shack, as can be seen in the accompanying photograph, showing the artistic hook-up of the set.

Whatever else may have happened to him, he had brawn and muscle! That, and that alone, saved Reginald Jones in the new Fox Film, "Never Say Quit," when he ran afoul of a gang of crooks on board a ship in search of sunken treasures.

The "JINX" was his constant "pal." It started by his being born on a Friday, and the thirteenth to boot, and so together some one had made a big mistake. From the very first he was in trouble, his childhood was one nightmare. As he grew older it only made matters worse.

The Rôle of Electricity and Science in the Modern Photoplay

As the gay and dashing Lothario he goes to a ball, and gets into a scrap over a girl and has to exit via the house-tops to escape the "Bulls."

Good luck seems to beckon when a rich aunt dies and leaves him a fortune. But not for Reginald! He must come to her funeral in order to get the money, and the jinx sees to it that he never gets there. On his way he is robbed by pickpockets, his eyes are blackened, and he is bruised and walloped until he thinks his head is in his shoes. He misses his train after many harrowing adventures, and so the fortune goes to charity.

To replenish his empty wallet, Reginald sets out on a voyage after sunken treasure. Adventures befall him again, for the crew turns out to be a gang of crooks. They are bent on robbing a millionaire and his daughter, who are on board.

Reginald saves the millionaire and his daughter from the dire fate the crew has in store for them. He wins the girl's hand, heart and soul, and in matrimony he believes he has conquered the jinx at last. But a year later Reginald and his wife are blest with triplets, and Reggie, superstitious cuss, ventures to believe that the jinx has had something to do with that.

In our next movie we come upon a fair and real live "Radioette." The beautiful daughter of an over-indulgent and elderly millionaire. She is abducted by a band of crooks and taken to a desert island to await the payment of a fabulous ransom by her father—or on his failing to pay it, to forfeit her life. BUT—she knew "Wireless," or, as us "hams" now call it, "Radio," and thru this knowledge outwitted the desperadoes' well-laid plans, gaining a hubby thereby, as can be seen in Metro's latest photo-

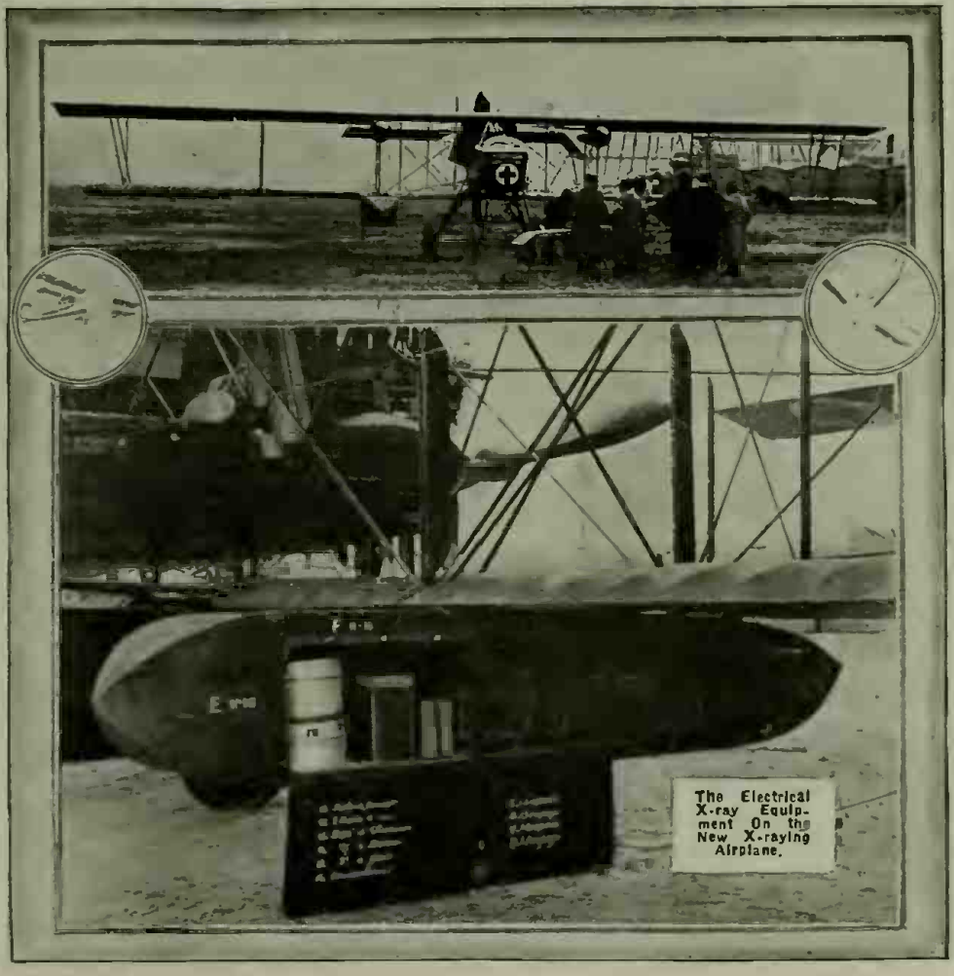
Electro-Therapeutic Ward at Bordeaux, France, Showing the Application of Intensified Rhythmic Faradization by Professor Bergonié. Altho Muscles Are Contracted Violently During This Faradization, the Patient Feels Hardly Anything.

A Wounded Soldier With a Fractured Leg Undergoing Intensified Faradization In Order to Reconstituate the Muscles of the Calf of His Leg. He Was Able to Walk Without a Cane Within Fifteen Days After the Treatment Started.

Paris Letter



By JACQUES BOYER
Paris Correspondent, ELECTRICAL EXPERIMENTER

Paris, April, 1919.

X-RAYING AIRPLANE.

MANY great personalities of the aeronautical world have recently witnest the baptism of the "Aérochir" (from aëro and chirurgeon) at Issy-Les-Moulineaux, near Paris, at the trial of an airplane used for X-raying chirurgical purposes.

The new machine came thru the air from Ville-Coublay, having been in the air for over an hour. This flying ambulance, which can bring medical aid rapidly to the wounded, was designed by MM. Nemirovsky and Tilant and is painted with the conventional Red Cross. It carries all the chirurgical material such as instruments for operating, sterilization, etc., all X-ray machinery, such as a spark coil, transformer, X-ray tubes, fluoroscope, as well as the personnel capable of putting the apparatus to work immediately. The attendants comprise a pilot, chirurgeon and a professional X-ray man. The entire apparatus does not weigh more than 700 kilograms. In peace times a machine of this kind may be used with great success in case of catastrophes, railroad accidents, explosions, etc., which may take place in an isolated spot. In the colonies the "Aérochir" will find large application; colonies naturally not being well populated and having few doctors, located in widely separated points, it will be an easy matter to bring quick aid to patients by means of the "Aérochir," to which distances are immaterial.

The Electrical X-ray Equipment On the New X-raying Airplane.

DR. BERGONIÉ'S NEW RHYTHMIC FARADIZATION.

Many wounded soldiers in the war have seemingly recovered, with the exception of certain muscles which refuse to resume their normal work. Formerly the best method to make these muscles return to normal conditions would be by means of continuous muscular work, as suggested by Dr. Bergonié. One method required professional work or agricultural occupations every day for an indefinite time of the affected members in order to reconstruct the muscles and put them on a normal basis once more. Unhappily, it is not always possible to do this, be it on account of nervous fatigue which sets in rapidly; be it by unseasonable weather, or also where the muscles are so situated that bodily work will not profit them greatly.

For that reason, Dr. Bergonié has brought into being what he calls an *intensified Rhythmic Forodization*, which makes it possible for the wounded to develop their muscles in a remarkably short time. Moreover, such treatment gives the muscles a very strenuous involuntary exercise produced directly by the electrical current.

From the electrical standpoint, the alternating rhythmic faradization utilizes very sharp waves of a frequency giving rise to a moderate convulsing action (50 to 55 per second). The current is produced by a special coil with a well-regulated vibrator, the coil itself giving no sparks. The waves under pressure of between 12 and 14 volts maximum have a periodicity of 15. By means of a standard metronome the current is dis-

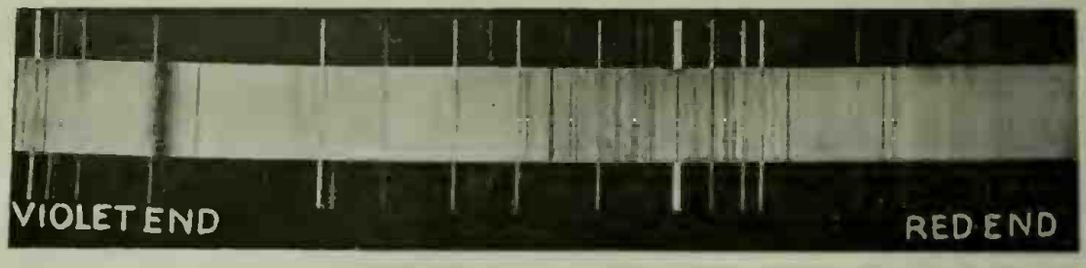
Popular Astronomy

By ISABEL M. LEWIS

of the U. S. Naval Observatory

The Evolution of the Stars

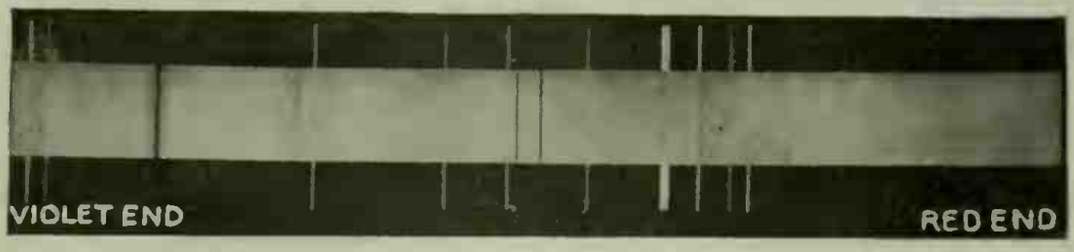


If a ray of white light from the sun is past thru a spectroscope, which consists essentially of a glass prism or cham of prisms, it is broken up into its component rays of different wavelengths which arrange themselves in an orderly band of variegated colors: red, orange, yellow, green, blue, indigo and violet gradually blending one into the other crost by a great number of fine dark lines known as the *Fraunhofer lines* or absorption lines of the solar spectrum. The shortest wave lengths lie in the *violet* and the longest wave lengths in the *red* end of the visible spectrum. Below the red lie the infra-red and beyond the extreme violet the ultra-violet rays, both invisible to the human eye but rendered visible to a certain extent by means of photography and specially dyed plates.

According to the first law of spectrum analysis an incandescent solid or liquid or gas under very high pressure gives a continuous spectrum, that is, an unbroken band of variegated color. If however, cooler gases intervene between us and the source of the continuous spectrum, they will absorb from the light beyond the particular rays of which they themselves consist and as a result the continuous band of color will be crost by a series of dark lines called *absorption lines*, belonging to the cooler intervening gases. To every chemical element belongs its own characteristic lines in this spectrum and no two elements ever have any line or group of lines in common.

Applying these principles to the sun, the central core, consisting either of an incandescent solid or liquid or gas under high pressure (most probably the latter), emits the continuous band of light known as the *continuous spectrum*. The cooler gases of the surrounding solar atmosphere absorb from the light of this central core the particular rays of which they themselves consist and thus produce the multitudinous fine dark lines known as the absorption lines. It is upon the position of these dark lines that we depend for our knowledge of the physical condition of the sun, for obviously, there is nothing in the continuous band of color itself to give us any clue to the nature of the substances from which it originates. If, as sometimes happens, the continuous spectrum is crost by *bright* lines instead of *dark* lines, it shows that the intervening source of light is hotter than the source beyond. An incandescent gas at low pressure, such as incandescent hydrogen, gives a bright-line spectrum or emission spectrum consisting of bright lines upon a dark background. Such a spectrum shows that the body emitting it is a true gas. Nebulae give such a type of spectrum indicating that they are true gases. If, moreover, the central core of the sun could be suddenly blotted out the dark lines of the solar spectrum would immediately appear as bright lines on a dark background, for they belong to incandescent gases, the absorption lines appearing dark by contrast with the more intense light beyond.

2. Eta Leonis—Helium Approaching Solar Type (Harvard Type A0). Hydrogen Lines Have Increased in Intensity. Helium Also Visible But Fainter Than Above and a Few Metallic Lines Begin to Appear.



It is upon these principles of spectrum analysis that our knowledge of the physical constitution of the stars depends. The sun is simply one of the stars and the solar spectrum is duplicated almost line for line in a certain type of star known as the *solar stars*. Most of the chemical elements existing in the sun's atmosphere have been identified by comparing the dark absorption lines in the solar spectrum with the lines in the spectra of terrestrial elements produced in our laboratories. It has been found *that all the elements that exist on our own planet occur also in the sun* and the same elements that exist in planet and sun enter into the composition of the stars.

1. Beta Geminorum (Pollux) Solar-type K, Slightly More Advanced in Type Than Our Own Sun Which Belongs to Type G.

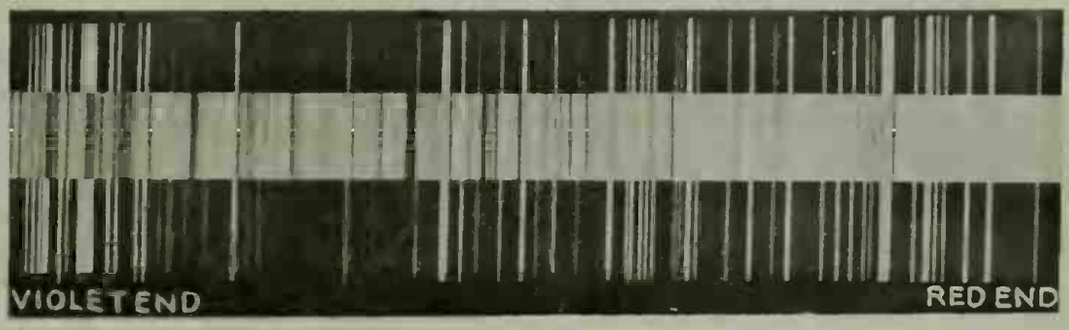
By passing a ray of light from a far distant star thru the spectroscope and producing its spectrums, it becomes possible to compare the positions of its characteristic lines with the lines of the same elements in the solar spectrum. It is in this way that we learn the nature of the atmospheric gases of the stars. It must be remembered that it is the *surface* conditions of the stars and their *outer* gaseous envelopes that can be studied by the spectroscope. From the star's deep interior we receive only the continuous band of color.

The first general classification of the stars according to their spectra was made by Father Secchi, the Italian astronomer, and was publisht in 1849. It was the result of a study of the visible portion of the spectrum with a small telescope and only stars showing dark absorption lines were studied. Since that time more elaborate classifications of stellar spectra have been made—chiefly at the Harvard College observatory, where many thousand spectrograms (photographed spectra) have been studied and classified. The Harvard classification of star spectra has now been generally adopted by all astronomers. The importance of the work done along this line at the Harvard Observatory can be judged by the fact that the Henry Draper catalogue of stellar spectra now in process of publication by this observatory *gives the spectra of two hundred thousand stars.*

The first two volumes of the catalogue, which consists of nine volumes in all, are

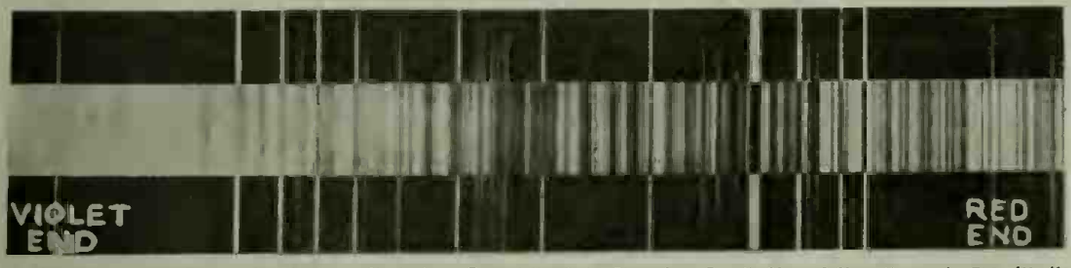
1. Rigel (Beta Orionis)—A Helium Star Showing Strong Absorption Line of Hydrogen (to Left) and Helium (Near Center) and Absence of the Metallic Lines Characteristic of Solar Type Stars.

www.americanradiohistory.com



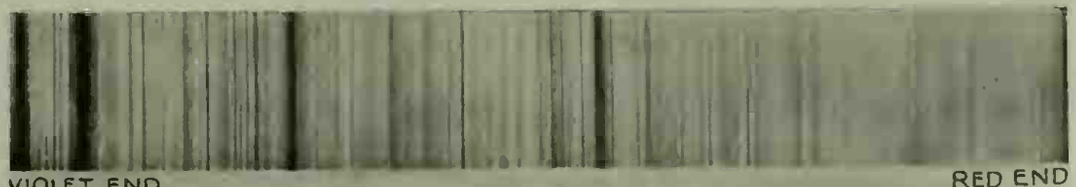
already in print. The great value to astronomy of this monumental work, which was undertaken and completed under the personal direction and supervision of the noted director, Prof. E. C. Pickering, just deceased, can hardly be overestimated. This detailed classification of star spectra shows forcibly that *evolution* is in progress among the stars. As to the exact order in which the evolution is taking place, there is still some doubt, but of the gradual transition from type to type in whatever order the evolution is progressing there can be no doubt. According to the classification of Father Secchi, which is useful for quick and approximate classification, the stars are divided into four classes or types. To Type I belong all the *bluish white or white* helium and hydrogen stars. These stars are believed to be the hottest of all the stars, and their atmospheres consist almost entirely of helium and hydrogen gases. To this class belong the Orion (helium) and Sirian (hydrogen) stars such as Rigel, Sirius and Vega.

Type II consists of the solar stars *yellow or orange* in color, whose spectra are dominated by the absorption lines of hydrogen and the metallic elements. They are generally considered to be lower in temperature than type I stars, and their atmospheres are denser and more extensive and filled with the vapors of many elements. The sun is a star of this type, and to this type also belongs such first-magnitude stars as Capella, Arcturus and Aldebaran. Type III consists of late type stars with banded or fluted spectra due to the presence of metallic compounds, chiefly of titanium oxide which appears to dominate the spectra of stars of this type and indicates a cooler atmosphere than exists in the earlier type stars, since compounds of the elements can only form at comparatively low temperatures. The absorption is strong in the violet end of the spectra of such stars, therefore they are *deeply reddish* in tinge. Antares and Betelgeuse are noted first magnitude stars of this class. Type IV consists of *deep red* stars, whose spectra are also banded or fluted, but the bands are due in this case to compounds of carbon. Their relation to the other types is somewhat uncertain, but they are believed to be connected with solar type stars by a chain of development independent of stars of the third type. That is, some solar stars develop into type III stars, others into type IV stars. Stars of this latter class are all very faint and very distant. It is believed that they are giant stars in absolute magnitude, their faintness being due to great distance.



The Harvard classification is much more complete than the above. It rests upon the behavior of certain groups of lines that vary in intensity as the evolution progresses. It also assumes that the evolution of the stars starts from the gaseous nebulae and is in the direction of the late type red stars.

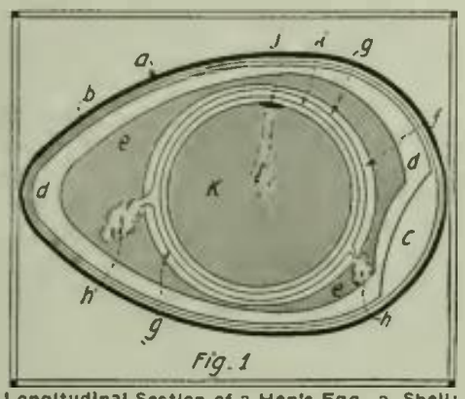
The spectra of the gaseous nebulae consists of bright lines of helium, hydrogen and nebulium upon a dark background. They are therefore true incandescent gases under low pressure. The first link connecting the nebulae with the stars appears to be the bright-line stars not recognized in the Secchi classification. They are referred to as the type O or Wolf Rayet stars in the Harvard notations, and their spectra show a faint continuous background (implying the formation of a central core) crost by a group of bright bands and a series of bright lines, both unknown terrestrially for a long time but finally obtained experimentally by passing a strong condensed discharge thru a mixture of hydrogen and helium in a vacuum tube. The ordinary well known hydrogen series also appears in this type, first as bright lines, but as the type progresses the bright bands and bright lines of both series become dark showing the formation of an atmosphere of cooler hydrogen and helium around the star. With the total disappearance of the bright lines and bands and the strengthening of the dark lines of helium and hydrogen, type O passes over into type B, to which belongs the beautiful blue white helium stars often called Orion stars because so many stars of this constellation are of this type. These stars have the hottest temperature and the rarest atmospheres of all the stars. The only absorption lines prominent are those of helium and hydrogen. There are a number of subdivisions of this type depending upon the relative intensity of the lines of the two gases. Toward the end of the type the hydrogen lines have become more intense than the helium lines, and faint metallic lines have begun to appear until by gradual transitions the hydrogen stars appear known as type A, or Sirian stars, after Sirius, a noted star of this type. The helium lines are now entirely gone and the spectrum of the star is entirely dominated by intense absorption lines of hydrogen. Four strong lines of this element exist in the visible spectrum (see diagram I) and the series extends rythmically far into the ultra-violet. These stars are intense white in color and their atmospheres are composed almost entirely of incandescent hydrogen. As the type progresses the faint metallic lines of the solar spectrum become stronger. The hydrogen lines reach their maximum strength in class A. (See photo of early type stars.) The next type to appear is known as the Calcium or type F group of stars which is characterized by the growing intensity of the lines of the metallic elements, which are now closely packed together in the spectrum, and by the very marked intensity of the calcium bands in the extreme violet and the continued great strength of the hydrogen lines which surpass any of the metallic lines in intensity. (See photo of type F star Procyon). To this class belongs



(Continued on page 157)

2. Alpha Tauri (Aldebaran) Advanced Solar-Type K5. Note: The Comparison Spectrum Shown Above is That of Titanium. The Spectrum of the Star is Superimposed Upon the Comparison Spectrum. Note in Above Spectra the Great Intensity of the Lines of the Metallic Elements Which in the More Advanced Types Have Become Stronger Than the Absorption Lines of Hydrogen Which Dominated the Spectra of Earlier Type Stars. As the Absorption Lines of the Metallic Elements Increase in Intensity the Color of the Star Becomes More and More Tinged With Red. Solar Type Stars Are Cooler (Superficially At Least) and Have Denser Atmospheres Than Stars of Type I (Helium and Hydrogen Type Stars).

Secchi's Type III, Harvard Type M Star. This Class Is Divided Into Giant (Type Ma) Stars and Dwarf (Type Mb) Stars—Color, Deep Red. The Spectrum Shown Is That of a Typical Giant (Ma) Star of This Class—Betelgeuse or Alpha Orionis. The Portion of the Spectrum Shown Is in the Blue Region. Note the Heavy Absorption in This Portion of the Spectrum and the Fluted or Banded Appearance Due to the Presence of Compounds of Titanium Oxide (Characteristic Also of Sun Spots and Indicating Comparatively Low Temperature). The Heavy Absorption of the Blue Rays Gives These Stars Their Deep Reddish Color. The Bands or Flutings Are Sharp Toward the Violet and Shade Away Toward the Red. There Is a Fourth Class of Stars Known As Type IV, Harvard Type N or Carbon Stars, In Which the Direction of the Shadings Is Reversed. These Stars Are Also Very Deep Red, Few In Number and Very Distant, the Brightest Known Being Only a Fifth Magnitude Star.



Spectrum of a Calcium or Harvard Type F Star—Alpha Canis Minoris (Procyon) Intermediate Between Secchi's Type I and Type II Stars. Color White Tinged with Yellow. The Portion of the Spectrum shown Runs From the Blue Green At the Right to the Extreme Violet At the Left. The Two Dark Bands At the Extreme Left Are the Strong Absorption Bands of Calcium So Prominent in This Type. The Other Three Dark Lines Are Absorption Lines of Hydrogen. A Fourth Line of Hydrogen Is Also Present So Close to the Second Calcium Band That They Appear Practically As One Band. The Metallic Lines Now Appear Closely Packed Together and of Growing Intensity. This Type of Star Is Dominated by the Absorption Bands of Calcium and the Absorption Lines of Hydrogen Which Are Stronger Than Any of the Metallic Lines.

Practical Chemical Experiments

By ALBERT W. WILSDON

FEW of the millions of people who eat eggs daily are familiar with, and in most cases never concern themselves with the chemical or physiological properties of this form of food. The daily consumption of eggs thruout the world is truly enormous, and the

Longitudinal Section of a Hen's Egg. a, Shell; b, Double Membrane of Shell; c, Air-Chamber; d, Outer, or Fluid Albuminous Layer; e, Thick, Middle Albuminous Layer; f, Inner Albuminous Layer; g, Membrane of the Chalaza; hh, the Chalaza; i, Vitelline Membrane; j, Germ; k, Yolk; l, Latebra. (After Macé.)

present high prices have caused many dealers to preserve eggs till the market is at a high point and then unload them, in many cases with the representation that they are *strictly fresh!* Eggs contain a relatively large proportion of *Proteid* and mineral matter which is used to furnish the salts of the bones, especially calcium phosphate, and also fat, and is one of the most concentrated forms of nutriment.

Proteids serve as a fuel for the body and also provide the important element Nitrogen, which is needed in the case of children for growth, and in the case of both children and grown people, to keep the body in repair.

Strange as it may seem, even eggs, the contents of which are contained in a brittle shell, have had substitutes placed upon the market in the guise of "egg substitutes." Nearly all these are claimed to contain all the ingredients of eggs, but most of them fall far short of these claims. There is a number of so-called *egg powders* offered for making cakes, etc., *which contain no egg at all.* They are composed of other forms of protein matter, usually casein from milk, and colored to resemble the egg in tint.

The average weight of a hen's egg is 60 grams, of which the shell weighs about 6 grams, the white 36 grams, and the yolk 18 grams. Roughly it contains 70% of water, 12% of albumin and 12% of fat.

The substance known as "white of egg" or egg albumin, when separated from the yolk, membrane and shell is a colorless, transparent, thick, sticky fluid, soluble in or miscible with water and is composed almost entirely of albumin, partially dissolved in water.

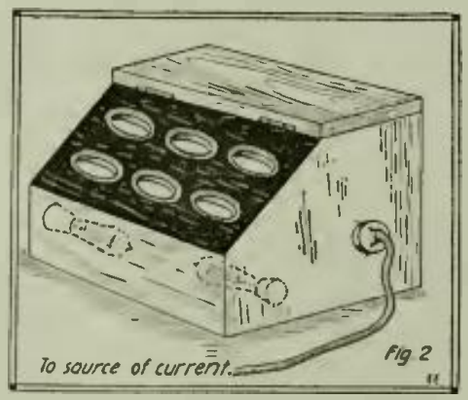
When the white of an egg is put into boiling water it undergoes a remarkable change, and is said to have *coagulated.* In this state it is insoluble in water and opaque and forms a solid mass, which, however, still contains a large proportion of water. During coagulation it is probable that chemical as well as physical changes have occurred. Thus from the foregoing we see that the white of egg is an extremely unstable and complex substance, its physical properties being so indefinite that it would be almost impossible to say that it was or it was not a definite chemical compound.

Eggs: Their Preservation and Tests

White of egg or egg albumin may, however, be taken as the representative of a group of substances which are classified together as the *Proteids*, or *Albuminoids.* They contain the five elements, Carbon, Hydrogen, Oxygen, Nitrogen and Sulfur.

Egg yolk is composed of albumin, fat, and a phosphorus bearing material of high nutritive value known as *Lecithin.* The yolk of an egg is a much richer food product than the white, containing in addition to the nitrogenous element the fat and mineral bodies necessary to nutrition.

PRESERVATION. Of particular interest to the reader will most likely be the methods of preserving and tests.



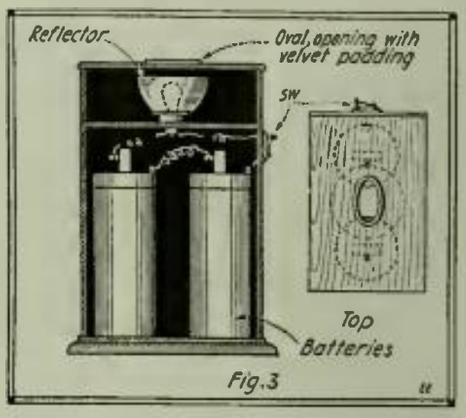
Owing to the porous nature of the shell, the moisture of the contents gradually grows less by evaporation, and the egg loses in weight. Air also passes in thru the shell pores, carrying various microbes, which result in ultimate decomposition and spoiling of the egg. Nature has provided the shell with a thin surface coating of mucilaginous matter, which, however, is easily washed off. This coating tends to partially close the pores, and for best results in keeping should not be removed by washing.

By coating the eggs artificially with a varnish or film of some kind the egg will be rendered impervious to air and water. One of the cheapest, simplest and best of these coatings is *Water-glass.* This is produced by dissolving the substance known as Sodium Silicat (or Silicat of Soda) in water, and applying the same, by dipping the egg into the solution and removing and allowing to dry. The Silicat of Soda which is thus left in a thin film over the surface of the egg penetrates and stops the pores and renders the egg-shell practically impervious both to air and water. This material possesses the property of becoming totally insoluble in water when it has once been dried so that even if the egg is afterwards subjected to contact with water the film is not removed.

One drawback to this method is that eggs so treated break more easily on boiling. This breakage may be prevented by carefully piercing the shell with a strong needle before being put into the water.

Gelatine, vaseline, wax or gum are other substances used for coating or varnishing the egg, tho they are not as efficacious as the water-glass.

Another proposed method is to immerse the eggs in boiling water for twenty seconds with the result that a very thin layer of the egg-white next to the shell becomes



A 110-Volt Two-Lamp Egg Candling Cabinet with a Capacity of Six Eggs. It Can Be Easily Built by Anyone or Purchased as Desired.

coagulated, thus forming an impervious coating *inside the shell.*

PHYSICAL EXAMINATION OF EGGS. Various physical tests have been prescribed for ascertaining the approximate age of an egg.

THE SALT SOLUTION TEST consists of

Battery Type of Egg Candling or Testing Cabinet Which Anyone Handy with Tools Can Easily Construct. The Lamp and Reflector Can be Obtained at Any Supply Store.

placing the egg in a 10% salt solution. **If perfectly fresh, the egg will sink to the bottom. If it remains immersed in the liquid, it is to be considered at least three days old. If it rises to the surface and floats thereon, it is more than five days old.** This test is a rough one, is quickly applied, and will distinguish the really fresh egg from one which is even a few days old, but is useful only for eggs that have been kept in air. Preserved eggs cannot be gaged by these means. It is possible also to apply the sinking and floating tests on a large scale. Salt water tanks of any size may be easily constructed into which hundreds of dozens of eggs may be placed at one time, thus effecting a speedy separation of *sinkers* and *floaters*, and at a minimum expense. There are some instances where a fresh egg will not sink in these circumstances, but such cases are not numerous enough to be of any importance.

CANDLING TEST. The best method of examining eggs for freshness is *"candling,"* the process consisting in placing the egg between a bright light and the eye. **If the egg is fresh it will show a uniform rose-colored tint, without dark spots.** Moreover, there is to be found in the larger end of a fresh egg, between the shell and the lining membrane, a small air cell, occupying *one-twentieth* of the capacity of the egg, which is distinctly transparent. *In an egg which is not perfectly fresh this space, unless the egg is stored with the large end up, becomes filled with egg substances and presents the same appearance as the rest of the egg. If dark spots are found in the egg, it is certain that the egg is not perfectly fresh, and its appearance will be more or less cloudy, being darker as the eggs grow older, becoming in extreme cases opaque.* At the same time the "air chambers" mentioned before grow larger as the age increases. The so-called *"spots"* are eggs which show on "candling" black patches due to fungi.

The best of all tests, however, is to open an egg and examine its general appearance, its mobility, and its odor and taste. Eggs which have been stored some time show a tendency in the white and yolk to run together, and when this phenomenon is observed it may be certain that the egg is not a fresh one, altho no perceptible odor of

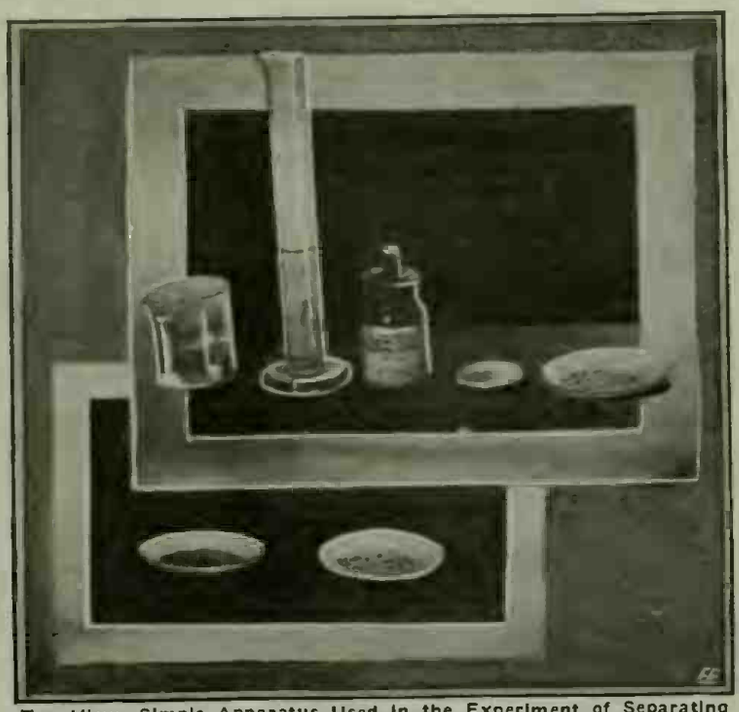
Experiments in Radio-Activity



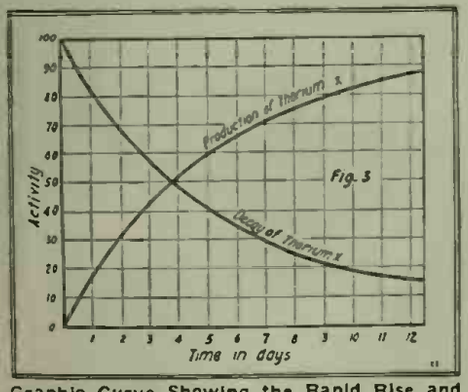
By IVAN CRAWFORD

PART IV (Conclusion)

IN the previous installments of this series the properties of the radiations from radio-active substances have been discust. It is the author's intention in this article to explain the radio-active transformations and to show that in reality *these changes are a transmutation of the elements.* Experiments will be given showing the rise and decay of the active constituents. For a more detailed account the reader is referred to Sir Ernest Rutherford's "Radio-active Substances and Their Radiations."

The disintegration theory was first proposed to account for the continuous production of thorium X from thorium compounds. This change from thorium to thorium X is in reality a breaking down of the thorium atom which has an atomic weight of 232, and the formation of the thorium X atom which has an atomic weight of 224. This is accomplished by the emission of two alpha particles. There are, however, two intermediary products, namely, mesothorium and radiothorium. Radiothorium is, however, chemically inseparable from thorium and mesothorium inseparable from thorium X, and are in reality isotopes. The word isotopes is used to designate two substances which have the same chemical properties, but different atomic weights. The rate of decay of an active substance may be calculated by using the formula given in the second article for the retardation of alpha particles. In this case I_e is the initial activity, I_t is the activity after time t, e is the base of the Naperian logarithms (2.7182), and λ in the case of thorium X is .19 days. Using this equation the decay curve may be plotted. The two assumptions of the disintegration hypothesis as given by Rutherford are: (1) that there is a constant production of fresh radio-active matter by a radio-active substance, and (2) that the activity of the matter so formed decreases according to an exponential law with the time from the moment of its formation.

An experiment proving the disintegration hypothesis will now be given. About 5 grams of thorium nitrat or some other thorium salt are dissolved in water. This solution should be left standing for about 2 days for reasons which will be given later. The thorium nitrat solution is then diluted to about 200 c.c. The solution should be heated and ammonia added in excess. The thorium and some impurities are precipitated as a hydroxid by the ammonia. The thorium X, however, remains in the solution with the mesothorium. The solution is now filtered and the precipitat dried for future use. The filtrate should be boiled down to dryness to remove all traces of the ammonia salts. The residue contains the thorium X. The solution when concentrated should be transferred to a watch-glass and dried upon it to facilitate handling. In the accompanying illustrations the apparatus necessary to perform these separations is clearly shown.



Top View—Simple Apparatus Used in the Experiment of Separating Thorium "X" from Thorium Nitrate. This Experiment Proves the Hypothesis of Radio-active Transformation or the Transmutation of the Elements. Lower View—Watch Glasses Used to Hold Thorium "X."

The reason for letting the thorium nitrat solution stand several days before using had now better be explained. Thorium compounds have been found to give off an active gas known as *thorium emanation.* This emanation when it decays forms an active deposit. In salts this deposit is always present as the emanation is occluded in the solid, and allowed to change into the deposit. This deposit, however, decays in a short time. If the thorium solution were used fresh, the thorium X would contain some of this active deposit, thus causing an initial rise in activity instead of a gradual fall. When the solution is allowed to stand for several days the amount of active deposit remaining is negligible. No more is formed, as the emanation escapes from the open vessel not being held by the solution.

The watch glass or metal plate having the thorium X deposited upon it is now introduced into the radio-active electroscope. The rate of discharge is then noted as outlined in the first article. The activity should then be measured every 12 hours for about 12 days, and the results tabulated. These figures then are the measure of the decay of the thorium X at different periods. These figures may be compared with those calculated by using the equation given in the second article. The results should now be plotted on a graph.

The plotting of the decay curves of active substances is extremely simple, the ordinates represent the activities as determined by means of the ionization current, and the abscissae represent the time in days. In arranging the graph the lower abscissa should be divided into 12 divisions to represent the 12 days in this experiment. The ordinate to the left is divided into 10 parts to represent the change in activity. The initial activity is denoted by 10 and the other activities arranged proportionally on the ordinate. The activity, then, for each half day is marked on the graph by a small circle or dot. A curve joining these circles represents the decay curve of thorium X. Irregularities at the beginning may be caused by the active deposits remaining in the solution.

The thorium nitrat or hydroxid as it is after the chemical reaction can be measured in the same way as the thorium X. It will be found that the thorium hydroxid increases in activity due to the production of thorium X. The curve denoting the rise in activity of the thorium salt is the exact complement of the curve of thorium X. Two such curves are shown in the accompanying graph. They illustrate the theoretical decay and production of thorium X. This experiment shows conclusively that it is possible for one substance to change into another. If this transmutation could be controlled the goal for which alchemists sought would be realized. In this experiment the thorium gives rise to an active substance several thousand times as active, weight for weight, than the thorium from which it was separated.

Graphic Curve Showing the Rapid Rise and Decay Periods of Thorium "X," in Days, as Well as the Relative Activity. The Decay Is Measurable by Means of the Sensitive Electroscope Previously Described.

As the reader goes deeper into the study of radio-activity the question may sometimes occur to him whether or not the property known as radio-activity is limited to a certain group of substances such as have been described here. This question has occurred to several scientists and has been met with various answers. It is, however, merely a subject for speculation, as it is impossible to secure any conclusive experimental evidence. The reason for this is apparent, as the rate at which they would give off rays is so small and their lives so long that they would have to be observed over millions of years to detect any visible change.

Radio-active compounds are being used more and more in modern every-day life. What was at first merely a peculiar phenomena is now an important branch of science. Prominent scientific magazines and institutions are now regarding radio-activity as a separate and distinct science. Large laboratories have been established for the study of this phenomena. Thousands of dollars have been spent in the establishing and equipping of factories for the extraction of uranium and radium from the carnotite. It has found extensive use in large hospitals for the cure and treatment of cancers and skin diseases. This line of research should appeal to every experimenter of the present day. It has given

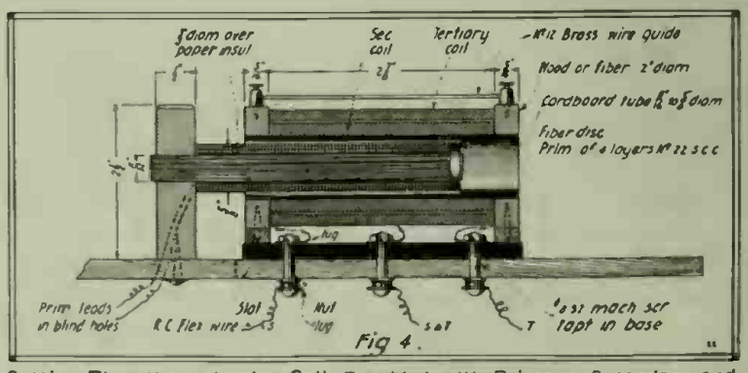
THE CONSTRUCTOR

How to Build an Efficient Medical Coil Set

By H. WINFIELD SECOR

Appearance of Finished Medical Coil Set in Carrying Case as Built by the Writer. This Coil Is Adapted to All Kinds of Testing Work, Besides the Treatment of Various Bodily Ills, Such as Rheumatism. The Primary, Secondary or Tertiary Current and Combinations of Them Are Controlled by a Double-Pole Switch.



THE aim of this article is to give the constructional details so that anyone interested in shocking or medical coils may build his own apparatus at a slight cost. The outfit will produce equally as good results as any of the commercial apparatus, for all usual requirements. Medical coils are widely used for the treatment of rheumatism and other bodily ills and pains, besides furnishing lots of amusement and fun for the young folks. Not only this, but such a coil as the one here described lends itself very well to many kinds of testing, and it also can be used for telegraphing along railroad tracks for several miles, after the manner of the U. S. Signal Corps buzzer sets. We will take up the construction of the individual parts of the apparatus in detail.

Induction Coil.

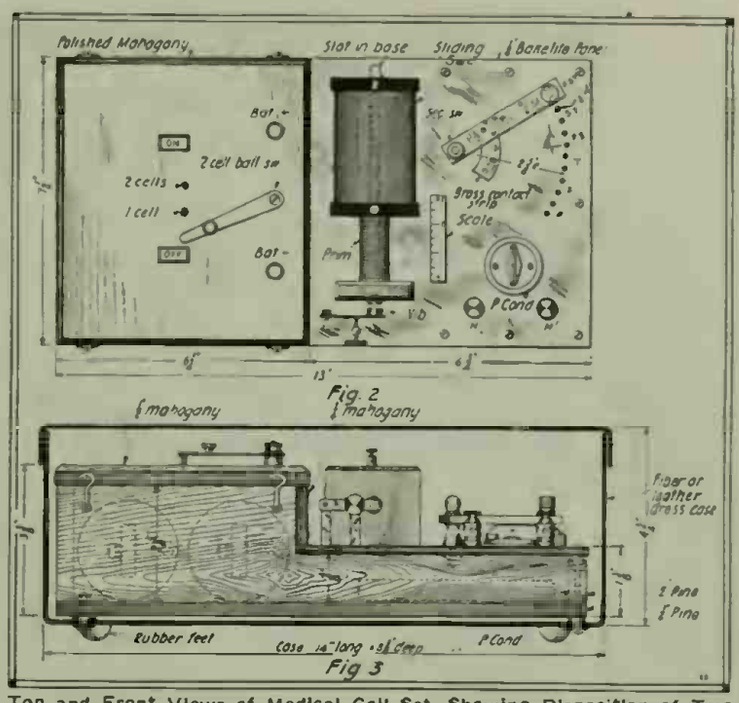
The induction coil used in the present apparatus need not be as carefully insulated and constructed as that intended for producing sparks with corresponding high potentials, which constantly tend to break down the insulation between turns and between layers of wire. As the detail drawings show, the usual secondary coil is supplemented by a second fine wire winding, known as the *tertiary*, which is wound exterior to the usual secondary winding. The primary winding and the annealed soft iron wire core is mounted rigidly in a stationary block, made of mahogany or other hard wood, or else it may be cut out from a piece of black fiber, bakelite or hard rubber, whichever may be the handiest material for the builder. This primary supporting block has a hole drilled thru it, having a diameter of 11/32 inch, in which the iron wire core is to be emplaced. To make the core, you will require the softest iron wire you can procure, about No. 22 to 24 gage, measuring about 4 inches in length. The wires should be as straight as possible, and they are mounted in the upright block by placing as many of them thru the block as you can, gradually increasing the number in the hole by sticking some here and there around the outside and in the center, until as many wires are in the bundle as you can push in thru the hole. The core may be finally tightened up by driving a few small brads thru the front end and clipping these off with a pair of pliers. Afterward this core face against which the vibrator is to operate is filed off smooth, but left projecting from the block about ⅛ inch.

The next step is to insulate the long leg of the core projecting from the block, and this is done by winding some thin linen or silk tape along the core, lapping the tape slightly. A daub of glue or a piece of thread will hold the final convolution of tape. The block should previously have had two 1/16-inch holes drilled up from the base with a hand drill or drill press, thru which the two primary leads may pass without being seen. After passing thru one of the primary leads, so as to leave about 6 inches projecting and then coiled out of the way, we may proceed to wind the first layer of the primary. This is wound as evenly as possible, and, in all, four layers of the primary wire (No. 22 S. C. C. or enamel magnet wire) are put on, bringing out the final lead from the fourth layer thru the remaining hole in the upright. This coil may then be immersed in molten paraffin wax, or it may be given a coat of thin orange shellac. To give a finished appearance, a layer of black paper may be glued around it.

The secondary and tertiary coils are wound on the bobbin, as shown in Fig. 4, a wrapping of three layers of paper being placed between them. In winding the layers of these two coils, the length of the layer is made a little shorter than the bobbin, leaving a space of about ⅛ inch at each end, and a layer of thin paper, preferably paraffined paper, is placed between every layer. The size of wire for these two coils is No. 36 B. & S. gage, S. C. C. or enameled insulation. In bringing out the leads from this fine wire, it is the best practise never to rely on a single strand of this small size, which may easily break and cause no end of trouble; therefore several strands of

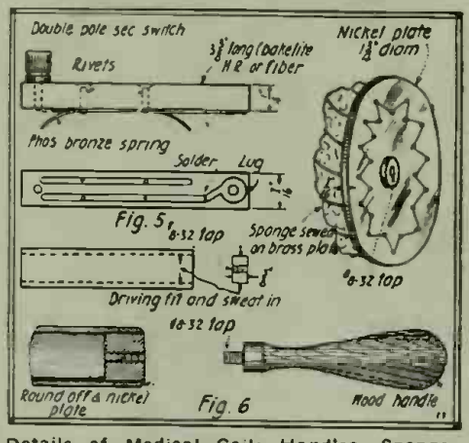
Section Thru the Induction Coil, Provided with Primary, Secondary and Tertiary Windings. The Tertiary Coil Is Wound Outside the Secondary and Yields a Mild Current, Very Desirable in Electro-Medical Applications.

www.americanradiohistory.com



the wire should be doubled up to form a sturdy flexible lead, which should be given one or two wraps around the form and tied with a piece of thread. The fine wire forming the winding is then soldered to this heavier lead. A small winding jig, comprising two wooden uprights mounted on a base together with a piece of heavy iron wire, bent so as to form a handle or crank, and a piece of round wood such as a piece of shade roller, will serve to support the secondary bobbin while it is being wound. Proceed to wind on ten layers of the specified wire for the secondary, insulating each layer from the other by a wrapping of paraffined or other paper (but not newspaper) and when the ten layers have been wound on, the joint or common lead shown in Fig. 1 should then be put in place and the wire soldered to it. After winding three layers of paraffined paper around this coil we may proceed with the winding of the *tertiary*, or third coil, which comprises eight layers of wire, each layer separated by a wrapping of paper between. The third or outer lead, coming from the free end of the tertiary winding, completes this unit, and the coil may be finished with a few wrappings of stiff paper to protect it and give it a smooth cylindrical form. The finishing coat may be a wrapping of thin hard rubber, or simply some black paper, which may be later varnished or coated with some black shellac to correspond with the bobbin ends, as the builder may desire.

The induction coil is clearly illustrated in section by the diagram in Fig. 4, and the method of carrying the three connections from the secondary and tertiary windings is simple and efficient. Instead of the older method of providing sliding shoes and metallic rails, the writer has found it much simpler and more reliable, with no chance of intermittent makes and breaks in the current applied to the patient, to secure the three leads coming from the coils to three 8-32 machine screws threaded thru the fiber or bakelite base of the coil in the manner shown. The secondary unit, as will be perceived, is permitted to slide back and forth by virtue of the slot cut thru the wooden base of the cabinet as disclosed in Fig. 2. Three rubber-covered stranded leads such as lamp cord are firmly soldered to three lugs, clamped against the heads of these machine screws by nuts under the base, as shown. It is well to place a metal washer behind the nut, and the screws are then past thru the slot in the cabinet base and screwed into the bakelite base supporting the coil. The secondary and tertiary leads are preferably soldered to three metal lugs



Switch Details.

There are several switches used on this medical coil outfit. (The condenser and switch are optional, and are used mostly for producing a very strong current for shocking purposes.) There are also provided a three-point lever switch for the three positions of "off," "one cell" and "two cells" of dry battery, and a special *bi-polar* secondary switch.

The only special part which needs explanation in detail is the bi-polar secondary switch, and this is illustrated in detail in Fig. 5. The lever of this switch may

Top and Front Views of Medical Coil Set, Showing Disposition of Two Dry Cells. It Works Very Efficiently on One Cell, as Proved by Tests. The Secondary Unit Is Movable.

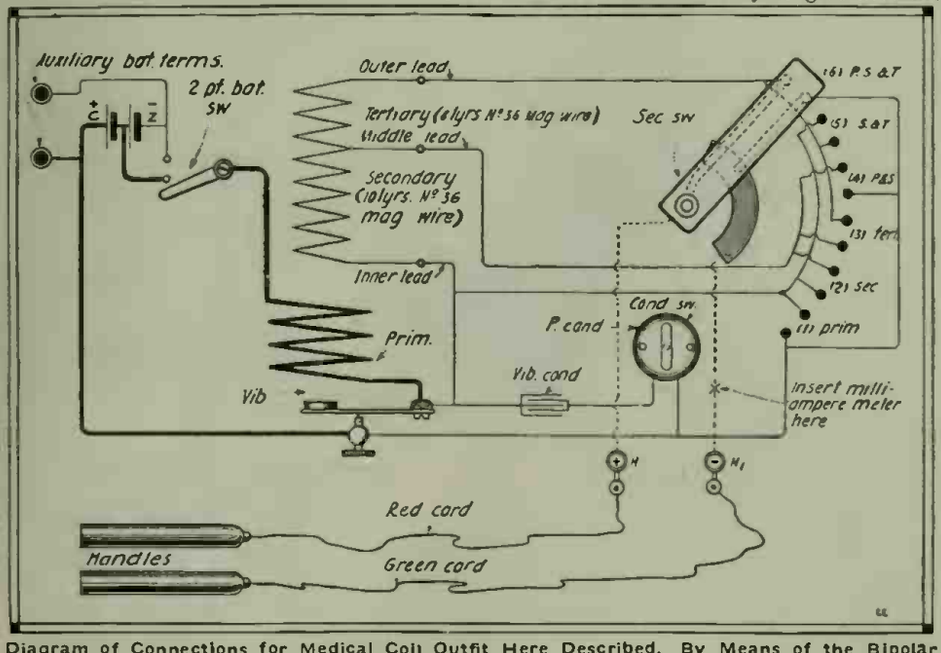
Details of Medical Coil: Handles, Sponge, Electrode and Bipolar Switch.

be made from a piece of ¼x½-inch bakelite, hard rubber or fiber, preferably black in color. It is not necessary to give here the fractional dimensions for the phosphor bronze contact springs, as their size may be judged from the drawings, and each constructor will make these a little different possibly. They should in any case be approximately ⅛ inch in width and spaced 3/16 inch apart, so as to give as high insulation as possible between them. One of these springs remains flat at the rear, and is soldered to a brass lug, so as to be connected with the central supporting posts of the switch lever in the manner apparent. The second spring bends downward at the rear, and makes contact with an insulated brass segment, shown at Fig. 2, and which forms the second pole of this switch. The necessity of this switch will be evident from the diagram of connections, Fig. 1. The springs on the secondary switch may be of phosphor bronze, German silver, or hard springy brass, and can be quite light.

The secondary current distributing switch gives six different forms of current, namely, primary—secondary—tertiary—primary and secondary—secondary and tertiary—primary, secondary and tertiary—and therefore requires twelve contact points, which are spaced 11/32 inch apart.

Vibrator.

The vibrator is best removed from some cheap medical coil, or else made up by removing the armature spring from a buzzer or bell, which already has a platinum or silver contact mounted in the end of the spring. The vibrator contact screw and spring are supported on two round brass uprights, threaded for machine screws at the base, these uprights being made of about ¼-inch diameter stock. The spring should be about ¼ inch wide and fairly thin. It may be of steel, spring brass, phosphor bronze or German silver. The contact points, that on the spring and the point in the end of the vibrator adjusting screw, are preferably formed of small platinum points, or they may be the new tungsten points. Silver is frequently used, altho it is not very commendable for the purpose. These contact points are generally obtained from old bells or other electrical apparatus. The iron armature on the end of the vibrator spring, for use with this form of coil, should be about 5/16 inch in diameter and ⅛ inch thick. It may be riveted or soldered to the vibrator spring. It should be mounted so that the armature normally is about 3/32 inch from the iron core. (*Continued on page* 150)



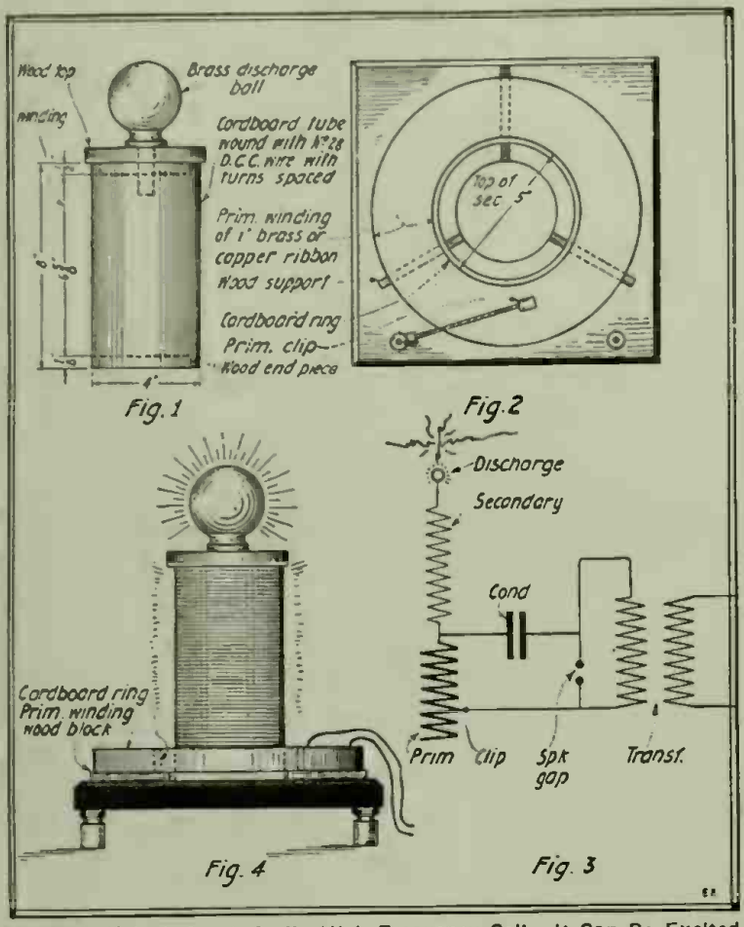


Diagram of Connections for Medical Coil Outfit Here Described. By Means of the Bipolar Current Controller any Modification of Primary, Secondary or Tertiary Current Is at Once Available.

www.americanradiohistory.com

A Small High Frequency "Oudin" Coil

An 8- to 10-Inch Spark Oudin High Frequency Coil. It Can Be Excited by a One-quarter K. W. Step-up Radio Transformer or 6- to 8-Inch Spark Coil.

The high frequency transformer here described is of the *Oudin* type. All that is necessary to use in conjunction with it are a small wireless transformer or spark coil, a high potential condenser, and spark gap. The discharge obtained when the coil is excited by a ¼ K.W. transformer will be from nine to twelve inches in length, while the spray discharges will reach out to still greater lengths. The results obtained with this small coil will thoroly repay the builder for the few hours spent in the construction of this simple, yet intensely interesting piece of apparatus.

The secondary of the transformer is shown in Fig. 1. The cardboard tube, upon which the wire is wound, might well be a round "Quaker Oats" box cut to length. It should be well shellacked inside and out, so as to keep out the moisture. Two wooden ends should be turned or sawed out, and for the sake of appearance should be nicely stained and varnished. A discarded ball from a brass bed will be found to suit very well for a discharger. The wire for the secondary should be numbers 28 to 30 B. & S. D.C.C. or S.S.C. wire. The winding must be done on a lathe or else on a simple winding rig, as it cannot be evenly wound by hand. The turns are separated with a thread wound on with the wire. After the wire and thread are wound, the whole should be given two or three liberal coats of shellac (or better, "armalac"). The upper end of the winding should be fastened to the brass discharge ball. This finishes the secondary coil.

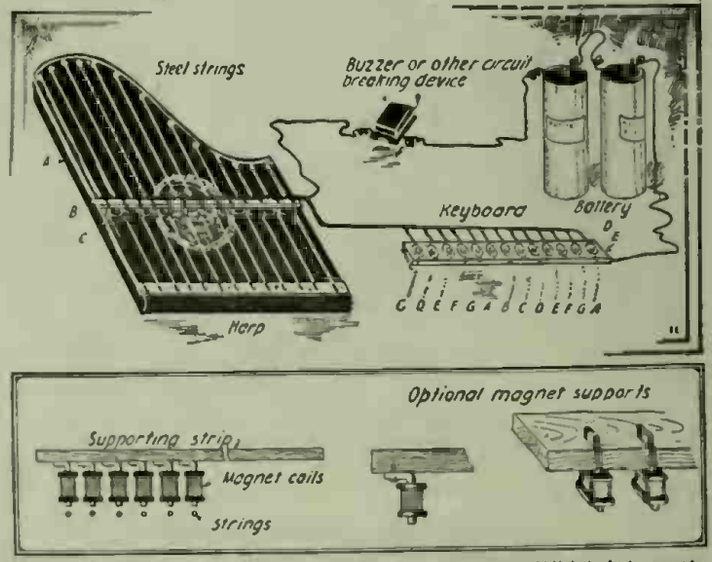
The primary is very easily constructed. It is made of one-inch copper or brass ribbon. The inside turn is taped to a cardboard ring, about 5 in. in diameter, and one inch high. This is shown in Fig. 2. The ribbon should be wound tightly, the turns separated by thin corrugated paper, such as used in packing boxes. The strip of paper should be about ⅝ inch wide, so as to allow sufficient surface of the ribbon exposed to make a variable contact with the helix clip. After nine or ten turns have been wound, the spiral should be tightened and taped on the outside. This makes a quite firm winding. The inside turn is connected to the lowest turn of the secondary, see diagram Fig. 3. Also a wire is led from this connection to one binding post. The clip is connected to the other post by a piece of high tension cable. The primary rests on wood supports, which may be of any convenient size. The base should be of ¾ in. wood, and 11 inches square. The edges should be beveled. Porcelain knobs are glued under the corners by means of wooden dowels inserted into the base, as shown at Fig. 4. The complete hoop-up is shown at Fig. 3. Fig. 4 shows the transformer assembled. In operation, the clip should be moved from turn to turn, until the best discharge is obtained. It might be well to say that the current from the secondary is of such high frequency that it is entirely harmless when taken thru the body, providing the spark is allowed to jump to a piece of metal held in the hand, and not to the skin direct.

Contributed by G. W. COOKE.

An Electro Harp

[*The idea here described and illustrated is the "germ" of the marvelous electrically played "choralcello"—the piano that gives absolutely pure music, owing to the fact that the strings are set into vibration by electro-magnets, not by striking them with mechanical hammers, as in the ordinary piano. With such electrically played instruments it is possible to produce "sustained" notes of wonderful purity. Those interested in this work will find that each string must be vibrated by its own magnet coil, and each coil excited by an alternating or pulsating current having a periodicity corresponding to the natural frequency of the particular string played. A buzzer specially tuned for each string may be experimented with.—Editorial note.*]

Any one possessing a harp or zither and a few odds and ends to be found around any amateur work-shop, may make a most pleasing and interesting instrument.



As shown in the accompanying drawing A, is an ordinary harp having steel strings. B is a wood or fiber strip on which the required number of electro-magnets, C are mounted: i. e., as many magnets as there are strings on the harp. These are suspended so as to cover, but *not touch*, the steel strings. Suitable electro-magnets are made from telephone receiver pole-pieces, which can be purchased from any supply house. A corresponding number of push buttons D, are arranged on a separate board E, serving as a key-board. The push buttons D, are lettered according to the strings they control.

The connections are as shown, each magnet being placed in series with its push-button. The other terminals of the magnets and buttons being connected, the main wires are led to a buzzer or other interrupting device F, and batteries G.

It is a good idea to construct a special keyboard, as the push-buttons cannot be played very fast. Pivoted or spring-supported strips arranged side by side can easily be assembled on a base-board, with suitable contact points mounted under each "key" strip. These contacts can be made from silver wire, platinum points off old bells or buzzers, tungsten points, or for that matter just plain brass points or springs. The smooth action of such a hand-made keyboard will really surprise you.

The instrument can be used as an ordinary piano, pressing the buttons as if they were keys.

Experimental Mechanics

By SAMUEL D. COHEN

LESSON XII.

IN the last lesson we considered the theory of twist drills, and having this in mind, we shall now discuss the practical end of the twist drill. It is essential to note that in grinding twist drills it is very important to have the cutting edge

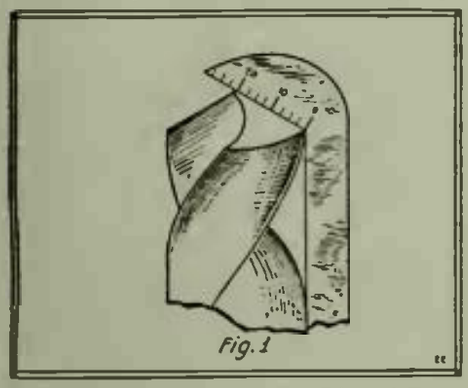

Fig. 1

Using Grinding Gage to Test Edge of Twist Drill When Sharpening It.

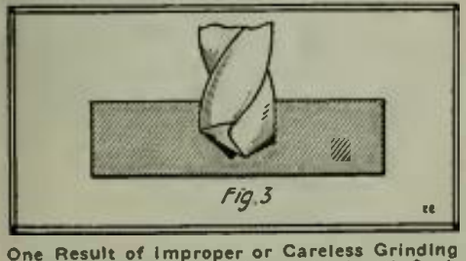
at the proper angle, otherwise the drill will not cut—or it may dig into the metal, thus spoiling the same or breaking the drill. The best angle at which the cutting edge should be ground is that of 59 degrees. A gage is usually provided for determining whether the cutting edge is ground to the required angle. Fig. 1 shows the gage being used for that purpose. This gage is a standard tool, and should be found in every experimenter's tool kit.

To acquire knowledge on how to actually grind a drill by reading, is a very difficult matter for the beginner. This is a subject which he must learn by actual practise, thus gaining experience as to the manner in which the drill is held against the abrasive (grindstone or usually an emery wheel), also how to determine whether the drill is ground properly so that it can perform its necessary function.

It is advisable for the beginner to obtain a drill grinder, which can be purchased for a nominal sum. There are two kinds of drill grinders—first, that wherein the drill is controlled by hand, and the grinding of the two cutting edges is performed separately; the second type, wherein the drill is clamped and the grinding is performed automatically. The latter is used extensively in large factories, where considerable quantities of twist drills have to be ground.

The point in favor of the grinding machine is its independence with regard to the ability of the workman; also the grinding is accomplished much faster. Fig. 2 illustrates a hand-controlled, foot-operated grinding machine.

In using twist drills, it is of extreme importance to have the cutting edges properly ground. To illustrate this, the results obtained from careless and inexperienced



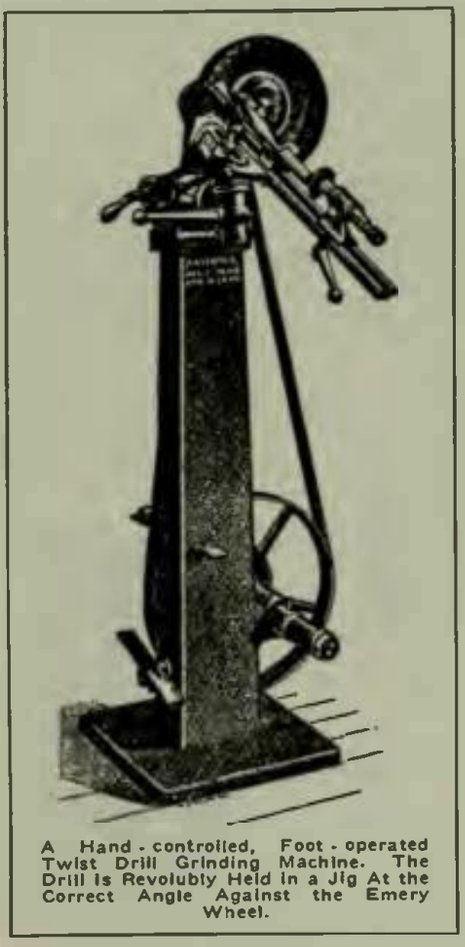


Fig. 3

One Result of Improper or Careless Grinding of a Twist Drill. The Hole Drilled with Such a Twist Drill Tends to be Ragged, Elliptical, and in Fact Most Any Shape But Round.

use of the free-hand twist drill are clearly depicted in Figs. 3, 4 and 5. The subject is of extreme importance, and the novice is strongly advised to procure a machine that will grind his drill to the proper cutting edge angle, thereby saving some important work that he may be engaged on, which might have been destroyed by the poor, hand-ground drill.

If the sharpening is done by a free hand drill, it is advisable to observe the cutting of the metal by the twist drill: first, the chips made by the cutting; second, the size of the hole. If the cutting lips are shaped to a proper clearance, the chips will curl as they start from the cutting edge, but, if the cutting lips lack a proper clearance, the resulting chips have the appearance of being ground off, rather than freely cut. If the cutting lips are of uneven length, the hole will be enlarged over the diameter of the drill.

The next important factor with reference to drills, is their feeding speed. In order to obtain best results with drills and drilling machines, the drill should advance

A Hand-controlled, Foot-operated Twist Drill Grinding Machine. The Drill is Revolubly Held in a Jig At the Correct Angle Against the Emery Wheel.

into the work a definitely regulated amount each revolution. The distance which the drill advances per revolution is termed the *feed*, and must be adjusted to suit the conditions under which the work is being performed. See table at end of article.

These figures are recommended for average conditions. At times they are greatly exceeded, and at others must be greatly reduced. Feeding the drill free hand, if skillfully done, may answer in certain cases, but is less effective than power feeds, with the exception of small wire drills.

The drill speed is another important factor when considering the successful operation of twist drills. This appertains to the surface or peripheral speed of the drill in feet per minute, and is rated at the outer diameter. Under average conditions, the

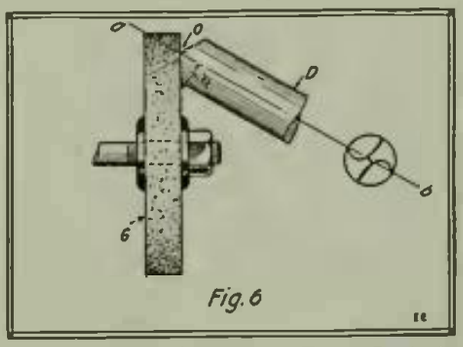

Fig. 6

In Grinding or Sharpening Twist Drills by Hand, Care Should Be Exercised to Keep the Drill Axis At An Angle of 60 Degrees with the Grinding Plane.

peripheral speed recommended for carbon steel drills is thirty to forty feet, and for high-speed drills, seventy to one hundred feet. Working conditions may at times cause a change in these figures. When the extreme outer corners of the cutting edges wear rapidly, it is evidence of too high a surface speed.

In order to grind a drill by hand, it is necessary that the axis of the drill be within 60 degrees of the grinding plane. This can be more clearly understood by referring to Fig. 6, where G is the grinding plane or grindstone, and a-b is the axis of the drill, D, to be ground. The cutting side of the drill should be kept at the required angle, $\Phi = 60$ degrees, with the grindstone surface. If now a revolving movement is made around the axis of its length toward the drill, a straight circular cone will be ground by the grinding wheel at the top, the axis of which coincides with D. If the drill is so ground that the following will be true, the drill will then perform its proper function, namely; that all the cutting lips have the same inclination to the axis of the drill; secondly, that the cutting lips be of exactly equal length; thirdly, a proper lip clearance of the surface back of the cutting edge; fourth, a proper angle of lip clearance.

In order to maintain high cutting speeds, it is necessary to use a lubricant. Those recommended below have stood the test of service.

For hard and refractory steel: Turpentine, kerosene or soda water.

Soft steel and wrought iron drilling: Lard oil or soda water.

Brass cutting: Paraffin oil.

For aluminum: Turpentine, kerosene or soda water.

Cast-iron work: Usually worked dry.

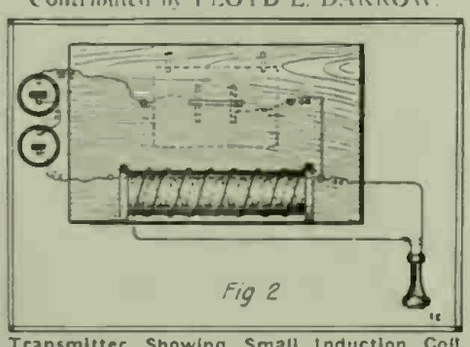
HOW-TO-MAKE-IT

This department will award the following monthly prizes: First Prize, $3.00; Second Prize, $2.00; Third Prize, $1.00.
The purpose of this department is to stimulate experimenters towards accomplishing new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best idea submitted a prize of $3.00 is awarded; for the second best idea a $2.00 prize, and for the third best prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings. Use only one side of sheet. Make sketches on separate sheets.

FIRST PRIZE, $3.00

TELEPHONE TRANSMITTER SENSITIVE AS A DICTAPHONE

A very simple, but wonderfully sensitive telephone transmitter for experimental purposes can easily be made. As shown in the



Here, ABCD = Piece of Soft Wood 5 x 3 x ¼ Inches Resting on Wooden Base. abcd = Wooden "Mouthpiece" Hanging on Back of Larger Piece and Carrying a Short Carbon Rod, ef. HK and LM = Carbon Rods Attached to the Larger Piece of Wood. Wires Lead from HK and LM Thru the Posts p and q and Two Dry Cells at R to the Standard 75 Ohm Telephone Receiver.

diagram Fig. 1, it consists of a small piece of thin board mounted on a wooden base and having two vertical carbons about 3/16 of an inch in diameter, attached by claw tacks to the back. Hanging over them is a small, thin piece of light, soft wood carrying a transverse carbon, which lightly touches the vertical ones. This constitutes the "mouthpiece." To the vertical carbons wires are attached which run through the board and connect with two dry cells and a telephone receiver. The transverse carbon resting against the vertical carbons makes a bad contact in the circuit, and the sound vibrations striking upon the *mouthpiece* produce an alternate increase and decrease in pressure, which varies the electrical resistance and current in the circuit.

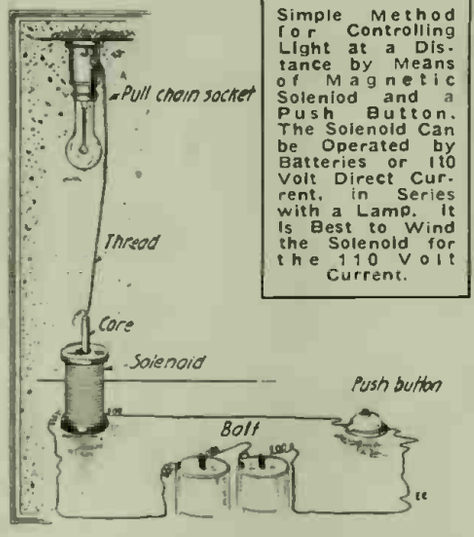
To secure greater sensitiveness a small induction coil may be mounted on the front, as shown in the second diagram, Fig. 2. A few turns of No. 22 copper wire are used on the primary, and a large number of turns of No. 36 wire on the secondary. With the induction coil inserted the human voice in ordinary conversation, six feet from the transmitter, is easily heard thru the receiver, which may be placed at any distance.

Contributed by FLOYD L. DARROW.

Transmitter Showing Small Induction Coil Mounted on the Front of the Board. The "Mouthpiece" Is In Series with the Primary Winding.

SECOND PRIZE, $2.00

CONTROLLING DISTANT LIGHT WITH A MAGNET.



It is often convenient to have a light at the head of the stairs so connected that it may be turned on at the bottom as you go up, and turned off when you reach the top, or vice versa. But it is not always practicable or desirable to have the old wiring taken out and new installed, for this purpose. The same results can be obtained by the use of the scheme herein shown.

A common pull chain socket is used with a thread attached to the end of the chain and to the top of the solenoid core, or the chain may be fastened direct to the core for that matter. The rest of the drawing requires no explanation.

One push can be at the top of the stairs and one at the bottom, and as many others at different places as the experimenter desires. One push of the button turns the light on and another turns it off.

Contributed by

SCOTT EUGENE VANCE.

Simple Method for Controlling Light at a Distance by Means of Magnetic Solenoid and a Push Button. The Solenoid Can be Operated by Batteries or 110 Volt Direct Current, in Series with a Lamp. It Is Best to Wind the Solenoid for the 110 Volt Current.

MAGNETIZED SCREW-DRIVER A HANDY DEVICE.

I magnetized a screw-driver by holding it close to a dynamo for a few minutes, nearly two years ago, and it is still my most valued helper when it is necessary for me to do repair work on my car. It is a great help when working around the car to have this magnetized screw-driver to pick up screws and small pieces of the machinery which drop down inside, out of my reach.

In setting screws it is invaluable; simply pick up the screw by touching the head with the magnetized screw-driver, and it may be instantly set in place with only one hand. It does away entirely with the annoyance of the screw slipping away and getting lost, as it so often does. I always carry it in the tool box, and find the other fellow appreciates it when I find him having car-troubles on some lonely bit of road.

THIRD PRIZE, $1.00

A QUICKLY CONSTRUCTED "PHONE CONNECTOR."

An efficient and handy "Phone Connector" can be made in a few minutes, as follows:

Obtain a spring clothes-pin; bore a hole

A Handy, Simple and Efficient 'Phone Connecting Clip. The Clip Is Clamped, on a Strip of Fiber, Lined on Either Side with Brass Strips as Shown.

thru head where line usually goes, put a battery binding post thru each hole, so that the nut will be on the outside. Then bore two other holes one inch from the opposite end and put two more posts in. Connect the two posts on each side A to A and B to B as indicated.

Next obtain a piece of wood 2" x ⅜" x the width of the clothes-pin; attach two strips of copper ¾" x 1/16" x ⅜" to each side. Mount two binding posts on the opposite side as D and E, then solder wire (or connect in some way) the binding posts E to plate E' and D to D'. Connect D and E with the instruments and A and B with the 'phones, and pressing X and Y together, place on stationary contact blocks so as to make connection in the manner apparent.

Contributed by JOHN W. HOPKINS.

A TIE-CLASP TELEGRAPH KEY.

The telegraph key here shown costs one-tenth as much as one purchased in any store, and is smaller, neater, and just as efficient. It consists of a tie-clasp having a strip of brass, with a hard rubber knob soldered or riveted to it. The whole is then mounted on a base 3½ x 2 inches, with binding posts taken from old batteries. The illustration herewith explains fully.

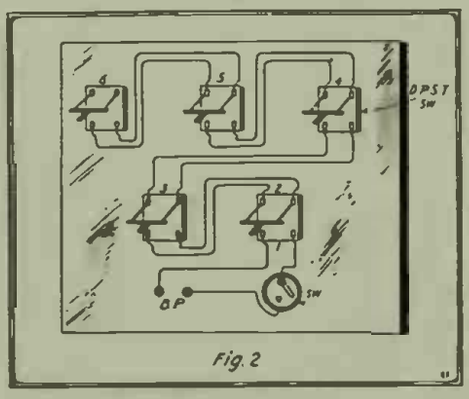
Connecting Up Dry Cells

By Frederick Von Lichtenow

NEARLY every experimenter who employs Dry Cells or other batteries as the main source of his current supply, keeps these cells, generally speaking, all neatly connected up—often in a dustproof container

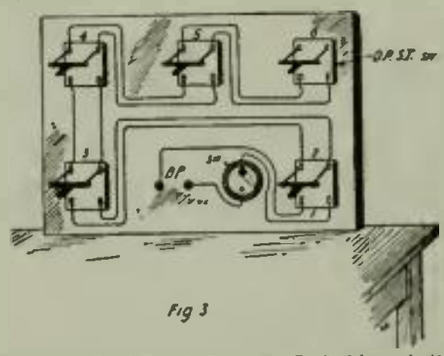
A Neat and Effective Battery-Control Switch-Board for Connecting into Circuit Any Number of Cells, from One to Six, on Parallel.

at that—always ready for the biggest job in his laboratory, for instance his "Spark-Coil" or "Tesla Set."



Whenever lesser pieces of apparata, such as a small motor, an electro-magnet, a buzzer, etc., etc., are to be worked, requiring only one or two dry cells, as the case may be, then these cells have to be separated from the rest of the "family", only to be put back and connected up again when the experiment is finished.

This constant disconnecting and connecting is nothing less than a genuine nuisance and does not tend to improve the condition of the connecting links, whatever they are.



There appear now and then in the technical periodicals schemes, embodying some form of a rotary multi-point switch which are intended to remedy this trouble. To a large extent they are successful in this, but everyone of those, which have come under my observation, was suffering from two other faults, which are nearly as bad as the one above cited: First, the cells were connected up in such a manner that, with only one cell switched-in, this cell was already using energy from the next following one; and this in repetition thru the whole row. Second, as a consequence of the first fault it is impossible to properly test each cell individually without going thru the disconnecting stunt again.

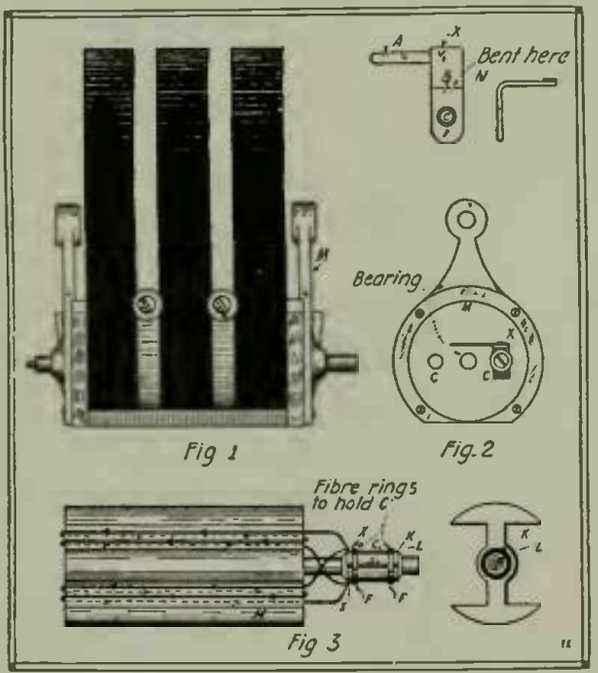
The scheme treated in this article has none of these drawbacks and is the cheapest and simplest one could think of; nothing, so to speak, has to be constructed and the few necessary finished parts are obtainable anywhere at a very slight expense.

As will be seen from the illustrations, this idea of connecting cells lends itself very well to both battery-box and switch-board, whichever one prefers. The cells are arranged as if intended to be connected up in "parallel", which is clearly shown in Fig. 1. Six cells require five (small sizes) D.P.S.T.-Switches, (of which switch No. 1 serves two dry cells) with an additional circuit switch on the one side of the container. There are two binding posts brought out on the same side—one directly connected, the other to the circuit switch, as is self-evident—for the connection of apparatus.

Another Style of Battery Switchboard for Connecting up Any Desired Number of Cells on Parallel.

In this Design of Battery Switchboard the Leads from the Cells Are Brought into the Switches from the back of the Panel.

The diagrams in Figs. 2 and 3 suggest two different ways of connecting the switches, etc., upon boards, with the battery wires running in from the back (not shown in sketches) and connected to their proper places, which are marked by figures, each representing one cell.



No doubt, there are several ways of eliminating those many switches without disturbing the above arrangement in the least, such as by using taps, switch-points, contact bushings in conjunction with sliding blades or rods, respectively, and other necessary parts, but these have in most cases, to be ordered, if obtainable at all, or made to order in some shop, which involves loss of time and often a respectable amount of money.

The scheme, as it is illustrated and described here, will, after all, be found to be the quickest, simplest and least expensive way of "getting there."

D. C. Dynamo from Magneto

Here is a dynamo-motor that any experimenter can make at practically no cost except a little patience and work. All the material can be purchased for a small sum. The material required are a telephone magneto and two telephone transformer coils, or about ¼ lb. No. 22 magnet wire. Also some pieces of brass, a brass tube, and some fiber and mica. Now, with all the material at hand, remove the two gear wheels on the magneto and take off the contact parts on the other end. The magneto now appears as in Fig. 1. Then take one end plate M off and drill a ¼-inch hole each side of the bearing at cc, midway between the bearing and edge of plate. Next cut two pieces of brass or copper of shape shown at X, Fig. 2. They measure about 1¼ inch. Drill a ¼-inch hole at c in each and solder a piece of spring brass A to the other end at X. Then bend into a right angle at B. These are the brushes, and they fasten to M thru cc with two battery binding posts, which are carefully insulated from the plate M.

Remove the armature of the magneto and cut away the fine wire wound thereon. Next take off about ten of the segments or laminations H, to make room for the commutator. The commutator C is made from a piece of brass tubing ½ inch long, which is slightly larger than the shaft. Now cut the tube in two halves lengthwise, being careful not to bend it. Take a piece of mica and wrap it around the shaft at L until it just fits the brass segments K.

Every Telephone Magneto Can Be Made Over, with Slight Changes, into a First-Rate "Direct-Current" Dynamo. Fine for Auto or Boat Lighting and Experimental Work.

Shellac the mica to the shaft, and then shellac the segments over the mica, taking care to leave a slot S between the segments on both sides. Two short pieces of fiber tubing (rings) F, F, are then slipped tightly over C. A tight fit is necessary. These rings hold the brass pieces C securely. A word of caution here: *Place the slot S just past center as shown.* Then tie securely and put away to dry. When dry wind the armature as tightly as possible with the magnet wire in the manner indicated by arrows. Wind an equal number of turns on each side of the shaft and solder the ends to the segments of the commutator at xx. The diagram shows plainly these operations. When completed, give the windings two coats of shellac and let dry. After it is thoroly dry, place a fiber washer on each end of the shaft and assemble as originally found. Place a small pulley on the end of the shaft that protrudes and all is complete. If directions have been closely followed a nice little machine will result. *It will run either as a dynamo or motor.* As a dynamo I was able to light 4 to 5 small tungsten lamps. On 4 to 6 volts it develops remarkable power. When running as a motor it works better with one of the magnets removed, as this lessens the strength of field so that the armature revolves more freely.

USEFUL LABORATORY INFORMATION.

Rain water may be used as distilled water, provided it is clean.

Baking soda is sodium bicarbonate.

Vinegar contains dilute acetic acid.

Common table salt is sodium chlorid.

Rust from a nail or other iron is ferric oxid.

Tea contains tannic acid.

Blackboard chalk is calcium carbonat.

Epsom salts is magnesium sulfate.

Sugar of lead is lead acetat.

Aqua fortis is nitric acid.

Aqua-regia is a mixture of nitric and hydrochloric acids.

Sal ammoniac is ammonium chlorid.

Sal soda is sodium carbonat.

"Hypo" is sodium thiosulfate.

Denatured alcohol is principally a mixture of wood and grain alcohol.

A porcelain mortar or pestal makes an excellent whet-stone.

Aqua ammonia is ammonium hydroxid.

"Lye" or caustic soda is sodium hydroxid.

Quicklime is calcium oxid; slacked lime is calcium hydroxid.

German silver contains no silver.

Freshly prepared ferric hydroxid is an antidote for arsenic poisoning.

The glue on postage stamps is dextrin.

Quartz is silicon dioxid.

The ruby, saffire and others gems are composed mainly of aluminum oxid.

Borax is sodium borat.

Salt-petre is potassium nitrat.

Copperas is ferrous (iron) sulfate.

Blue-stone is copper sulfate.

Hydrochloric acid and ammonium hydroxid are solutions of a gas in water.

Oxygen is made by heating potassium chlorat with manganese dioxid.

Carbon dioxid is prepared by treating marble chips with strong acid.

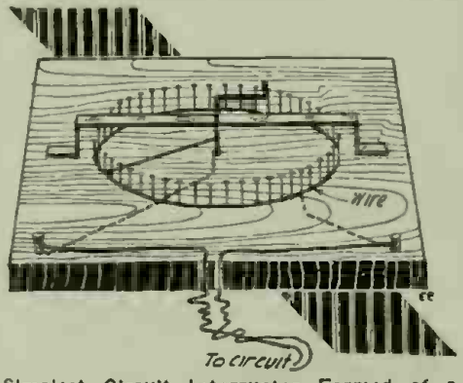
Hydrogen is prepared by treating zinc with strong acid.

Chlorin is easily prepared by heating a mixture of hydrochloric acid and manganese dioxid.

Sulfur dioxid is made by burning sulfur in air.

Nitrogen may be prepared by heating ammonium nitrit.

Pure silver may be prepared by treating silver nitrat with copper.



The silver is deposited as a gray powder, and may be collected by fusing into a solid.

N. KENNETH MEHAFFIE.

SILVER PLATING WITHOUT A BATTERY.

Dissolve about an ounce of silver in two ounces of nitric acid. After the silver is all dissolved throw into it a pint of water and four ounces of common salt. The salt will precipitate a powder which is pure silver. Filter off the water, or if there is no filter paper handy, pour off the water and repeat until all the effects of the salt have disappeared. To this white powder add two ounces of cyanide of potassium* and three ounces of hyposulphate of soda. Now add to all this two quarts of pure rain water and the silver mixture is complete.

The plating is done in the following manner. Hang the article to be plated in the solution at the end of a strip of lead or if more convenient, immerse the article in the solution and boil it for ten or twenty minutes, according to the thickness of the silvering desired. To obtain best results the articles to be plated must be free from grease and oil or dirt.

* This chemical is a deadly poison and must be handled with the most care.

Contributed by DAVID GOODMAN.

IMITATION GOLD.

Take 16 parts of platina, 7 parts copper, 1 part zinc, put in covered crucible, with powdered charcoal and melt together till the whole forms one mass and all are thoroly incorporated. Or take 4 oz. platina, 3 oz. silver and 1 oz. copper.

The RADIO LEAGUE of AMERICA

HONORARY MEMBERS
CAPT. W.H.G. BULLARD, U.S.N. NIKOLA TESLA.
PROF. REGINALD FESSENDEN. DR. LEE DE FOREST.

Manager, H Gernsback

Amateur Radio Restored

By H. GERNSBACK

WINNING one war seems like a great accomplishment, but winning two wars, one after the other, is a historic occurrence for which we have few counterparts.

When on Nov. 11 the glad news came that the great war had been won, the world once more breathed freely, and so did the American Radio Amateur, who had done his "bit" in bringing the war to a successful termination. But hardly was the armistice signed than the spectre of a new war—to the amateur—crept up over the horizon threatening to take away from him the freedom for which we had fought.

A nation may be opprest by a relentless foe if conquered, or it may be opprest in a similar manner by unjust laws which curtail the freedom of its people. Indeed, when it was proposed last winter to take away from the American Radio Amateur the freedom of the ether, which would have deprived the liberties of over 300,000 young men in this country, war was declared once more. This war was to the knife; it was as short as it was decisive. But Right as usual won over Might, and the American Radio Amateur won *his* war, as the Allies won theirs.

And, as the Allies will win the fruits of their victory in the months to come, so will the amateurs reap the fruit of their victory. Indeed, the reaping has already begun. On April 15th the ban on Radio, at least for *receiving*, was officially taken off, and a mighty shout went up when Radio Amateurs were again permitted to use the ether to their hearts' content. Altho the ban for *sending* has not been removed at this time of writing, the chances are that before the next issue is in your hands the freedom of the ether will be once more restored completely.

As soon as the newspapers published the welcome tidings on April 15th that the ban on receiving was off, hundreds of thousands of amateurs began dusting off their sets and aërials blossomed forth over night by the thousands to resume their former activities once more.

And wonders upon wonders! When we put our sets away two years ago we were accustomed to hear nothing but the crisp dots and dashes in flute-like, staccato sounds coming from the high power stations which we all had learned to love. But the war has changed everything—even radio, for now the *radio telephone* has come into its own.

Where formerly there was nothing but the *tah-de-dah* in our phones, the ether is now filled with the human voice flung far and broad over the land—nay, over the oceans—and as the months roll by the dots and dashes will grow less and less, and the human voice will come in over our aërials more and more, which is as it should be.

The writer has always contended that wireless telephony was the logical outcome of radio, and in years to come only the commercial high power stations will operate their dots and dashes with their high speed machines where the voice would not be as reliable. But the future of Radio Amateurism in this country is centered upon the radio telephone. While no doubt many of us will still cling to the dots and dashes, the radio telephone will probably soon be used in overwhelming numbers.

What a wonderful world it will be in one or two years hence! You will step out into the star-lit night and myriads of voices—noiselessly and invisibly—will fill the air all over the continent, flung thru the ether. You will hear nothing and you will see nothing. When you sit on the seashore gazing fascinated at the beauty of the tides, as they follow the moon, all the while the invisible and soundless voices will be all around you—nay, even pass thru your very body. But when you step in the humble little amateur radio station and clasp a pair of receivers onto your ears, the ether will be unlocked and all of these myriads of voices will be made audible to your ears. A perfect Babel of voices will greet you, but by means of your tuning devices you will be able to pick out the very voice you wish to listen to, tuning out all the others.

It is a glorious thought that we are fortunate enough to live in an age where such things are possible, and we must prove worthy of our new-gained liberty, now certain.

And the writer regrets to say that before the war we did not realize how fortunate we were, and we did not show by our actions that we appreciated the freedom of the ether.

There was constant bickering and quarreling on the side of the amateur, among themselves as well as with commercial and government stations. Profane talk took place not infrequently thru the ether, and many of us annoyed the commercial as well as the government operators by "hogging" the ether. Hence, it was not surprising that the government tried to pass laws to curb the amateurs and curtail their liberties.

If Radio Amateurism is to prevail in the new era, the amateurs must stop their former nonsense and must settle down strictly to business. They can and should receive all they want to their hearts' content. They can and will listen very shortly to President Wilson's voice when he speaks to us from the "George Washington," where everybody is free to listen in. Amateurs can listen in to their hearts' delight, whether it be to wireless-telephone or wireless telegraph. But when it comes to sending, we must mend our ways. If we do not, laws will be past sooner or later to curtail our entire liberties, and here the writer desires to make an important suggestion.

There are now a good many Radio Clubs and Associations all over the country. We cannot have too many. The suggestion is that every club and every association should appoint one or a number of expert amateurs to listen in nightly to messages that are violating the common rules, either by profane language, by "hogging" the ether, by Q. R. M. or by wilful interference. The offender should be sought out and promptly warned, and should he repeat his offense a second time, he should be promptly reported to the Radio Inspector of the district, and the various publications catering to the amateurs should be notified. A sworn statement relating the offense should be submitted to the publications, who will pledge themselves to publish the name of the offender.

The ELECTRICAL EXPERIMENTER, for one, will be glad to publish such names regularly, and it is believed that such measures will do more than anything else to increase the prestige of radio amateurism in the United States, and take it out of the school-boy class. There is little doubt that if we follow such procedures Radio Amateurism in the United States will become one of the great institutions of this country. We must show the world that we amateurs are serious-minded and do not use one of the greatest inventions for a

(*Continued on page* 174)

NAVY DEPARTMENT
Naval Communication Service
Office of the Director.
Washington, April 14, 1919.

Editor Electrical Experimenter
Sir:

The Acting Secretary of the Navy authorizes the announcement that effective April 15, 1919, all restrictions are removed on the use of radio receiving stations other than those used for the reception of commercial radio traffic. This applies to amateur stations, technical and experimental stations at schools and colleges, receiving stations maintained by jewelers or others desirous of receiving time signals, receiving stations maintained by manufacturers of radio apparatus, etc.

The restrictions on transmitting stations of all types are still in effect, as are the restrictions on stations operated regularly for the reception of commercial radio traffic. Both of the above classes of stations will be permitted to resume operation as soon as the President proclaims that a state of peace exists.

Attention is invited to the fact that all licenses for transmitting stations have expired, and that it will be necessary, when peace is declared, for the owners of these stations to apply to the Department of Commerce for new licenses.

Very respectfully,

(Signed) E. B. Woodworth,
Commander, U. S. Navy, Assistant Director Naval Communications.

The Above Is the Text of the Official Notification Restoring the Freedom of the Ether Once More. The Ban on Sending Is as Yet not Lifted. When Peace Is Declared, While Technically the Ban for Sending Will be Off, It Should be Remembered That All Sending Licenses Have Been Cancelled During the War and New Licenses Must Be Secured from the Department of Commerce. Address the Office of the Radio Inspector at the Custom House of Your District for Further Particulars.

The Moon's Rotation

By NIKOLA TESLA

In this article Dr. Tesla proves conclusively by theory and experiment that all the kinetic energy of a rotating mass is purely translational and that the moon contains absolutely no rotational energy, in other words, does not rotate on its axis.—EDITOR.

IN revising my article on "The Moon's Rotation", which appeared in the April issue of the ELECTRICAL EXPERIMENTER, I appended a few remarks to the original text in further support and eluci-

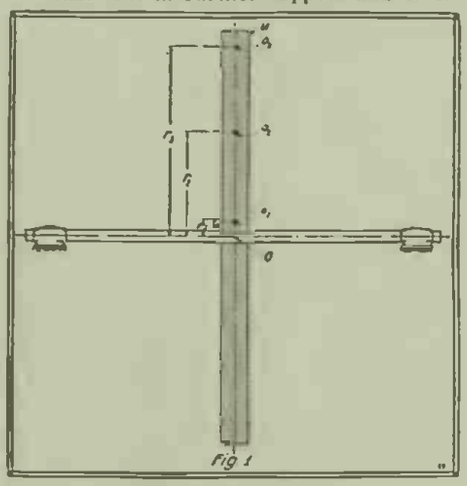

Fig. 1. In Determining the Kinetic Energy of a Rotating Mass, This Figure Shows the Selection of a Number of Points Taken Within the Straight Rod or Mass M, at Successive Distances from the Axis of Rotation O. Knowing These Values and the Speed of Rotation the Kinetic Energy of the Mass Is Readily Computed.

dation of the theory advanced. Due to the printer's error these were lost and, in consequence, I found it necessary to forward another communication which, unfortunately, was received too late for embodiment in the May number. Meanwhile many letters have reached me in which certain phenomena presented by rotating bodies, as the moon's librations of longitude, are cited as evidences of energy due to spinning motion, i. e., proofs of axial rotation of the satellite in the true physical sense. I trust that the following amplified statement will meet all of the objections raised and convert to my views those who are still unconvinced.

The kinetic energy of a rotating mass can be determined in four ways which are illustrated in diagrams, Figs. 1, 2, 3 and 4 and may be found more or less suitable.

Referring to Fig. 1, the method consists in selecting judiciously a number of points as o_1, o_2, o_3, etc., within the straight rod or mass M, respectively at distances r_1, r_2, r_3, etc., from the axis of rotation 0 and calculating the square root of the mean square of these distances. Its value being R_r, denoted radius of gyration, the *effective* velocity of the mass at n revolutions per second will be $V_e = 2\pi R_r n$ and its kinetic energy $E = \frac{1}{2} M V_e^2 = \frac{1}{2} M (2\pi R_r n)^2$.

In Fig. 2 the mass M, rotating n times per second about an axis 0 at right angles to the plane of the paper, is divided into numerous elements or small parts, most conveniently very thin concentric laminae, as l_1, l_2, l_3, etc., at distances r_1, r_2, r_3, etc., from 0. Since the kinetic energy of each part is equal to half the product of its mass and the square of the velocity, the sum of all these elemental energies $E = \frac{1}{2} \Sigma m V^2 = \frac{1}{2} m_1 V_1^2 + \frac{1}{2} m_2 V_2^2 + \frac{1}{2} m_3 V_3^2 + \ldots\ldots = \frac{1}{2} m_1 (2\pi r_1 n)^2 + \frac{1}{2} m_2 (2\pi r_2 n)^2 + \frac{1}{2} m_3 (2\pi r_3 n)^2 + \ldots\ldots$

A different form of expression for the energy of a rotating body may be obtained by determining its moment of inertia. For this purpose the mass M (in Fig. 3), rotating n times per second about an axis 0, is separated into minute parts, as m_1, m_2, m_3, etc., respectively at distances r_1, r_2, r_3, etc., from the same. The sum of the products of all these small masses and the squares of their distances is the moment of inertia I, and then $E = \frac{1}{2} I \omega^2$, $\omega = 2\pi n$ being the angular velocity.

It is obvious that in all these instances many points or elements will be required for great accuracy but, as a rule, very few are sufficient in practice.

Still another way to compute the kinetic energy is illustrated in Fig. 4, in which case the quantity I is given in terms of the moment of inertia I_c about another axis parallel to 0 and passing thru the center of gravity C of mass M. In conformity with this the energy of motion $E = \frac{1}{2} M V^2 + \frac{1}{2} I_c \omega^2$ in which equation V is the velocity of the center of gravity.

The preceding is deemed indispensable as I note that the correspondents, even those who seem thoroly familiar with mechanical principles, fail to make a distinction between theoretical and physical truths which is essential to my argument.

In estimating the kinetic energy of a rotating mass in any of the ways indicated we arrive, thru suitable conceptions and methods of approximation, at expressions which may be made quantitatively precise to any desired degree, but do not truly de-

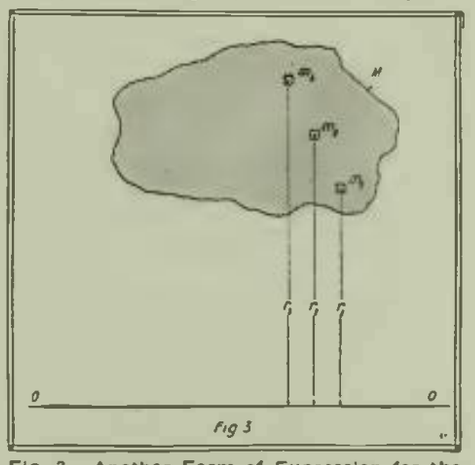

Fig. 3. Another Form of Expression for the Energy of a Rotating Body May Be Obtained by Determining Its Moment of Inertia. Here the Mass M Is Subdivided Into Minute Parts m_1, m_2, m_3, ... etc. The Sum of the Products of These Masses and the Squares of Their Distances Is the Moment of Inertia, Which with the Angular Speed, Gives the Kinetic Energy E.

fine the actual condition of the body. To illustrate, when proceeding according to the plan of Fig. 1, we find a certain hypothetical velocity with which the entire mass should

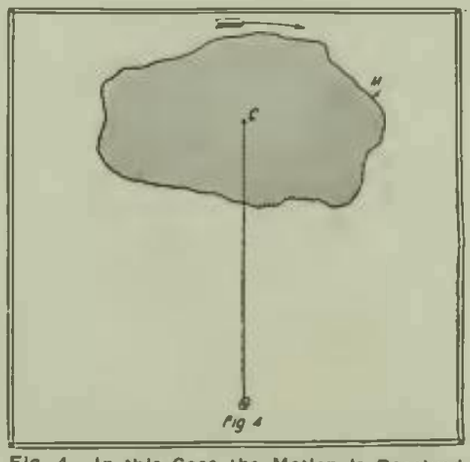

Fig. 4. In this Case the Motion Is Resolved Into Two Separate Components—One Translational About O and the Other Rotational About C. The Total Kinetic Energy of the Mass Equals the Sum of These Two Energies.

move in order to contain the same energy, a state wholly imaginary and irreconcilable with the actual. Only, when *all* particles of the body have the same velocity, does the

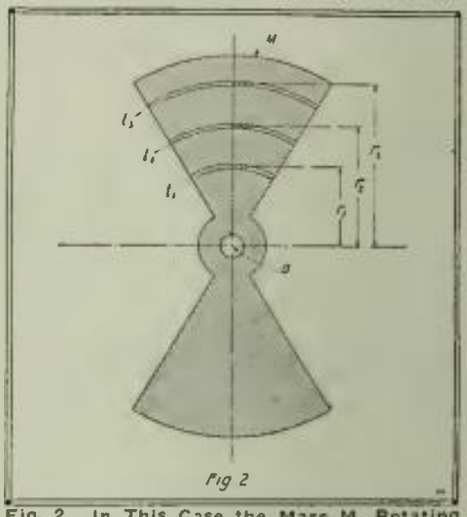

Fig. 2. In This Case the Mass M, Rotating n Times Per Second, About An Axis O, Is Divided Into Numerous Elements or Small Parts at Various Radii from O. Knowing the Kinetic Energy of Each Part, the Whole Kinetic Energy of the Mass Is Easily Determined by Taking a Summation of the Individual Quantities.

product $\frac{1}{2} M V^2$ specify a physical fact and is numerically and descriptively accurate. Still more remote from palpable truth is the equation of motion obtained in the manner indicated in Fig. 4, in which the first term represents the kinetic energy of translation of the body as a whole and the second that of its axial rotation. The former would demand a movement of the mass in a definite path and direction, all particles having the same velocity, the latter its simultaneous motion in another path and direction, the particles having different velocities. This abstract idea of angular motion is chiefly responsible for the illusion of the moon's axial rotation, which I shall endeavor to dispel by additional evidences.

With this object attention is called to Fig. 5 showing a system composed of eight balls M, which are carried on spokes S, radiating from a hub H, rotatable around a central axis 0 in bearings supposed to be frictionless. It is an arrangement similar to that before illustrated with the exception that the balls, instead of forming parts of the spokes, are supported in screw pivots *s*, which are normally loose but can be tightened so as to permit both free turning and rigid fixing as may be desired. To facilitate observation the spokes are provided with radial marks and the lower sides of the balls are shaded. Assume, first, that the drawing depicts the state of rest, the balls being rotatable without friction, and let an angular velocity $\omega = 2\pi n$ be imparted to the system in the clockwise direction as indicated by the long solid arrow. Viewing a ball as M, its successive positions 1, 2, 3—8 in space, and also relatively to the spoke, will be just as drawn, and it is evident from an inspection of the diagram that while moving with the angular velocity ω about 0, in the clockwise direction, the ball turns, with respect to its axis, at the same angular velocity but in the opposition direction, that of the dotted arrow. The combined result of these two motions is a translatory movement of the ball such that all particles are animated with the same velocity V, which is that of its center of gravity. In this case, granted that there is absolutely no friction the

www.americanradiohistory.com

kinetic energy of each ball will be given by the product of ½ M V² not approximately, but with mathematical rigor. If now the pivots are screwed tight and the balls fixt rigidly to the spokes, this angular motion relatively to their axes becomes physically impossible and then it is found that the kinetic energy of each ball is increased, the increment being exactly the energy of rotation of the ball on its axis. This fact, which is borne out both by theory and experiment, is the foundation of the general notion that a gyrating body—in this instance ball M—presenting always the same face towards the center of motion, *actually* rotates upon its axis in the same sense, as indicated by the short full arrow. *But it does not tho to the eye it seems so.* The fallacy will become manifest on further inquiry.

To begin with, observe that when a mass, say the armature of an electric motor, rotating with the angular velocity ω, is reversed, its speed is $-\omega$ and the difference $\omega - (-\omega) = 2\omega$. Now, in fixing the ball to the spoke, the change of angular velocity is only ω; therefore, an additional velocity ω would have to be imparted to it in order to cause a clockwise rotation of the ball on its axis in the true significance of the word. The kinetic energy would then be equal to the sum of the energies of the translatory and axial motions, not merely in the abstract mathematical meaning, but as a physical fact. I am well aware that, according to the prevailing opinion, when the ball is free on the pivots it does not turn on its axis at all and only rotates with the angular velocity of the frame when rigidly attached to the same, but the truth will appear upon a closer examination of this kind of movement.

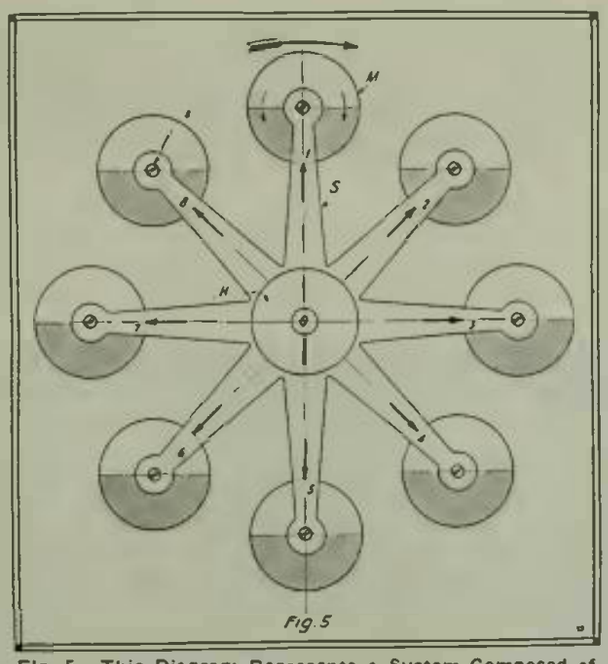

Fig. 5. This Diagram Represents a System Composed of 8 Balls M, Carried on Spokes S, and Rotating Around Center O. The Balls Are Freely Rotatable on Pivots Which Can Be Tightened. With This Model the Fallacy of the Moon's Rotation on Its Axis Is Demonstrable.

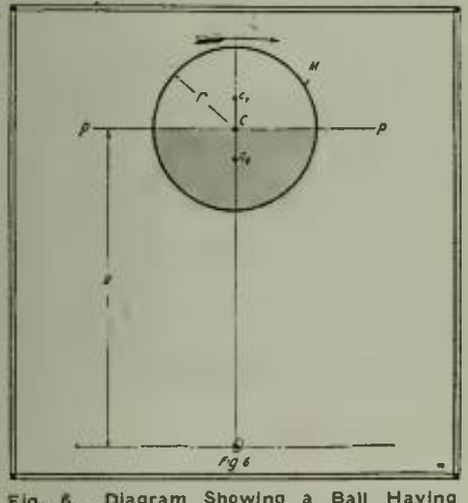

Fig. 6. Diagram Showing a Ball Having Mass M, of Radius r, Rotating About Center O, and Used in the Theoretical Analysis of the Moon's Motion.

Let the system be rotated as first assumed and illustrated, the balls being perfectly free on the pivots, and imagine the latter to be gradually tightened to cause friction slowly reducing and finally preventing the slip. At the outset all particles of each ball have been moving with the speed of its center of gravity, but as the bearing resistance asserts itself more and more the translatory velocity of the particles nearer to the axis 0 will be *diminishing*, while that of the diametrically opposite ones will be *increasing*, until the maxima of these changes are attained when the balls are firmly held. In this operation we have thus deprived those parts of the masses which are nearer to the center of motion, of some kinetic energy of *translation* while adding to the energy of those which are farther and, obviously, the gain was greater than the loss so that the *effective* velocity of each ball as a whole was increased. *Only so* have we augmented the kinetic energy of the system, not by causing *axial rotation* of the balls. The energy E of each of these is *solely* that of translatory movement with an effective velocity V_e as above defined such that $E = \frac{1}{2} M V_e^2$. The axial rotations of the ball in either direction are but apparent; *they have no reality whatever* and call for no mechanical effort. It is merely when an extraneous force acts independently to turn the whirling body on its axis that energy comes into play. Incidentally it should be pointed out that in true axial rotation of a rigid and homogenous mass all symmetrically situated particles contribute equally to the momentum which is not the case here. That there exists not even the slightest tendency to such motion can, however, be readily established.

For this purpose I would refer to Fig. 6 showing a ball M of radius *r*, the center C of which is at a distance R from axis 0 and which is bisected by a tangential plane *pp* as indicated, the lower half sphere being shaded for distinction. The kinetic energy of the ball when whirled *n* times per second about 0 is according to the first form of expression $E = \frac{1}{2} M V_e^2 = \frac{1}{2} M (2\pi R_g n)^2$, M being the mass and R_g the radius of gyration. But, as explained in connection with Fig. 4, we have also $E = \frac{1}{2} M V^2 + \frac{1}{2} I_c \omega^2, V = 2\pi R n$ being the velocity of the center of gravity C and I_c the moment of inertia of the ball, about the parallel axis passing thru C and equal to $\frac{2}{5} M i^2$ so that $E = \frac{1}{2} M (2\pi R n)^2 + \frac{1}{5} M r^2 (2\pi n)^2$. Neither of these two expressions for E describes the actual state of the body but the first is certainly preferable conveying, as it does, the idea of a single motion instead of two, one of which moreover is devoid of existence. I shall first undertake to demonstrate that there is no torque or rotary effort about center C and that the kinetic energy of the supposed axial rotation of the ball is mathematically equal to zero. This makes it necessary to consider the two halves separated by the tangential plane *pp* wholly independent from one another. Let c_1 and c_2 be their centers of gravity, then $Cc_1 = Cc_2 = \frac{3}{8} r$. In order to ascertain the kinetic energy of the hemispheres we have to find their radii of gyration which can be done by determining the moments of inertia Ic_1 and Ic_2 about parallel axes passing thru c_1 and c_2. Complex calculation will be avoided by remembering that the moment of inertia of either one of the half spheres about an axis thru C is $I_C = \frac{1}{2} \times \frac{2}{5} M r^2, = \frac{1}{5} M r^2$, and since $M = 2$ m, $I_C = \frac{2}{5}$ m r^2. This can be expres in terms of the moments Ic_1 and Ic_2; namely, $I_C = Ic_1 + m (\frac{3}{8} r)^2 = Ic_2 + m (\frac{3}{8} r)^2$. Hence $Ic_1 = Ic_2 = I_C - m (\frac{3}{8} r)^2 = \frac{2}{5}$ m $r^2 - 9/64$ m $r^2 = 83/320$ m r^2. Following the same rule the moments of inertia of the half spheres about the axis passing thru the center of motion 0 can be found. Designating the moments for the upper and lower halves of the ball, respectively, I_{O1} and I_{O2} we have $I_{O1} = m (R + \frac{3}{8} r)^2 + Ic_1 = m (R + \frac{3}{8} r)^2 + 83/320$ m r^2 and $I_{O2} = m (R - \frac{3}{8} r)^2 + Ic_2 = m (R - \frac{3}{8} r)^2 + 83/320$ m r^2. Thus for the upper half sphere the radius of gyration $R_{g1} =$

$$\sqrt{\frac{I_{O1}}{m}} = \sqrt{(R + \tfrac{3}{8} r)^2 + 83/320\ r^2}$$

and for the lower one $R_{g2} =$

$$\sqrt{\frac{I_{O2}}{m}} = \sqrt{(R - \tfrac{3}{8} r)^2 + 83/320\ r^2}$$

These are the distances from center 0, at which the masses of the half spheres may be concentrated and then the algebraic sum of their energies—which are wholly translatory those of axial rotation being nil—will be exactly equal to the total kinetic energy of the ball as a unit. The

RADIO DEPARTMENT

Tesla Bulbs

Early in Nikola Tesla's Researches—In Fact as Far Back as 1892—He Discovered a Most Peculiar and Wonderful Vacuum Bulb Phenomena. The Effect was That, Under Certain Critical Conditions, This Bulb Would Cause a Ray to Be Shot off in the Manner Shown, Which Ray Would Revolve or Oscillate Under the Influence of a High-Frequency Current and in Synchrony with It. By Utilizing This Principle, Dr. Tesla Believes It Is Possible to Produce a Radio Detector More Sensitive Than the Audion or Fleming Valve.

IN the May issue in his article, "True Wireless," Nikola Tesla mentions the forerunner of the Audion, a Vacuum Bulb, which he used in his earlier experiments.

We have been in receipt of numerous letters from many individuals interested in this bulb who desire further particulars as to its operation, etc.

Accordingly, we publish herewith some excerpts from a lecture by Dr. Tesla delivered before the Institution of Electrical Engineers and Royal Institution, London, February, 1892.

"I think it best at this juncture to bring before you a phenomenon, observed by me some time ago, which to the purely scientific investigator may perhaps appear more interesting than any of the results which I have the privilege to present to you this evening.

"It may be quite properly ranked among the brush phenomena—in fact, it is a brush, formed at, or near, a single terminal in high vacuum.

"In bulbs provided with a conducting terminal, tho it be of aluminum, the brush has but an ephemeral existence, and cannot, unfortunately, be indefinitely preserved in its most sensitive state, even in a bulb devoid of any conducting electrode. In studying the phenomenon, by all means a bulb having no leading-in wire should be used. I have found it best to use bulbs constructed as indicated in Figs. 1 and 2.

"In Fig. 1 the bulb comprises an incandescent lamp globe L, in the neck of which is sealed a barometer tube b, the end of which is blown out to form a small sphere *s*. This sphere should be sealed as closely as possible in the center of the large globe. Before sealing, a thin tube *t*, of aluminum sheet, may be slipt in the barometer tube, but it is not important to employ it.

"The small hollow sphere *s* is filled with some conducting powder, and a wire *w* is cemented in the neck for the purpose of connecting the conducting powder with the generator.

"The construction shown in Fig. 2 was chosen in order to remove from the brush any conducting body which might possibly affect it. The bulb consists in this case of a lamp globe L, which has a neck *n*, provided with a tube *b* and small sphere *s*, sealed to it, so that two entirely independent compartments are formed, as indicated in the drawing. When the bulb is in use the neck *n* is provided with a tinfoil coating, which is connected to the generator and acts inductively upon the moderately rarefied and highly conducting gas inclosed in the neck. From there the current passes thru the tube *b* into the small sphere *s*, to act by induction upon the gas contained in the globe L.

"It is of advantage to make the tube *t* very thick, the hole thru it very small, and to blow the sphere *s* very thin. It is of the greatest importance that the sphere *s* be placed in the center of the globe L.

"Figs. 3, 4, 5, indicate different forms, or stages, of the brush. Fig. 1 shows the brush as it first appears in a bulb provided with a conducting terminal; but, as in such a bulb it very soon disappears—often after a few minutes—I will confine myself to the de-

Alexanderson's "Barrage" Receiver

The Highly Perfected Tuning Device That Riddled the German "Radio Barrage"

E F. W. ALEXANDERSON, consulting engineer and radio expert, related before a large gathering of leading American radio experts, at the April meeting of the Institute of Radio Engineers held in New York City, how Yankee ingenuity overcame German efficiency in the battle to control the air by wireless during the war. As in the fighting on land and sea, the Americans won!

The Germans installed powerful wireless apparatus at strategic points, and blocked communication with a barrage of meaningless messages that interfered with the sending and receiving of important messages. Something had to be done, and when the American Navy unfurled its battle flag in foreign seas it overcame the German interference with the wireless, and so made a remarkable stride in the science of aërial communication.

Mr. Alexanderson was one of the engineers who perfected the barrage receiver, as the device is termed. This invention permits an operator to tune out the powerful messages sent from points near at hand, and pick out of the clashing of radio waves the message sent from greater distances. In a word, he can isolate all messages except the one he desires to hear.

The problem of combating the barrages of senseless messages became serious as the war wore along. It was rather disconcerting to an Allied operator receiving an important message to have something like this break in on him—"Don't eat apple pie on Thursday. Yours till the watch on the Rhine stops. Gott mit Uns," yet it was just such messages that literally flooded the air when the wireless of the Allies was working.

Mr. Alexanderson explained two new devices at this lecture—the first, the "bridge receiver," which permits the speaker in a radiotelephone communication to break in on the second party at any time, and the wonderfully clever radio "barrage receptor."

Alexanderson Radio Receiver—"Barrage" Section.

The first invention, the "bridge receptor," gives to wireless telephony the same efficiency as the ordinary telephone. It enables the user to interrupt the person he is talking with without manipulating any apparatus. It will make it possible in the early future for a subscriber to converse with another subscriber in Europe while using the ordinary telephone installed in his home. He also will be able to speak to friends on ships in midocean.

The object of this development was briefly to provide means for neutralizing the overwhelming intensity of the transmitted signal so as to make the receiving set sensitive to the faint impulses of the distant signal. Popularly speaking, the corresponding equivalent in sound waves would be to have an ear which could be so adjusted that a person could stand close to a steam whistle without hearing the whistle, but listen to a person speaking from a distance of a few hundred feet (about a hundred meters). A successful solution of this problem was found as described. This method of reception which is characterized by a static bridge neutralization may be properly classified as the "bridge receiver."

The Barrage Receiver.

During the war the same problem presented itself again in a form which called for a new solution. Distances are only relative, and a steam whistle located in Germany might make such a noise that it would completely drown out both in England and France the sound of the voice calling from America. To find a way to counteract such a continuance was seriously considered by the Inter-Allied conference in February, 1918; and appeals for a solution were conveyed to the author by the French representative in this country, Lieut. Paternot. The solution to this problem, which was adopted by the American as well as the French government after the first demonstration, has become known as the "barrage receiver." This name appears appropriate because the word "barrage" has not only the military mean-

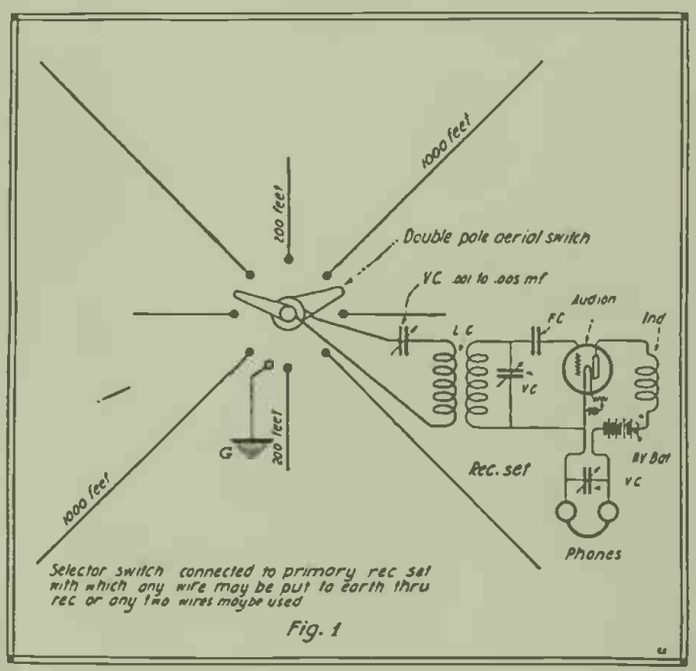
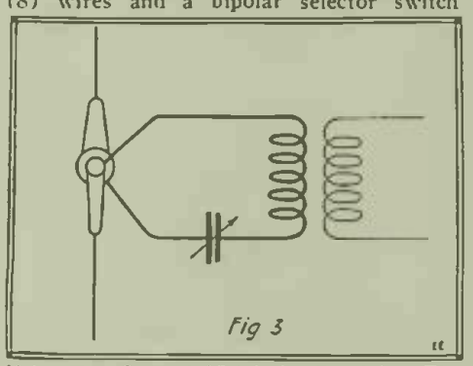
The Rogers Underground Aërial for Amateurs



Specially Prepared with the Collaboration of Mr. James Harris Rogers

SINCE the publication of the original article on the Rogers Underground Wireless System, published in the March, 1919, issue of the ELECTRICAL EXPERIMENTER, the Editors have been literally besieged by hundreds and thousands of letters from radio experimenters in all parts of the world, asking for data on the construction of *Rogers underground aërials* suited to the requirements of the Wireless Amateur. The original article contained a great deal of valuable data, which should be carefully read and digested by every radio man, whether he be a student or a professional. In the present article an effort has been made to answer some of the questions which have seemed to annoy the average radio "bug" considerably, — especially those residing in cities where it is difficult and frequently impossible to bury an aërial longer than a few feet. We may say right here, that for those experimenters so situated, there is a solution, or in fact, two solutions, namely—to use a *spiral antenna*, such as has been tried out successfully in U. S. Naval tests on the Rogers System, and which spirals may be buried in the ground a few feet, or placed in a well or other body of water; and secondly, for the experimenter who is not allowed to disfigure an apartment house or other pretentious dwelling with an ugly looking aërial, there is the newly developed *loop antenna*, which can be used right in the radio room. Indoor aërials have been greatly perfected during the war, and now by means of greatly improved and highly sensitive wireless receiving instruments and amplifiers available, particularly those using audions as detectors and amplifiers, they are excellent, and satisfactory results are obtainable by means of a concentrated loop or spiral antenna, small enough to be placed in the radio laboratory.

For the present, we will listen to the sound advice given by our mutual friend, Mr. James Harris Rogers, on some of the practical outstanding features of his underground system, used in conjunction with straight-away single wire underground aërials, as well as loop aërials. Among other things, Mr. Rogers has the following to say regarding the installation of simple underground aërials:



Mr. Rogers Talks to the Amateurs.

"The first installation of my underground antenna was made in the woods about a mile from my laboratory and consisted in burying wires in the earth; the wires radiated from the station as the spokes of a wheel,—*some wire bare* and *some insulated:* their lengths varied from 200 to 1,000 feet. (See Fig. 1).

Rogers Underground Aërial System for General Requirements, Showing Bipolar Selector Switch Connected to Primary Circuit of Receiving Set. Any Aërial Wire May Be Grounded Thru the "Set," or Any Two Wires May Be Used as Desired.

"It is obvious that a number of persons can receive at the same time, one operator to each wire. There is no interference, one with another. Figure 1 shows eight (8) wires and a bipolar selector switch connected to the primary receiving circuit. With this switch any individual wire may be *grounded*, or any *two wires* may be used. *Bare wires give the loudest signals but static is more pronounced.* The deeper the wires are buried, the better the signals, with a corresponding reduction of static. Short wires show a remarkable degree of directivity; long ones to a less degree and in proportion to their length. (See Figs. 2 and 3).

Using Two Ground Aërials for Receiving. The Aërials Should Lie in the Plane of the Station Being Received.

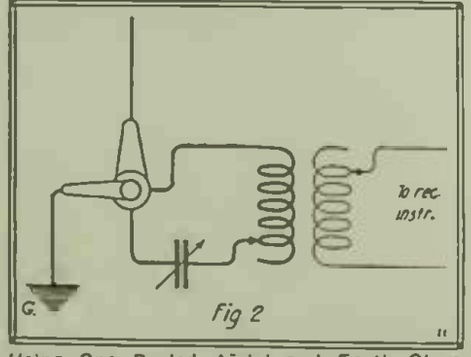
"When using two wires at right angles to each other, signals are heard from any direction. (Fig. 4).

"*The system works best in fresh water or very wet earth.* The primary circuit should have a variable condenser (.001 m.f. or higher capacity) in series. When insulated wires are covered with metal, lead, iron, etc., some remarkable results are obtained. These wires may be entirely enclosed in an iron gas pipe, for instance, (Fig. 5), or the joints may be connected by rubber hose. (Fig. 6).

"Here are some measurements taken with this last form of aërial:

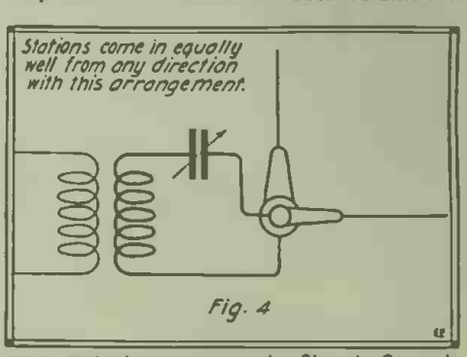
Audibilities with *one bulb* only, on "Nauen" station, Germany:

Length Antenna	*When signals are weak*	*When better*	*When best*
2,000 feet..	15	25	50
2,500 " ..	30	50	100
3,000 " ..	60	100	200
3,500 " ..	120	200	400
4,000 " ..	240	400	800



"Regarding the tests with loops I will state briefly that I have successfully tried different forms and sizes.

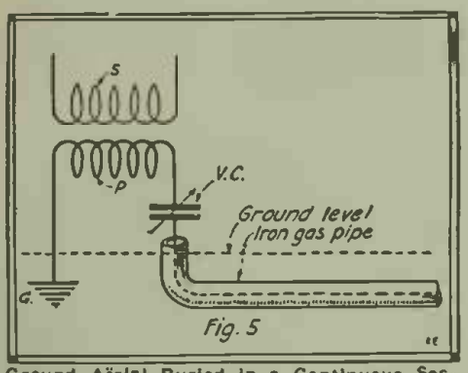
"I first had a well bailed out and lowered a loop antenna into it; the well was 50 feet deep. (See Fig. 7). The signals were as loud at the bottom as when above the earth. I next had the well filled with water and the results were the same, excepting that the note of the sending station became higher and higher as it was lowered. Upon revolving it I found the directional characteristics were the same in the water as when out. These tests were made about two years ago, and I at once realized that *loops* or *cages* could be used in the dugouts of France, or on submarines when submerged.



Regarding the dimensions of loop antennae used on submarines, these coils measure about 3 feet square in some instances. The wires are very heavily insulated and placed in a box filled with pitch, the connections are lead below and the coil can be revolved for directional observations."

Kind of Wire Used for Underground Aërials.

Most of the inquiries from Radio Experimenters and those intending to install experimental stations, and wishing to make use of the "static-proof" Rogers underground antenna, on which signals may be received *even thru a thunderstorm*, indicate that the greatest problem to solve seems to be the size and the kind of wire to be used, and how it shall be buried. Some very excellent results have been obtained in

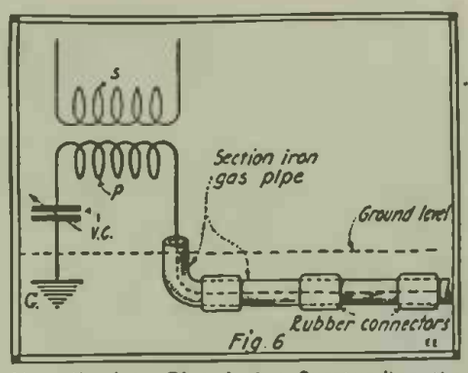


Using One Buried Aërial and Earth Gives Same "Directivity" as When Two Wires Are Used.

With This Arrangement the Signals Came In Equally Well from Any Direction. A Good "Stand-by" Hook-up.

www.americanradiohistory.com

Ground Aërial Buried in a Continuous Section of Iron Pipe. Excellent Results Have Been Obtained with This Scheme.



experimental work carried on at one of the leading American universities with aërial conductors laid on the ground, and where the experimenter has the time and space to try this out, he may gain some useful and valuable knowledge by experimenting in this direction. Ordinarily the wire, of whatever kind it may be, as used when installing the Rogers underground aërial, is buried about three feet deep in the earth. For most Amateur requirements, the wire only need be about 100 to 200 feet long, and so the digging of the ditch is not such a great problem; in fact, it can be plowed open, at least part of the depth, and where rivers, brooks or ponds are available the insulated wire can be placed in them directly and allowed to rest on the bed.

Regarding the choice of wire to be used, it becomes evident that even bare copper or other wire may be utilized when desired, as Mr. Rogers has pointed out in the above contribution. The size of this wire should be about No. 12 or 14 B. & S. gage, the heavier the better.

The official U. S. Navy reports of tests on the Rogers Underground System mention that no increased efficiency is obtained by using more than one wire, and that this may be a No. 12 or 14 B. & S. gage, weather-proof or rubber-covered copper conductor. In any case, the free end of the wire should be well taped, and preferably covered with some rubber cement, so as to keep it insulated. Experiments have been tried both by Mr. Rogers at his Hyattsville, Md., laboratory, and also by the Navy Department, with underground aërials placed in terra cotta pipes, but this construction is rather expensive, and the results obtained do not justify its use.

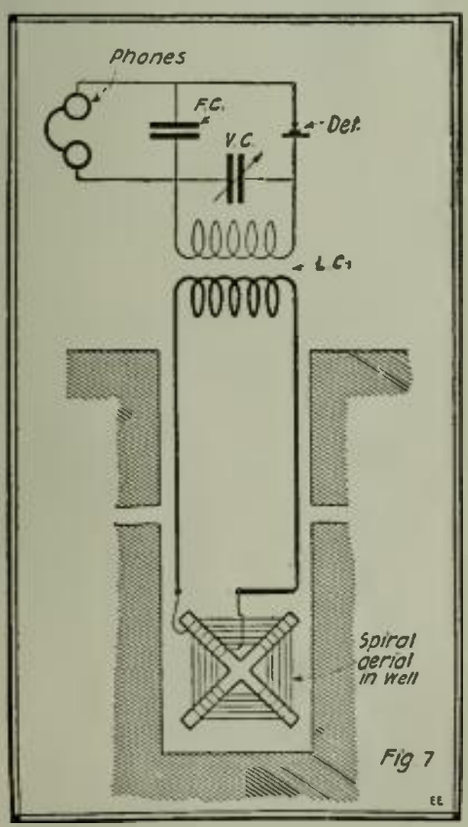
Other forms of wire used both by Mr. Rogers and the Navy Department experts include lead-covered telephone cable, which is, of course, thoroly damp-proof, while a conductor holding considerable favor with the inventor is the heavy rubber-covered, high-tension, auto ignition cable. This is highly efficient for aerial requirements, as it is stranded and therefore of low high frequency resistance.

In any case, a little common sense and logic will give the answer to many of the simple problems arising in connection with the installation of these aërials, such as, for instance, the length of aërial to be used for a certain range of wave lengths. It is manifest that the longer the antenna, the longer the wave length to which it will properly respond. Considering that an antenna is used having a length of, say, 150 to 200 feet, then practically all the shorter wave lengths up to 600 meters and more should be readily picked up on this antenna, especially with the variable condenser hooked up in series with the primary of the loose coupler, as shown in the accompanying diagrams. Naturally the wire buried in the ground has a higher electrostatic capacity than the old-style antenna wires, elevated 40 to 50 feet above the ground, and we can reduce this capacity as desired, so as to tune any certain wave lengths, by connecting another capacity in series with it; in exactly the same manner as short wave lengths are tuned in on the regular elevated aërials, by connecting a variable capacity in series with the antenna circuit, and the primary of the loose coupler. Long wave lengths are tunable by using large condensers and loose couplers preferably.

Here the Iron Pipe Jacket Surrounding the Buried Aërial is Divided up into 20-Foot Sections by Means of Rubber-Hose Connectors; a Later Development.

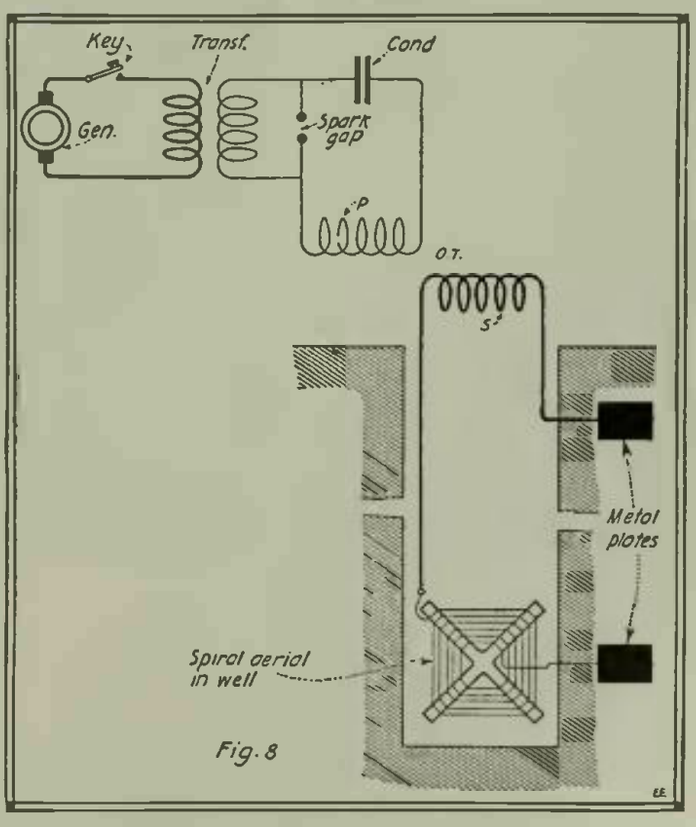
AUDIONS ON ALTERNATING CURRENT

Well, "Radio-Bugs," the very latest thing in Audion circuits is to cut out the expensive high voltage batteries, which are forever deteriorating and necessitating the purchase of new ones, or else the use of messy miniature storage batteries, and to operate your Audions, both filament and plate circuits, with ALTERNATING CURRENT. Sounds impossible, doesn't it? But it is a fact, nevertheless. Don't miss this important article, which will be worth many dollars to you, to appear in the next issue of the ELECTRICAL EXPERIMENTER. Read this special article entitled "Operate Your Audion Receiving Set on A.C." by Elliott A. White, formerly instructor in Radio at the Carnegie Institute of Technology, with diagrams and complete data on the building of the transformer, and other details. This is but one of the big feature Experimental Radio Engineering articles we have in preparation for the July number. It is the greatest revelation you ever read in Radio literature. Don't miss it, "Radio-Bugs"!



Spiral or Loop Aerials.

As shown in the diagram, Fig. 7, interesting results were obtained with a spiral antenna, composed of a dozen or so turns of insulated wire, such as high tension cable or No. 14 R. C. solid conductor lowered into a well, both with and without water in it.



As pointed out in the original article on the Rogers underground system in the March issue, very promising results have been obtained in transmitting with the underground antenna, and Fig. 8 shows how a small transmitting set was operated with such an aërial, coupling the exciting or spark gap circuit with the antenna oscillatory circuit by means of a two-coil oscillation transformer, L, C. In this case two metal plates, about one yard square, are placed in the earth adjacent to the well, one of which connects with the secondary, S, of the oscillation transformer, while the other plate connects with the free end of the spiral antenna.

If the spiral antenna is used, it should be mounted so as to be revolvable on its vertical axis, and it should be placed in the vertical plane as shown in Figs. 7 and 8. Excellent results have been and should be obtained in transmitting with the underground antenna, with the usual insulation incident to the form of conductor above

(*Continued on page* 187)

Some Very Surprising Results Were Obtained in Receiving with a Spiral Antenna Lowered into a Dry Well. Slightly Different Results Were Noticed with Water in the Well.

Distances up to Fifty Miles Have Been Covered Very Successfully in Transmitting with the Rogers Underground Aërial. In This "Transmitter," the Spiral Antenna Is Placed Down in a Well, Metal Ground Plates Being Connected as Shown.

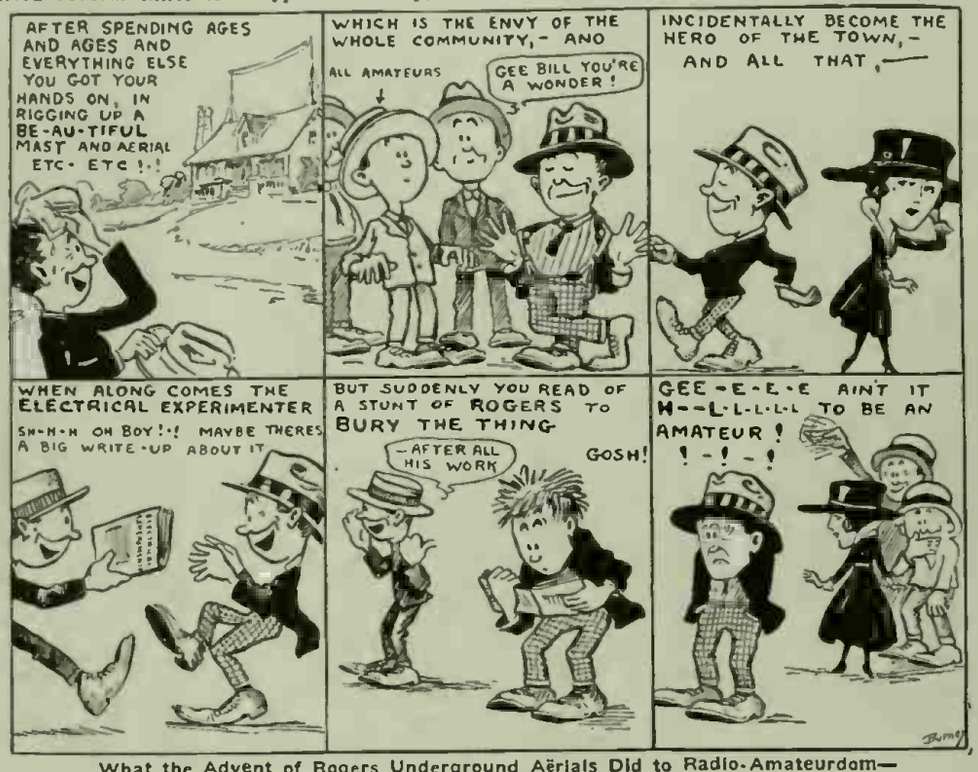
Learning the Code

By HOWARD D. WILDMAN

IN the June, 1918, "E. E.," page 101, there was an article by Mr. Rockwood, relating to Thomas Reed's idea in the January issue, about a new scheme for learning the Continental code. Mr. Rockwood says he tried the scheme himself, but found he often accented in the wrong place and so got the wrong letter. I foresaw this possibility before I tried out the idea and hunted up one substitute word—L—"lo-*cal*-ity." The others I found O. K. Mr. Rockwood says the catchword for "J" is "Jerusalem." It isn't. It is "Ja-*pan-nese-ness*," and I have found that you can't get it wrong.

Now as to my experience—before I read Mr. Reed's article I knew only two or three letters—e, i, t. I read the article and memorized the catchwords.

Before this I had tried several times to learn the code, but I was apt to get .—.. for .—. or ..—. for ——.— After memorizing the catchwords, in an hour or so, I could write a sentence and then rewrite it correctly in dots and dashes. At that time I had no key, receiver or anything but an A. C. toy transformer, a rheostat and a few other instruments. I made a key and receiver and practised sending to myself. A friend of mine learned the code meanwhile by memorizing the dots and dashes—a long process, during which time I learned to recognize the sound in the receivers. To this day he occasionally, when sending, shouts to me, "Hey, what's 'P'", or something similar, and I can always tell him.



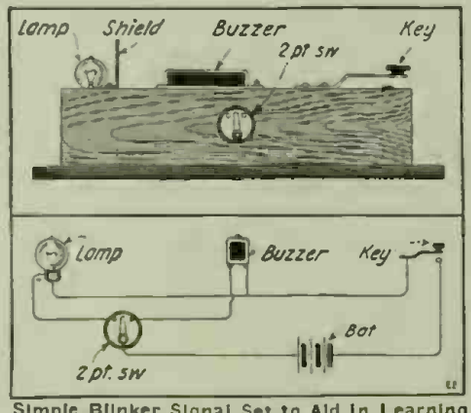
Mr. Rockwood says one must by this method learn the system and then *unlearn* it. This is not quite true. One *gradually* gets to send without using the catchword. Finally one gets to the point where one sends or receives as Mr. Rockwood says it should be done. This comes of itself without effort, after a little familiarity. My friend will sometimes take .—— to be "U," etc. My experience proves that if he had learned by catchwords, this would not happen. I don't confuse ..—. with .—.. or .— with —. The catchword positively prevents mistakes in sending, as you wouldn't send —. for "away," nor ..—. for "lo-*cal*-it-y."

For receiving, the catchword is useless. This can be readily seen as .—. would not readily call to mind "fi-li-*pi*-no.". But by using the catchword to send to one's self you learn to recognize ..—. as "F." After some practise, when you want to send "F," you do not think "fi-li-*pi*-no," or ..—. but send it without thinking.

You say—"Of what use then, is the catchword? It is learned only to be discarded again." The catchword serves to teach the code, so that the student can send to himself and teach himself to receive.

Thus we see the catchword is of no help in receiving. But at first it is a great help in sending, as it prevents confusion.

Briefly then, the idea is to be able to send so as to teach one's self to recognize .—.. as "L," etc.



What the Advent of Rogers Underground Aërials Did to Radio-Amateurdom—By H. B. Burney.

A BLINKER SIGNAL SET.

This device consists of a key, dry-cell buzzer, 2 point switch and lamp. The lamp is used for signaling at night, the key being used to make the dots and dashes which the lamp flashes. The buzzer is used when it is impractical to use the lamp.

First procure or make a wooden (small cigar box), just large enough to contain a dry (or flashlight) cell. On top of this box a strap key made from a strip of brass and with a poker chip for a knob is placed. A flat-headed screw serves as a contact point. In the center of the box is placed a box-type buzzer, and near the end opposite the key, a hole is drilled just large enough so that the lamp will fit snugly. A piece of tin is bent to the shape shown and serves as a shield to the operator's eyes. This also acts as a reflector. By using the hook-up shown, either the lamp or buzzer may be put in circuit by using the 2 pt. switch screwed to the side of the box.

Simple Blinker Signal Set to Aid In Learning the Code, with Lamp and Buzzer.

RADIO IN THE NAVY.

THE development of wireless by the Navy Department during the war has been so remarkable in many phases that it is almost unbelievable. Apparatus known before the war to only a few scientists and perhaps a few of the more progressive amateurs has been developed by the Navy and placed in practical use to such an extent that it has entirely revolutionized radio operation and will eventually be so applied in commercial work as to greatly increase the scope of radio communication. The work of the radio operator will be so broadened that he will rank as a highly skilled technical specialist.

The development of the radio telephone, radio compass, direction finder, submarine listener devices, etc., have depended largely upon the development of the "audion" and its application to radio communication. The use of the various methods for the elimination of static have permitted the employment of extremely sensitive audion receiving sets employing a number of steps of amplification. This depends, of course, upon the application of the audion. All of these things have so complicated the art of operation as to require a very much broader and technical course of instruction than has heretofore been found necessary.

The Navy Department has approved plans for the centralization of all instruction in radio work in one of the great training stations in the Middle West where they are now organizing a school comprising a course of instruction to cover all these modern phases of radio practise, together with a thoro course in practical electricity.

The development of radio during the war has so interested scientists and others in the many advantages to be obtained from its various applications that it is certain that it will never return to the comparatively limited field which it formerly occupied.

The future in store for those possessing thoro acquaintance of the modern phases of radio work is unlimited. The entire Navy personnel is now, practically, in the course of reconstruction and offers an exceptional opportunity for men interested in electrical and scientific lines. The Naval service has need of, and promises rapid advancement to anyone willing to put forth the same effort in the service as would be necessary for him to make a success in civil life. The opportunity to secure a training in the most modern phases of radio work cannot be duplicated elsewhere.

Those interested in the service may apply to the nearest recruiting officer and request from him information concerning enlistment as "Apprentice Seaman for Radio" or, should further information be required, write to the Officer in Charge of the Radio School, Great Lakes, Illinois.

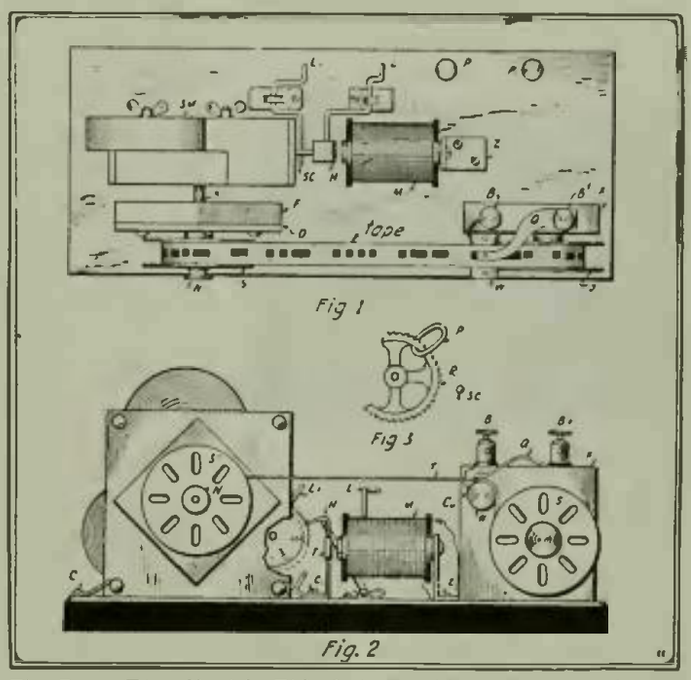
USE OF CONTACT DETECTORS IN RADIO MEASUREMENTS

By Dr. L. W. Austin,
U. S. Naval Radio Laboratory.

For many measurements in radiotelegraphy it is necessary to use a radio frequency-current indicator of known resistance. If the current to be measured is small it is generally customary to use a thermoelement and galvanometer. The most sensitive thermoelements are either of the vacuum type or the welded tellurium type. The vacuum thermoelements can be obtained of any desired resistance and are very sensitive, but are slow in action and frequently show a bad zero drift. In addition, the deflection usually shows considerable divergence from the current-square law. The tellurium platinum elements are quick acting and follow the current-square deflection law with sufficient accuracy for all practical purposes. They are, however, so fragile and difficult to manufacture and transport that no manufacturer has yet undertaken to supply them commercially. It is also impossible to make the contact resistance much less than 10 ohms. It is to be noted that the resistance in both the vacuum and tellurium types changes considerably with the amount of current flowing.

On account of the difficulties mentioned, the sensitive thermoelements in our laboratory have been replaced, for the most part, by a shunted contact detector circuit arranged as shown in figure 1. Here *LC* is any oscillating circuit having inductance and capacity, *D* is a contact detector, *G* a high resistance galvanometer, *K* a paper

Owing to Several Difficulties Experienced with Sensitive Thermoelements in the Radio Laboratory, the U. S. Naval Radio Laboratory Utilizes Instead the Unique Arrangement Here Shown. This Scheme Comprises a Shunted Detector Circuit, where L-C is Any Oscillating Circuit Having Inductance and Capacity; D is a Contact Detector; G a High Resistance Galvanometer; K a Tin Foil and Paper Condenser of One Microfarad Capacity, and R a Resistance Which May Have Any Value from 0.1 to 100 Ohms. The Greater Part of the Radio-Frequency Current Passes Thru R, While a Small Portion is Shunted Thru the Condenser K and the Detector. The D. C. from the Detector After Passing Thru the Galvanometer Returns Thru R. The Sensibility of this Arrangement is Much Greater Than That of the Best Vacuum Thermoelements of Equivalent Resistance.



condenser of one microfarad capacity, and *R* a resistance which may have any value from 0.1 to 100 ohms. The greater part of the radio-frequency current passes thru *R*, while a small portion is shunted thru the condenser *K* and the detector. The direct current from the detector after passing thru the galvanometer returns thru R. On account of the high resistance of the detector, the total resistance of the detecting system is practically identical with *R*, as has been experimentally tested between 0.1 and 100 ohms.

The sensibility of this arrangement is much greater than that of the best vacuum thermoelements of equivalent resistance.

In the case of most of the well-known detectors the proportionality between deflection and current-square is excellent. Galena, while the most sensitive of any of the detectors tried, shows a slight deviation from the square law. For absolute current measurements the system must of course be calibrated by comparison with a known thermoelement at the time of experiment.—*Journal Washington Academy of Sciences.*

Automatic Code Transmitter

I present herewith design of an automatic tape transmitter that I constructed and which runs very well. Details: Motor —This is an alarm clock which had "given up its ghost." I pulled it out of its case, removed the balance wheel, hair spring and the little lever—whatever its name is—and also the ratchet wheel, which I kept. I also removed the face, both hands and the driving mechanism for the hour hand. I then drove on the minute hand shaft a block of wood 2 inches by 2 inches by ½ inch, so that the shaft did not come quite thru the block (Fig. 1). On F I screwed a block of thin wood 2 inches by 2 inches with an 8/32 bolt 1 inch long thru the center of it, and a nut on the bolt (Fig. 1, K); on this bolt I put an empty typewriter spool, S, which I held on by bolt and nut (Fig. 1, N). Light spools for the purpose can easily be made up by the experimenter from fibre and brass odds and ends.

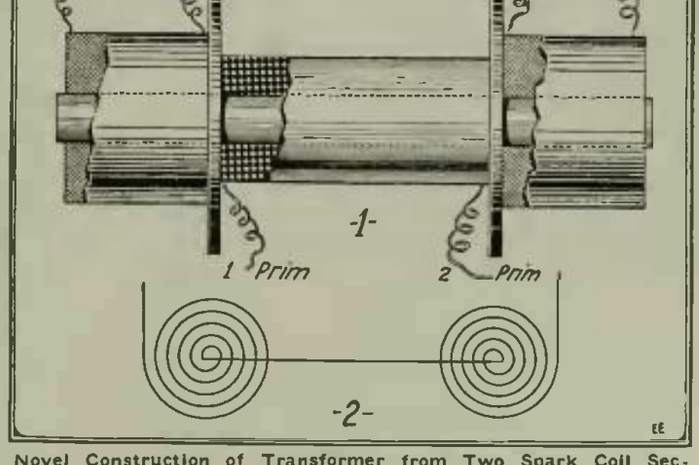
The Paper Tape Used In This Code Teaching Instrument Can Be Cut from the Border of a Newspaper, and the Dots and Dashes Punched in It With a Conductor's Ticket Punch.

Transmitter—On the base I fastened (Fig. 1, X) a wooden upright 2½ inches by 2½ inches by ½-inch in line with (Fig. 1, F). The peg, W, covered with copper sheet, Cn, is inserted in a hole in the wood; in W are inserted two small brads to keep the paper tape in proper alignment. Cu is connected to B and a fine brass brush, Q, bears on the tape and connects with Cu when an opening appears. S is another typewriter ribbon spool running on a headless wire nail.

Regulating Devices—Speed—The ratchet wheel aforementioned is treated by cutting out about one-third of it, Fig. 3, and also an oval of wire, P, is fastened loosely around the rim of the wheel (R); this ring hits on Sc, Fig. 1, which is a wire held in a spring binding post so it can be regulated. This regulator and the cut ratchet wheel are used to keep the spring motor from running away with itself.

Brake and Release—Consists of a thin copper spring, H, Fig. 2, fastened in common with one of the two clips which hold the motor down, H, has some sheet iron wound around it at T to form an armature, so that the electro-magnet, M, fastened on support, Z, can act on it.

The auxiliary release, L, is a bent copper wire (No. 14 B. & S. gage), which swivels on a spring post to release the brake H.



The electro-magnet is connected to binding posts, P and P, and is wound full of No. 28 B. & S. gage magnet wire.

GEORGE HARRINGTON.

A New Type of Transformer

A great many experimenters are in the position of having outgrown the "spark-coil" stage, but do not have the necessary funds to buy or construct a transformer using the 110 volt A. C. They are then burdened with a spark coil, which they usually attempt to use by means of an electrolytic interrupter, which will use an excessive amount of current without a very high degree of efficiency. In some cases the spark coil has been taken apart and an attempt made to use the secondaries. But it is easy to see that this cannot be done on the usual type of open-core transformer, for after winding three or four layers of heavy wire on a core about two inches in diameter, the total size is too great to permit the secondaries to be slipt on over the coil.

A plan that has given very good results is shown in the diagram. As will be noted, the primary is wound in the center of the core, *and a secondary slipt on each end.*

Novel Construction of Transformer from Two Spark Coil Secondaries, with the Primary Coil Placed Between Them.

The core is constructed of soft iron wire

Choke Coils--Theory and Design

By F. E. AUSTIN

Professor of Electrical Engineering, Thayer School of Engineering, Dartmouth College, Hanover, N. H.

THE writer who is constantly in receipt of inquiries from those desiring to know how to construct choke coils to meet certain requirements, takes this opportunity to explain somewhat briefly the theory underlying the

When a Coil of Magnet Wire Is Connected to an A. C. Circuit, the Current Is Measured by an Ammeter and the Potential by a Voltmeter. The Current Absorbed Depends upon the Number of Turns and Kind of Core Used in the Coil.

construction of choke coils, and to give directions for the construction and operation of such coils.

Choke coils are simply coils of insulated copper wire thru which alternating currents are allowed to pass and by means of which the *amount* of the alternating currents may be regulated as desired. The regulation is effected by the action of the counter-electromotive-force induced in such coils due to the continuously varying magnetic field set up by the varying alternating currents. The consideration of the variation of counter-electromotive-force is therefore the important question in the building and operation of all choke coils.

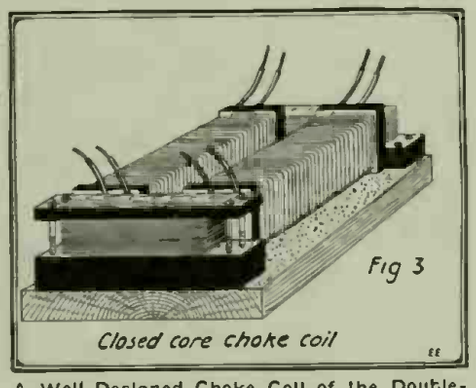
When a coil, formed by winding a number of turns and layers of double cotton covered copper magnet wire about an insulating tube of say hard fiber or cardboard has an alternating pressure applied to its terminals, as indicated in Fig. 1, an alternating current flows thru the wire of the coil according to the well known equation:

$$I_{ac} = \frac{E}{\sqrt{R^2 + (2\pi f L)^2}},$$ in which I_{ac}

denotes the current in amperes, indicated by an ammeter connected with the coil as indicated in the figure; E denotes the applied alternating pressure in volts, indicated by a voltmeter at V in the figure; R denotes the resistance of the coil in ohms, which may be measured by experiment, using a voltmeter and an ammeter with *direct current* or by the use of a Wheatstone bridge testing set, or which value may be *calculated* from the size of the wire and its length; f denotes the frequency of the applied pressure in cycles per second, and L denotes the so-called coefficient of inductance of the coil. Should a direct current pressure be applied to the terminals of the coil, the current would be exprest simply by Ohm's law as:

$$I_{dc} = \frac{E}{R}$$

It is evident by comparing the two equations, if the applied pressure *A. C.* and the applied pressure *D. C.* should have the same numerical value in volts, there would be much less resulting current according to the first equation than from the second, if the term exprest by $(2\pi f L)^2$ has any considerable numerical value. This of course depends upon the value of f and of L. The value of f is fixt by the value of the ordinary commercial frequencies of power circuits, ranging from 40 to 100 cycles per second, with 60 cycles as a very common frequency. The value of L depends upon the square of the number of turns on the coil, and very largely upon the material that is inserted into the coil to serve as a core.



The value of L is exprest by a unit called the *henry*, may be very easily and quickly ascertained by experiment for any coil, and may be quite accurately calculated from the number of turns wound on the coil, the area of cross-section of the central hole thru the coil and the length of the coil, when there is no iron or other magnetic material near the coil.

Let us examine somewhat carefully the first equation. First, suppose the value of f is O; then $2\pi f L = O$ and the equation becomes:

$$I_{ac} = \frac{E}{\sqrt{R^2}} = \frac{E}{R}$$ or Ohm's law.

When $f = 0$, the current is a direct current, and Ohm's law should be applicable. Next suppose $L = 0$; then also will

$$I_{ac} = \frac{E}{\sqrt{R^2}} = \frac{E}{R}$$ and Ohm's law again ap-

A Well-Designed Choke Coil of the Double-Pole, Closed-Core Type. One-half of the Winding Is Placed on Each Leg of the Laminated Sheet Iron Core.

plies. The value of L can be 0 only when the wire constituting the coil is not wound in the form of a coil; that is only when it is *straight*. The *A. C.* current in a straight wire is the same as the *D. C.* current if the numerical value of the *A. C.* pressure is the same as the numerical value of the *D. C.* pressure.

For illustration, suppose the value of L is, first, 1 *henry* and that $f = 60$. The numerical value of the term $(2\pi f L)^2$ becomes $(2\pi \times 60 \times 1)^2 = 377^2$; (very nearly). It may readily be appreciated that the $2\pi f L$ term has a very important bearing on the numerical value of I_{ac} when the values of E and R are fixt. The value of E is always fixt by the pressure of supply, the value of R is of course fixt when the coil is wound. Usually the frequency is also fixt by the frequency of the supply, which leaves L as the only variable quantity remaining that allows a variation in the current denoted by I_{ac}. After a coil is wound, the value of L is not variable unless the windings on the coil may be varied. This of course is not feasible except within rather narrow limits. The coil may be wound in sections, with taps, arranged for connecting with apparatus, thus allowing a variation in a comparatively few steps.

If the coil is provided with a movable iron core consisting of varnished iron wires, the means are provided for not only giving a very wide variation to L, but for making the variation absolutely gradual,

Suppose, for example, that a coil has an ohmic resistance of 5 ohms and a coefficient of inductance of .0162 *henry*. Find the current in the coil when an alternating pressure of 110 volts at 60 cycles is applied to the terminals of the coil? Making the proper numerical substitutions in the fundamental equation gives:

$$I_{ac} = \frac{110}{\sqrt{(5)^2 + (2\pi \times 60 \times .0162)^2}}$$

$$= \frac{110}{\sqrt{25 + (377 \times .0162)^2}} = \frac{110}{\sqrt{62.7}}$$

$$= 13.9 \text{ amperes.}$$

With an applied direct-current pressure of 110 volts the current in the same coil will be found from:

$$I_{dc} = \frac{110}{5} = 22 \text{ amperes.}$$

The coiling of the wire, therefore, accounted for $22 - 13.9 = 8.1$ amperes.

In order to reduce the current to 13.9 amperes on a direct current circuit, it will be necessary to introduce a resistance in series with the coil having a value of

$$R_x = \frac{110 - 69.5}{13.9} = 2.9 \text{ ohms.}$$ This may

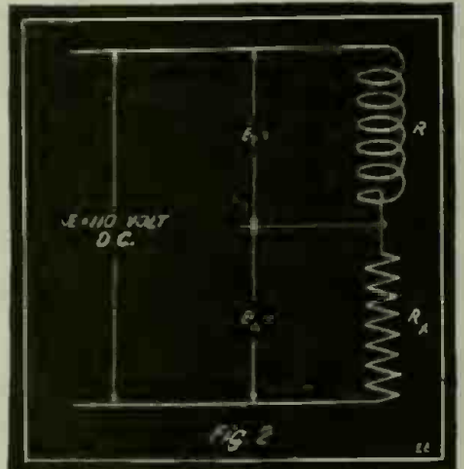
be understood better by consulting figure 2, which represents the coil connected in series with an auxiliary resistance R_x across a 110 volt circuit.

The current in this arrangement may be exprest by:

$$I_{dc} = \frac{E}{R + R_x};$$

and if the proper numerical values are substituted in this equation the result will be:

$$13.9 = \frac{110}{5 \times R_x},$$ from which



$$(5 + R_x)\ 13.9 = 110;$$

$$5 \times 13.9 + 13.9\ R_x = 110$$

$$13.9\ R_x = 110 - 5 \times 13.9$$

$$R_x = \frac{110 - 5 \times 13.9}{13.9} = 2.9 \text{ ohms.}$$

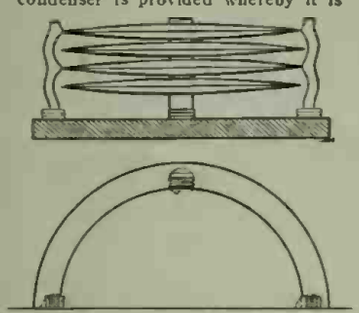
LATEST PATENTS

Luminous Attachment for Gun-Sights.

(No. 1,292,211, issued to Harold S. Young and F. H. Ihde.)

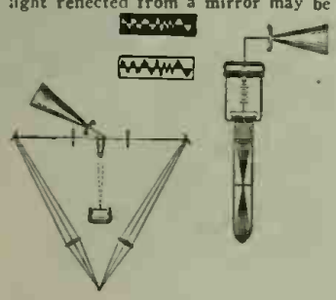


The sighting plate mounted on the front end of the firearm is coated with a covering of luminous paint, or some such other light-radiating pigment, which can be easily discerned at night. The benefit of this improvement in sights is that the marksman looking thru his rear sight can easily discern his forward point or sight due to the fact that the same is covered with this radium paint.

Electrical Condenser.

(No. 1,292,589, issued to R. F. Darmezen du Rousset and Chas. E. Brandt.)

It is a generally accepted fact that in electrical condensers formed of flat conducting surfaces separated by some dielectric the charge is unequally distributed from the center to the edges, its density being greater toward the perifery where the ruptures are always produced. In this new form of invention a condenser is provided whereby it is

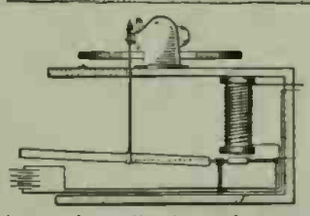


possible to localize the maximum tension at the central point of the system, and also increase the capacity for a given diameter. It consists of a number of discs arranged in the form of a quenched gap, wherein metal plates with concave surfaces are used, and between these various plates insulating discs are placed.

Photographic Phonograph.

(No. 1,291,702, issued to Frank W. Adsit.)

One of the principal points in this new invention is the providing of means for registering on a film the graphic representation of sound. Another object is to provide a means in connection with this film whereby a light reflected from a mirror may be



registered on either one side or the other of a center line down the film or on both sides of this simultaneously. It is also possible by special means to reproduce these graphic representations registered on the film, so that musical sounds or voice currents may be reproduced.

Automatic Record Stop for Phonographs.

(No. 1,291,985, issued to D. M. Manson.)

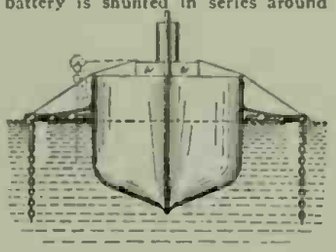
The principal innovation in this invention is an electrical means, whereby after a record has been played the needle will be carried back to the starting point, so that the playing of the record may be repeated. The invention as a whole consists essentially of an arm secured at one end to the sound box crook, magnetic means being provided for drawing down the opposite end of the arm, thereby raising the sound

box and needle from the record. Also a means is provided for counterbalancing the weight of the sound box during its return or downward movement. An ingenious scheme is devised whereby the tapered tube, by means of an adjustable stop, can be designed to be turned in any position to correspond with the starting point of the record, and a spring connected to the tapered tube and bracket, whereby the taper tube can be turned from the center of the record when the needle is out of contact with the record and brought back to the starting position.

System for Amplifying Variable Currents.

(No. 1,297,188, issued to Irving Langmuir.)

This invention is merely a means devised for utilizing an electron discharge and comprises several novel systems of connections whereby the weak currents can be reproduced as stronger currents. Taken as a whole, it is merely a modifica-

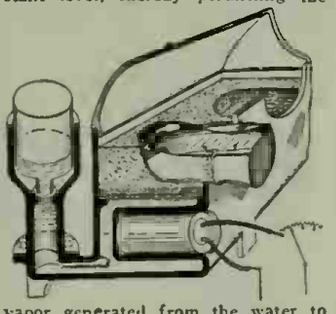


tion of the several step amplifier, as has appeared heretofore. In general it has some new points of interest, but taken as a whole, the invention boils down to the fact that it consists of a number of electron discharge devices connected in cascade for the amplification of currents. The bulb itself is made of quartz previous to an ultra-violet light, and into which are sealed in the usual manner an electron-emitting cathode and anode. The cathode of this particular bulb consists of potassium or sodium, which will emit electrons when illuminated by a source of light.

Magnetic Protector for Ships.

(No. 1,293,539, issued to John and Sophie Pies.)

The principal device is a form of arm extending from the ship on each side attached to an electro-magnet with a flexible chain hanging in the water, and arranged with a number of floats to depend from these extending arms. One circuit is formed in series with these magnets to a large generator, and the battery is shunted in series around

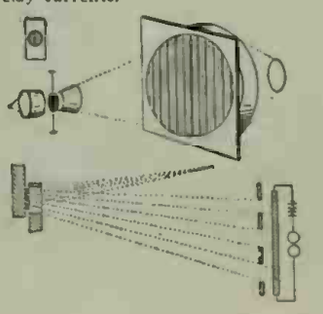


the two chains that hang from either side of the ship. The apparatus is arranged to detect submerged torpedoes, mines, etc., due to the fact that their presence would increase the conductivity between these two chains and cause the circuit to be closed and ring the bell.

Electrically-Heated Apparatus for Moistening Shoes.

(No. 1,294,533, issued to W. W. Reed.)

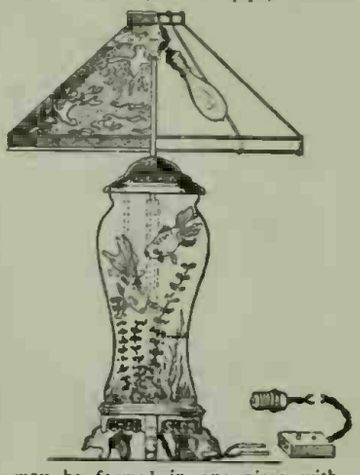
It has been found that much of the cracking and breaking of shoes incident to the lasting operation can be avoided by preliminarily treating with a hot vapor. A tank is provided which will maintain the water automatically at a constant level, and an electrical heating unit arranged to heat the water. A layer of absorbent material is placed on top of the heated water, and an automatic means provided for maintaining the upper surface at a constant level, thereby permitting the



vapor generated from the water to be diffused equally around all portions of the shoe.

Selenium Relay.

(No. 1,293,098, issued to A. N. Hovland.)

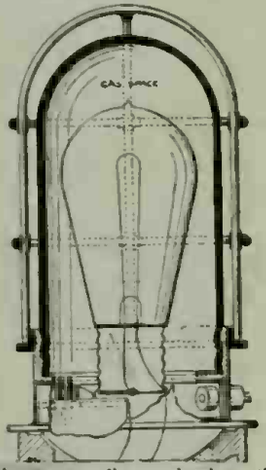


This new form of relay is built on the principle that a conducting wire placed in a magnetic field will be displaced laterally when an electric current is past thru the same. This fact is made use of, for instance, in wire galvanometers and in light-writing apparatus, also that the magnetic field is used to produce a very sensitive relay, utilizing one or more photo-electric cells on the general type of a selenium cell. A shutter means is provided for decreasing and increasing the resistance of the cell, and by such means it is possible to relay currents.

Illuminated Aquarium.

(No. 1,297,254, issued to Natsuo Sato.)

A novel and attractive improvement on the usual form of aquarium, which consists of a bowl which is permanently illuminated from above by electric lamps, and which are concealed in the lamp, and intended for use in drawing rooms. It consists of a metallic tube which runs up centrally thru the apparatus, and thru which tube also is run electric wires to operate the bulbs under the lamp shade. Were this tube to be in actual contact with the water, it might possibly cause some chemical reaction, which would be detrimental to the fish in the bowl. The inventor overcomes this by using a glass tube over the metal pipe, which

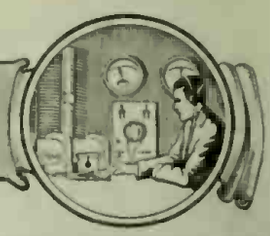


may be formed in one piece with the bowl or may be separate and cemented together in order to prevent leakage. The bottom of the bowl is arranged to present a pleasing appearance with a bed of sand.

Electric Gas-Detecting Safety Lamp.

(No. 1,294,806, issued to C. G. Hunt and John H. Coyle.)

The main feature of the invention consists of a lamp and a sealed chamber, with a source of light in said chamber. A means is provided whereby a gas pressure inside the



chamber normally maintains the light, but if fumes are present on the outside, this external pressure will cause the light to be extinguished. It operates on the principle that the internal pressure of the gas will normally maintain the light, but should the gas pressure in the chamber be brought to an inferior or superior pressure to that without the chamber, then the light will be extinguished.

WITH the AMATEURS

Our Amateur Laboratory Contest is open to all readers, whether subscribers or not. The photos are judged for best arrangement and efficiency of the apparatus. To increase the interest of this department we make it a rule not to publish photos of apparatus unaccompanied by that of the owner. Dark photos preferred to light-toned ones. We pay $3.00 each month for the best photos. Address the Editor, "With the Amateurs" Dept.

"Amateur Electrical Laboratory" Contest

THIS MONTH'S $3.00 PRIZE WINNER—J. CARROLL TOBIAS

I AM an appreciative reader of your magazine and wait anxiously for it to arrive from month to month. I find lots of enjoyment in looking over the photos of Amateur "Labs", and so am sending a "shot" of my own little workshop.

In this room many interesting and educational experiments are performed in chemistry, electricity, metallurgy and electro-chemistry. I have apparatus for both qualitative and quantitative analysis, electric furnace analysis of iron, steel and carbon compounds and for the analysis of coal gas and by-products. A complete bacteriological outfit is also one of my valued possessions and by its means microscopic examinations of water are conducted. This about completes the chemical end.

In the electrical division I have motors, a generator (A.C., 60 volt, 60 cycle), a 50 watt D.C. generator, step-down and step-up transformers, high frequency alternator, high-frequency high-voltage transformer, Oudin coils, Tesla coils and spark coils. I have an electric arc furnace by means of which I conduct small experiments in the production of synthetic gems, electrolytic rectifier, electrolysis apparatus and "bunches" of other "junk". At present I have under construction an A.C.-D.C. switchboard, also a three-step audion amplifier and two long wave loading coils. When the "Lab" is drest out in all its new furniture, I will send you another series of photos.

Another photo shows my radio set which has just been unsealed and which I know is just "hankering" to have the old oscillations flowing once more thru its coils. Another view shows my battery switchboard and electrical work bench with spark coils, Tesla coil, Oudin coil and other "stuff".—J. Carroll Tobias, 106 N. High St., Bethlehem, Pa.

HONORABLE MENTION (One Year's Subscription to the ELECTRICAL EXPERIMENTER) —CHESTER A. WRIGHT

Herewith are photos of my radio station. I have been a steady reader of the ELECTRICAL EXPERIMENTER for some time and get many good ideas and hook-ups. My apparatus is mostly home-made, consisting of a condenser made of heavy plate glass with aluminum sheets. The rotary spark gap is made of a 1700 R.P.M. fan, and the disc of an Edison disc record. It gives a very good tone. My oscillation transformer is made of heavy brass ribbon and is very easy to adjust. I use a Clapp-Eastham 1 K.W. transformer. My receiving apparatus consists of home-made couplers from which some very close tuning can be had. I use an audion and galena non-jarable detector, both with great results. I also have Murdock variable condensers, and two sets of Brandes' phones.—Chester A Wright, 611 Green St., Greensburg, Pa.

Science in Slang

By EMERSON EASTERLING

"A FUNNY thing happened the other day," laughed Punk Loomis. Stokes looked up from the telephone directory. "A guy," continued Punk, "was standing under a belt in the factory. The fellow had on rubber boots. He was talking to his wife, and when she started to leave—you see, they were newlyweds—he reached over to kiss her. WOW! You ought to have seen them! One of them got it in the nose—the other on the lips—and it cracked like a young bolt of lightning. You see, the rubber boots made a Leyden jar out of the man—a human condenser. That kiss sure had a kick."

"I guess that was about as funny to them as it was to the lady who was cleaning clothes and set the rag, saturated with gasoline, on fire in her hand by drawing a spark from the friction of the wool and silk. Both were static, you know." Here he turned and walked to the telephone and asked for long distance. In a few minutes he returned.

"Quite a commodity, this telephone. In the old days when the citizens thought it proper to run in marathons in the 'altogether,' if I should happened to have been let loose at that time, and happened to have gotten word to a guy the same distance as the present case here, I should had to have waited for at least a week—with the best runner that the country had, to tell the adjoining country to go to hades—for the answer."

"Can you reel off another sentence like that without stopping for air again?" asked Bender.

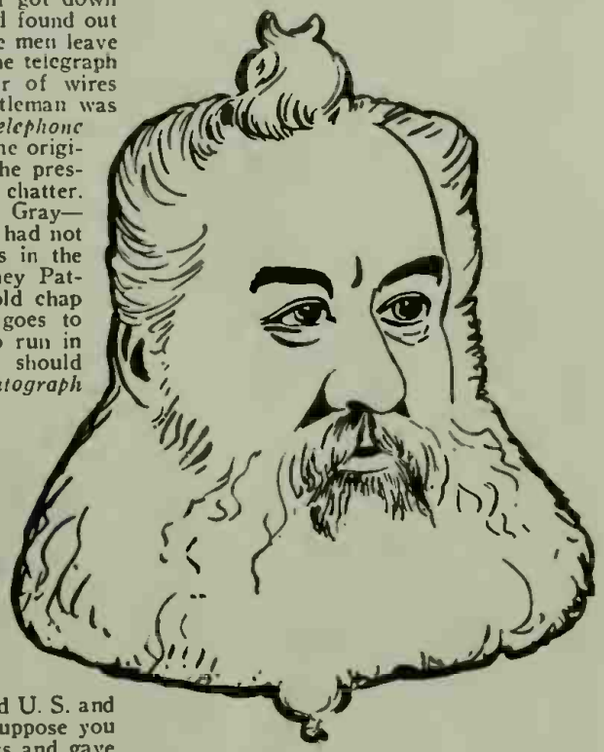
"Jumping over such improvements as Paul Revere and the pony express brought about, we land up at the chapter in scientific history where a bird by the name of Morse, with three other names before it, two of them Sam and Finley—I don't know the other—it don't make much difference anyway. What we are driving at is the fact that after muttering, 'If the presence of electricity can be made visible in any part of the circuit, I see no reason why intelligence may not be transmitted by electricity,' he rigged up a couple of magnets and an arm and anvil—behold! We have the *telegraph sounder*. Then the next thing was to contrive a series of dots, dashes and spaces to convey that intelligence he was speaking of. It took a lot of salesmanship for Sam to get his trick across, but perseverance wins out in the finale—so, first act in the comedy of the telegram.

Sam Finley Morse, the Dash and Dot Kid, Also the Ancestor of the Telegraph Messenger.

Keeping the Wires Hot

"Then another guy—you've heard of him, Bell, Alexander Graham, Proff. in vocal hygiene or physiology—drops in on us. This student of the art and mechanics of the first cause for conversation got down into the throat of the matter and found out a lot about the reason why some men leave home. While trying to make the telegraph do more work for the number of wires used, it is related that this gentleman was alleged to have developed the *telephone*—but none would recognize in the original article any resemblance to the present instrument of long-distance chatter.

"Another duck—Prof. Elisha Gray—would have landed the fish if it had not been that Bell got his draftings in the patent office (no, not the Phoney Patent Offizz) and beat the dear old chap out of the glory. Which all goes to show that some great minds do run in the same channel. But Gray should worry. He is guilty for the *telautograph* being on the market. No, he is not Elisha of the fiery chariot.



"Europe was a long way off until Cyrus Field succeeded in stringing an *undersea cable* between the two continents in one piece. That made him get in rich with Congress, and he got a medal to show his friends for the stunt, too. It was in 1858—the time that George Washington was fighting the battle of Waterloo—that the cable had one end in the good old U. S. and the other in Europe. I don't suppose you care, but Cyrus gave a few kicks and gave up in the city of New York, 1892.

"You know of Nick Tesla (his picture is on one of the other pages), the fellow that pulled one over on Columbus in the egg stunt. Well, he just had to do something for the telephone and invented a *repeater* for it. Then Tom—who? Edison—improved it a lot. And a gob of other guys boosted the proposition along. Some wise guy hops along and steps on two circuits, and sticks another to work on the same lines—Hoovering on wire. It was on the same order that Bell tried to do with the telegraph, only different. They dubbed it the *phantom circuit*, altho it is not as mysterious as the name implies. Then along comes the *multiplex system*, words and music by Major General Georgie Owen Squier, Chief Signal Officer of the United States Army, and right away he goes the phantom circuit one better by letting five talkers in on the line simultaneous together and at the same time. Not only that, but it lets a crowd of 'brass pounders' in on the circuit at the self-same operation, *tout de suite*.

"De Forest, in his wireless experiments, slipt them the pass to get in on that stunt by creating the *Audion*. That is why the system is referred to as the *wired wireless*.

"By combining wireless and the lines together, we get some pretty long distances covered by the voice. Not so long ago when some notable English guy listened to both oceans at the same time over the telephone we thought it was grand. To-day that's commonplace. Now, if the guys around the player stop coughing, and they have good conditions and sensitive instruments, it is possible to hear Hawaiian hula players do their song and dance in New York City over the wire and wireless.

"I doubt if Sam Morse knew what he really did when he constructed his first telegraph instrument. Just think of the

Prof. Alexander Graham Bell, the Glnk Who Invented the Hello Girls.

war and sporting (accent on the sporting) wires! What would we do without them? Take the business as a whole. We would feel like we were lost without 'phones and 'wires.'

"When the real thing marches in, a load of by-products comes out on the next section. When Edison called up over a 'phone and instead of saying 'Are you there?' or 'Is this you?' he said 'Hello!' That took like 'Over the top,' 'Lay on, McDuff' and such slogans, saws, or what-you-call-'ems. Now we would think a boob crazy were he to say 'I am talking—is there anybody on the other end of the line?' 'Hello' is good anywhere, China, Africa, or Chile, but not in France, where it is 'Alloh.'

"Now, if we can only get rid of the central station," said Punk Loomis, "and replace the live hello-girl with an automatic one that will not get tired or angry when the customers cuss over the 'phone, then we will have it down pat."

"You're 'way behind the times," came back Stokes with an impatient gesture of his head. "What you want to do is to take a flying trip to Chicago and give their automatic telephone rinktum the once over. And, believe me, it is some contraption. Of course, Windy City citizens have the regular Bell 'phone also, so when they get tired of cussing the hello-girls they can switch to the automatic, which is some indoor sport. The two systems necessitate the use of two telephones in one office, and on any Monday morning you can see your Windy citizens doing the hula-hula trying to talk into two phones and to two cus-

www.americanradiohistory.com

THE ORACLE

The "Oracle" is for the sole benefit of all electrical experimenters. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be published. Rules under which questions will be answered:

1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered.
3. Sketches, diagrams, etc., must be on separate sheets. Questions address to this department cannot be answered by mail free of charge.
4. If a quick answer is desired by mail, a nominal charge of 25 cents is made for each question. If the questions entail considerable research work or intricate calculations a special rate will be charged. Correspondents will be informed as to the fee before such questions are answered.

ROTATING MAGNETIC FIELD QUERY AND ROGER'S RADIO SYSTEM.

(1004) J. M. McDonald, St. Louis, Mo., writes:

Q. 1. Asking several questions about the rotating magnetic field and Tesla "electric egg" apparatus.

A. 1. We give you the following suggestions in answer to your questions. The rotating magnetic field is very clearly explained in the April number of the ELECTRICAL EXPERIMENTER, containing an article by Dr. Nikola Tesla on his induction motor and how it works, which we are sure will make the matter plain to you, as a clear hydraulic analogy is given therewith.

In connection with the "electric egg" apparatus, we would advise that the two opposite coils are connected so as to give North and South poles respectively.

Elsewhere in the present issue you will find a special article on the "Rogers' Underground Wireless System for Amateurs." This will answer many questions such as the one you ask concerning the length of aerial, etc., and briefly we might say that for short wave lengths of about 200 to 300 meters, a wire (rubber covered auto-cable) about 300 feet in length could be used. When the free end of the wire is grounded, the signal strength is reduced. Generally speaking, and for ordinary amateur and even commercial requirements, but one wire is found necessary.

VALUE OF THE "SOLAR CONSTANT."

(1005) Emmanuel Bellon, Peoria, Ill., writes this department:

Q. 1. About the value of the mean "solar constant."

A. 1. There seems to be indeed much promise in the development of an efficient solar energy plant, and while little has been done along this line in a commercial way of late, yet some very interesting work has been accomplished by a number of scientists, who have worked on the problem. It is a most interesting and valuable field to work in.

The result of nearly seven hundred tests conducted by the Smithsonian Institute of Washington and in various parts of the world, has resulted in accepting 1.93 *calories per square centimeter per minute*, as the mean "solar constant." This is equivalent to 7.12 British thermal units per square foot per minute. The best body for the conservation of the radiant energy into heat energy is a dead black one.

RADIO QUERIES ON MIGNON RECEIVING SET.

(1006) A. S. ———., Chicago, Ill., inquires of the Oracle:

Q. 1. What is the coil around the Audion used for in the Mignon receiving set, and also what is the object of the metal coupler core?

A. 1. Concerning the Mignon type R. W. No. 3 radio receiver, would advise as follows:

Regarding the two specific points you mention first, about the coil around the Audion tube, this is hooked up with one of the tuned oscillatory circuits, so that the oscillating magnetic field created within it, would act electromagnetically on the electron stream within the detector, somewhat in the same manner as is the case where a permanent steel magnet is placed in proximity to a vacuum tube detector to improve its operation. The effect on the electron stream is to either concentrate it or spread it, thus making the path from grid to plate either more conductive or less conductive, depending upon the polarity and position of the magnetic field.

To Our "Oracle" Friends

Do you realize that not one day passes when we do not receive from 150 to 250 letters address to "The Oracle"? If we were to publish all the questions and their answers we would require a monthly magazine five or six times the size of the ELECTRICAL EXPERIMENTER, with no other matter but questions and answers. Of late the influx of letters has become so heavy that several of our associates have been forced to discontinue important editorial work, in order to answer the mail. This we are certain you do not wish. You do not want your magazine to lower its present high standard. You want the best, the very best, and you know we never have failed you yet.

Moreover the multitude of letters are wholly unnecessary. Most of the questions Readers ask every day have been answered before in "The Oracle." Therefore, ere you sit down to write us, look over your back numbers, and nine times out of ten you will find the answer.

We strive hard to publish only such matter as has not appeared before in our columns, and for that reason, only a small fraction of the queries received by us are actually publisht.

Your magazine is steadily coming to the fore as the greatest publication in the scientific world. To keep up its present high standard and to make it a better and bigger magazine requires a tremendous amount of untiring effort on the part of the Editors. Therefore, in the future, we CANNOT in your own interest, answer questions by mail, free of charge.

For questions requiring an immediate answer our fee is 25 cents for the first three ordinary questions, and 25 cents for each additional question. We will gladly advise fee for special questions entailing considerable research work or calculations.

Stamped and addrest envelope should be enclosed with the queries, and moreover, any sketches accompanying them should be drawn in ink on separate sheets. Write plain and, PLEASE, PLEASE BE BRIEF.

Editor of "The Oracle."

Concerning the disc core transformer in the Mignon coupler, so far as we understand, this disc core was either of iron or some other alloy of a ferrous nature. Apparently the designer aimed to or tried to give the impression that this form of transformer would be much more efficient than the standard radio coupler, owing to the presence of the ferrous core, which of course would give a much higher permeability, or flux carrying power.

We refer you to the March, 1917, issue of the ELECTRICAL EXPERIMENTER, page 811, where you will find complete diagrams and explanation of the Mignon adjustable disc core receiving transformer and circuits, written by Mr. Ernest Mignon, the inventor, himself.

RECORDING RADIO SIGNALS

(1007) W. T. Smith, Stockton, Kansas, wishes to know:

Q. 1. Of methods in use for recording radio-telegraphic signals.

With reference to apparatus sufficiently sensitive to record wireless signals at considerable distances, would suggest that you look over the article entitled, "Radio Amplifiers," which appeared in the November, 1918, issue of the ELECTRICAL EXPERIMENTER. A great number of different types of amplifiers are there described, and data is also given on their make-up.

Finally, we would suggest that there are two methods now in use commercially for recording wireless signals. The first one, which is employed at the Marconi Trans-Atlantic Radio Stations, utilizes two to three stage vacuum valve amplifiers, and the signals are recorded on a phonograph or "Dictaphone." The second method is that which has been used by the De Forest engineers, and this system of recording wireless messages or signals, utilizes two, three, or higher Audion amplifiers to boost the signals to a sufficient strength to operate a polarized relay. This, in turn, actuates a Morse register or tape recorder. The De Forest people have also successfully employed a Poulsen *telegraphone* for recording the signals after amplification by an Audion amplifier.

It might interest you to know that the De Forest experts have perfected a six-stage Audion amplifier with an *amplifying capacity of one million times.*

DESIGN OF PHONOGRAPH HORNS.

(1008) Howard L. Quick, Jr., Brooklyn, N. Y., wants data as follows:

Q. 1. How a large phonograph sound chamber or horn should be built?

A. 1. Relative to construction of phonograph sound box or horn, which in every case should be of some hard wood, an eminent sound authority, Prof. Dayton C. Miller, gives data as follows: The horn is best constructed of some hard wood such as maple, mahogany, hollywood or oak. The

Learn Electricity

In the Great Shops of COYNE IN 3½ MONTHS

Thousands of Electrical experts are needed to help rebuild the world. Come to Chicago to the great shops of Coyne and let us train you quickly by our sure, practical way, backed by twenty years of success. Hundreds of our graduates have become experts in less than four months. *You* can do the same. *Now* is your big opportunity. Come—no previous education necessary.

Earn $125 to $300 a Month

In the Electrical business. Come here where you will be trained in these great $100,000 shops. Experts show you everything and you learn right on the actual apparatus. You work on everything from the simple bell to the mighty motors, generators, electric locomotives, dynamos, switchboards, power plants, everything to make you a master electrician. We have thousands of successful graduates. Just as soon as you have finished we assist you to a good position.

Become an Expert in 3½ Months

No need of taking from 1 to 4 years to become an expert, we have proved this in thousands of cases. The Coyne method of practical training eliminates all books, useless theory and other non-essentials and trains you in just what you need to know to become an expert.

Earn Your Way

Don't tell yourself you haven't got the money to come to Coyne. If you have ambition and the nerve of a real man, that's all you need. Dozens of our students every year work in their spare time and earn their living expenses. Dozens of others work in the day time, earn all their expense and attend our evening school. Our employment department will help you without charge.

Day or Evening Courses

Don't worry about the money. Anyone with ambition can learn here. Our tuition is low with small easy payments if desired. All tools and equipment is furnished free. Our students live in comfortable homes in the best section in Chicago—on the lake—just a few minutes' walk from our school.

Electricity, Drafting Motion Picture Operating Plumbing

We teach all these trades and professions quickly and in such a thorough, practical way that when finished you are ready to step right into a position of responsibility and big pay.

Send Today for Big Free Book

Write today, *now*, for the book. It tells what Coyne graduates have done. What you can do. Fill in the coupon, check the trade you are most interested in or send a postal card, do it *now*.

Learn Drafting

The country is crying for skilled draftsmen in all lines. Thousands of positions open with princely salaries. We give you the advantage of our big shops. No other school can do this. Now is the time to get into this big field. Experts train you under practical working conditions, no books and theory go here. Check drafting on the coupon below and mail it *at once* for full particulars.

Health-Beauty-Power

Treat Yourself in Nature's Way

The Therapeutic White Rays of the Sterling Lamp are a scientific adaptation of the marvelous healing properties of the sun's rays. The warm, soothing, soft, white rays penetrate and vitalize every cell and tissue; new cell growth is stimulated; the body is refreshed and vitalized.

It brings you a clear, unblemished skin, rose-tinted cheeks, bright eyes; quickens the sluggish blood, rebuilds firm new muscle, and clear, new skin.

STERLING THERAPEUTIC LAMP

"The Light That Heals"

Relieves pain without destroying vitality. Absolutely safe; no vibration, shock or pain. Does away with use of harmful drugs. Relief from pain results the moment you snap the electric switch. Rheumatism, neuralgia, sore throat, earache, goitre, headache, nervous conditions, and innumerable other ailments, are instantly eased and relieved. Invaluable in the treatment of skin diseases. Physicians endorse and recommend Therapeutic Light to you.

Send Coupon for Free Book

Nothing vague or mystic in the Sterling Lamp. Our free book tells of its uses and many benefits—deals with the simple, fundamental laws of health and beauty. Tells you how to treat yourself at a few cents in cost, relieving you of pains and ailments and awakening your energy; how others in hospitals, sanitariums and thousands of private homes have benefited. Don't suffer headaches and other pains needlessly—let Nature and Science help you to health, beauty and greater vitality.

THE ORACLE

(Continued from page 144)

wood for ordinary size horns may be ½ to ¾ inch stock, finished perfectly smooth inside and preferably varnished. Glue the joints and do not nail them. Mahogany is very well suited to the purpose indeed. The wood stock used should be quite thick, as the whole principle of the phonograph sound chamber is to vibrate the column of air within the chamber, and with this object in mind, and as pointed out by some of the highest scientific authorities on acoustics, the walls forming the chamber should not be thin enough to vibrate, but should be *rigid, so that the column of air can vibrate freely, and only this column of air.*

The longer the horn the better, and as the wave length in air of the average voice, such as the *baritone*, is about 4½ feet, the total mean length of the sound chamber from the reproducer should not be less than this value. Providing the sound chamber has at least this length, and that the diafram of the reproducer is large enough, say at least 2½ inches, so as to vibrate at the usual range of frequencies predominant in speech and music reproduction, then you should obtain very good results.

A high authority in the field of acoustics recently mentioned to the Editor of this column that the best phonograph music he ever heard in the laboratory, was that given from a wooden horn seven feet long, which took care of all the longer as well as the shorter wave lengths and frequencies. Very fine results were obtained from a still more rigid horn, constructed of concrete, he stated.

This authority also mentioned that a very slight difference was noted as to whether the sound chamber was made *square* or *round* in cross-section. The lines of its length should expand continually and not be parallel. Furthermore, the general contour or shape of the walls of the horn may be made perfectly straight, and no increased efficiency is obtained by any fancy frills or curves in the horn, as is claimed by many phonograph companies. Also it is a proven fact by laboratory tests, that any form of wooden grill or vane whatsoever placed in the mouth or opening of the sound chamber, only lowers the tonal and acoustic efficiency of the instrument.

With regard to needles, it is also interesting to note that tests have shown where anything softer than a steel, diamond or saffire point is used, that pure and clear sound reproduction is sacrificed, such as when fiber needles are used. Prof. Miller stated the situation very succinctly and correctly, we believe, when he said that "If you use fiber needles and like them, then use them, as they of course effect a saving in the wear on the records." The fact remains however, that any such needle as this absorbs a considerable portion of the vibrations of the music picked up from the record, and dissipates it before it ever reaches the diafram. The same reasoning applies to many other fancy attachments offered to the phonograph public.

A. C. MOTOR STARTING COIL CONNECTIONS.

(1009) G. S. Golden, Harrisburg, Pa., writes:

Q. 1. How do you connect up the starting coils on an A. C. single phase induction motor?

A. 1. We give herewith diagram of connections for the four starting coils on your A. C. motor. The current must flow around the successive poles in an opposite direction,

(Continued on page 148)

Advertising Talks

NUMBER 3

LAST month I showed you how necessary it was to the life and growth of a big magazine like the ELECTRICAL EXPERIMENTER to have a large number of satisfied advertisers, and explained how more advertisers meant a bigger magazine for you and more reading matter. This month I want to give you a few more reasons why it is worth your while to patronize firms who advertise, and especially those who advertise in the EXPERIMENTER.

When you pay your good money for some article, no matter what it is, you want to get the very best quality possible for the money. Advertised articles are always of better quality than unknown, unlabeled, and unbranded goods. This is easily proven. Compare such well-known brands as the Sonora Phonographs, Starrett Tools, Brandes or Murdock Receivers, etc., with similar articles put out by firms who have not the ambition or progressiveness to standardize their merchandise. The comparison always proves the superiority of the advertised article.

There is a good reason why this is so. It costs money to advertise. An inch ad in the ELECTRICAL EXPERIMENTER costs $8.40 for one insertion—a page ad $264.60. An advertiser who is using ten or twelve magazines and spending anywhere from $1,000 to $10,000 a month to tell you about the goods he has for sale, must get his money back by keeping you as a steady customer. It costs too much to make the first sale to drop your friendship then and there. He must make you a strong booster of what he has to sell, and keep you a steady customer if he is to make money. The only way he can do it is by giving you better quality and a cheaper price than possible anywhere else. If he doesn't give you a better article and save you money you won't remain a steady customer and he loses.

Therefore, when an advertiser spends a small fortune each year to build up a reputation, don't think for a single moment that he is going to risk that reputation or run the chance of having his money thrown in the gutter by putting out inferior goods. Far from it! The advertiser lays his cards on the table. He says, "Here's who I am, and what I am and what I have to sell you." He is frank with you. He does not try to "stick" you. He cannot afford to.

When you send your orders to any concern which advertises in the ELECTRICAL EXPERIMENTER you know that you are sending them to a reliable firm (we do not accept advertising orders from any concern except those that we know are reliable.) You will know that the goods which you will get are the best that you could buy for the money. You will know that the advertiser stands back of his goods and is willing to make good if any dissatisfaction should arise.

I have given you only a few reasons why it is a business proposition for an advertiser to give better service, put out a better quality of goods, and offer you more for the money than you would get from a non-advertiser. There are many others. Next month I will take up the matter of costs and prices and show you just how the advertiser can sell goods more cheaply than his competitor.

Advertising Manager.

How to Increase Your Will Power In One Hour

Author of This Article Tells How He Quickly Acquired a Dominating Will Power That Earns Him Between $50,000 and $70,000 a Year

FOUR YEARS ago a man offered me a wonderful bargain. He was hard up for money and wanted to sell me some shares in a young, growing company for $1,000. Based on the earnings of the Company the stock offered me was easily worth $5,000—in fact, the man who finally bought the shares sold them again in five months *at a profit of* $4,300.

The reason I didn't buy the shares was that I could no more raise a thousand dollars than I could hop, skip, and jump across the Atlantic Ocean. A thousand dollars! And my income only twenty-five a week.

The second chapter in my life began a few months later, when another opportunity came to me. It required an investment of $20,000 during the first year. I raised the money easily, paid back every penny I borrowed, and had $30,000 left at the end of the first year! To date in less than four years, my business has paid me a clear profit of over $200,000 and is now earning between $50,000 and $70,000 a year. *Yet for twelve years before, the company had been losing money every year!*

The natural question for my reader to ask is, "How could you borrow $20,000 to invest in a business which had previously been a failure, after being unable to borrow $1,000 for an investment that seemed secure?" It is a fair question. And the answer can be given in two little words—*WILL POWER.*

When the first proposition came to me I passed it by simply because I didn't have the money and couldn't borrow it. I went from one friend to the next and all turned me down. Several refused to talk business with me at all. They all liked me personally, and they asked about the kiddies, but when it came to money matters I hadn't a chance. I was scared stiff every time I talked to one of them. I pleaded with them, almost begged them. But everybody had their "money all tied up in other investments." It was an old excuse, but I accepted it meekly. I called it hard luck. But I know today that it was nothing in the world except my lack of Will Power or rather my weak Will Power, which kept me from getting what I wanted.

Partial List of Contents

The Law of Great Thinking.
The Four Factors on which it depends.
How to develop analytical power.
How to think "all around" any subject.
How to throw the mind into deliberate, controlled, productive thinking.
Detailed directions for Perfect Mind Concentration.
How to acquire the power of Consecutive Thinking, Reasoning, Analysis.
How to acquire the skill of Creative Writing.
How to guard against errors in Thought.
How to drive from the mind all unwelcome thoughts.
How to follow any line of thought with keen, concentrated Powers.
How to develop Reasoning Power.
How to handle the mind in Creative Thinking.
The secret of Building Mind Power.
How the Will is made to act.
How to set your Will.
How a strong Will is Master of Body.
What creates Human Power.
The Six Principles of Will Training.
Definite Methods for developing Will.
The NINETY-NINE METHODS for using Will Power in the Conduct of Life.
Seven Principles of drill in Mental, Physical, Personal Power.
FIFTY-ONE MAXIMS for Applied Power of Perception, Memory, Imagination, Self-Analysis, Control.
How to develop a strong, keen gaze.
How to concentrate the eye upon what is before you—object, person, printed page, work.

These are only a few of the many subjects treated.

When I heard that the man sold those shares at a profit of $4,300, it seemed that my sorrow could not be greater. That profit was just about what my salary amounted to for four years! But instead of grieving over my "hard luck," I decided to find out why I was so easily beaten in everything I tried to accomplish. It must be that there was something vital that made the difference between success and failure. It wasn't lack of education, for many illiterate men become wealthy. What was this vital spark? What was this one thing which successful men had and which I did not have?

I began to read books about psychology and mental power. But everything I read was too general. There was nothing definite—nothing that told me *what to do.*

After several months of discouraging effort, I finally encountered a book called "Power of Will," by Prof. Frank Channing Haddock. The very title came to me as a shock. When I opened the book I was amazed. I realized that will power was the vital spark—the one thing that I lacked. And here in this book were the very rules, lessons and exercises through which anyone could increase their will power. Eagerly I read page after page; including such articles as The Law of Great Thinking; How to Develop Analytical Power; How to Concentrate Perfectly; How to Guard Against Errors in Thought; How to Develop Fearlessness; How to Acquire a Dominating Personality.

An hour after I opened the book I felt like a new person. My sluggish will power was beginning to awaken. There was a new light in my eye, a new spring in my step, a new determination in my soul. I began to see, in my past, the many mistakes I had made, and I knew I would never make them again.

I practiced some of the simple exercises. They were more fascinating than any game of cards or any sport.

Then came an opportunity to acquire the business which had lost money for twelve years, and which I turned into a $50,000 a year money maker. Instead of cringing before the moneyed people, I won them over by my sheer force of will. I would not be denied, and my every act and word since then has been the result of my training in will power.

I am convinced that every man has within himself every essential quality of success except a strong will. Any man who doubts that statement need only analyze the successful men he knows, and he will find himself their equal, or their superior, in every way except in will power. Without a strong will, education counts for little, money counts for nothing, opportunities are useless.

I earnestly recommend Prof. Haddock's great work. "Power of Will," to those who feel that success is just out of reach—to those who lack that something which they cannot define, yet which holds them down to the grind of a small salary.

Never before have business men and women needed this help so badly as in these trying times. Hundreds of real and imaginary obstacles confront us every day, and only those who are masters of themselves and who hold their heads up will succeed. "Power of Will" as never before is an absolute necessity—an investment in self-culture which no one can afford to deny himself.

I am authorized to say that any reader who cares to examine "Power of Will" for five days may do so without sending any money in advance. If after one hour you do not feel that your will power has increased, and if after a week's reading you do not feel that this great book supplies that one faculty you need most to win success, return it and you will owe nothing. Otherwise send only $3, the small sum asked.

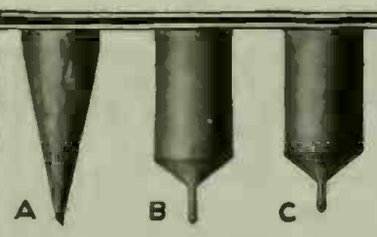
Some few doubters will scoff at the idea of will power being the fountain head of wealth, position and everything we are striving for, but the great mass of intelligent men and women will at least investigate for themselves by sending for the book at the publisher's risk. I am sure that any book that has done for me—and for thousands of others—what "Power of Will" has done—is well worth investigating. It is interesting to note that among the 250,000 owners of "Power of Will" are such prominent men as Supreme Court Justice Parker; Wu Ting Fang, Ex-U. S. Chinese Ambassador; Gov. McKelvie, of Nebraska; Assistant Posmaster-General Britt; General Manager Christeson, of Wells-Fargo Express Co.; E. St. Elmo Lewis; Senator Arthur Capper of Kansas and thousands of others. In fact, today "Power of Will" is just as important, and as necessary to a man's or woman's equipment for success, as a dictionary. To try to succeed without Power of Will is like trying to do business without a telephone.

As your first step in will training, I suggest immediate action in this matter before you. It is not even necessary to write a letter. Use the form below, if you prefer, addressing it to the Pelton Publishing Company, 30 K Wilcox Block, Meriden, Conn., and the book will come by return mail. You hold in your hand, this very minute, the beginning of a new era in your life. Over a million dollars has been paid for "Power of Will" by people who sent for it on free examination. Can you, in justice to yourself hesitate about sending in the coupon? Can you douht, blindly, when you can see, without a penny deposit, this wonder-book that will increase your will power in one hour.

The cost of paper, printing and binding has almost doubled during the past three years, in spite of which "Power of Will" has not been increased in price. The publisher feels that so great a work should he kept as low-priced as possible, but in view of the enormous increase in the cost of every manufacturing item, the present edition will be the last sold at the present price. The next edition will cost more. I urge you to send in the coupon now.

PELTON PUBLISHING COMPANY

30-K Wilcox Block. Meriden, Conn.



I will examine a copy of "Power of Will" at your risk. I agree to remit $3 or remail book in 5 days.

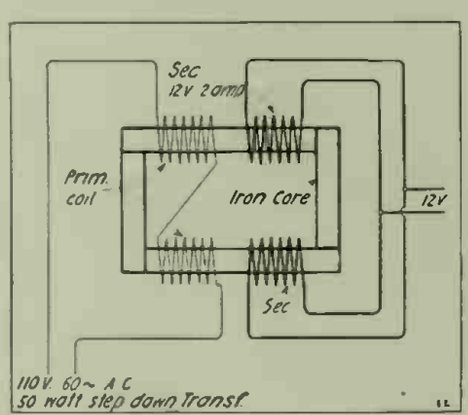
The Oracle

(*Continued from page* 146)

as the diagram shows. Those you show in your letter are not correct, for they give like polarity on each pole, which is wrong. We have no data on the starting coil dimensions, but you can arrive at this by experiment, or else by getting in touch with the manufacturers of a similar sized motor.

Proper Connection of Poles Composing Starting Winding of Induction Motor.



SPECIAL 110 VOLT TO 12 VOLT A. C. TRANSFORMER.

(1010) August Kling, Mobile, Ala., writes:

Q. 1. Asking for data on building a small step-down transformer to give 12 volts at the secondary, which he desires split into two coils. Total output 50 watts.

A. 1. We give herewith data on double wound closed core transformer to step-down 110 volts 60 cycle A. C. to a maximum secondary voltage of 12 volts.

The laminated sheet iron core for this transformer may measure 5 inches wide by 6 inches long, and have a cross-section of 1 inch by ½ inch. At either end of the two longer legs, as the diagram herewith shows, two primary windings may be placed, each of them consisting of 200 turns of No. 18 D. C. C. magnet wire. At either end of the two long legs, the two secondary windings may be placed, as the diagram shows, each of these developing about 12 volts and about 2 amperes, or giving 12 volts and 4 amperes or 50 watts, the total output you request for both secondaries connected in parallel. It is understood that both primaries in this design are to be connected in series on 110 volt 60 cycle A. C. at all times, i.e., whenever the transformer is used. The secondary windings each consist of 45 turns No. 12 B. & S. gage D. C. C. magnet wire, the secondary being wound on either leg beside the primary coil.

Details of 110-Volt to 12-Volt A. C. Transformer. Secondary Coils May Be Connected In Parallel or In Series.

With respect to taking off taps on the secondary for different voltages, you can easily divide up the total number of turns on the secondary yourself by means of a small battery voltmeter. You can readily test the potential by experiment. The voltage in any case is directly proportionate to the number of turns in use.

100-WATT, 32 TO 8-VOLT STEP-DOWN TRANSFORMER.

(1011) Claude Carefoot, Pasqua, Sask., Canada, inquires:

Q. 1. For data on step-down transformer to reduce 32 volts to 8 volts, A. C.

A. 1. We do not of course know how many watts you wish the transformer to carry, but we give you herewith data on a 100-watt transformer. The laminated sheet iron core may be about 8" long by 6" wide and thickness of 1". The core should have a cross-section of 1 square inch. The primary winding, on one leg of the transformer, should consist of 230 turns of No. 11 D.C.C. magnet wire.

The secondary winding should have 58 turns of No. 5 D.C.C. magnet wire.

My Inventions
By Nikola Tesla

(*Continued from page* 112)

any special thought of our far more imperative necessities. The "Magnifying Transmitter" was the product of labors extending through years, having for their chief object the solution of problems which are infinitely more important to mankind than mere industrial development.

If my memory serves me right, it was in November, 1890, that I performed a laboratory experiment which was one of the most extraordinary and spectacular ever recorded in the annals of science. In investigating the behaviour of high frequency currents I had satisfied myself that an electric field of sufficient intensity could be produced in a room to light up electrodeless vacuum tubes. Accordingly, a transformer was built to test the theory and the first trial proved a marvelous success. It is difficult to appreciate what those strange phenomena meant at that time. We crave for new sensations but soon become indifferent to them. The wonders of yesterday are today common occurrences. When my tubes were first publicly exhibited they were viewed with amazement impossible to describe. From all parts of the world I received urgent invitations and numerous honors and other flattering inducements were offered to me, which I declined.

In Faraday's Chair

But in 1892 the demands became irresistible and I went to London where I delivered a lecture before the Institution of Electrical Engineers. It had been my intention to leave immediately for Paris in compliance with a similar obligation, but Sir James Dewar insisted on my appearing before the Royal Institution. I was a man of firm resolve but succumbed easily to the forceful arguments of the great Scotchman. He pushed me into a chair and poured out half a glass of a wonderful brown fluid which sparkled in all sorts of iridescent colors and tasted like nectar. "Now," said he, "you are sitting in Faraday's chair and you are enjoying whiskey he used to drink." In both aspects it was an enviable experience. The next evening I gave a demonstration before that Institution, at the termination of which Lord Rayleigh addressed the audience and his generous words gave me the first start in these endeavors. I fled from London and later from Paris to escape favors

ELECTRICITY

Taught By A Practical Man

and In Your Home.

IT IS UP TO YOU.

I am teaching electricity and drafting to many men, young and old, and wish to interest you sufficiently so that you will send for my catalog which tells the whole story regarding my method of instruction and the good which is being accomplished. It is up to you whether you look into this proposition, but if you are in earnest in your desire to get into the electrical industry, or to become more proficient in that line, you will send for my catalog and not regret the time you give in doing so.

THE PURPOSE OF THE COURSE OF STUDY

I have been designing courses in electrical instruction and teaching electricity, off and on, during the past 17 years, and during that time I have had an unusual opportunity to make a special study of the teaching business, from the standpoint of a practical man. This course has been designed by me with a view of reaching those who do not have a lot of time and money to devote to study work and to give them as thorough a knowledge as possible of electricity as applied to every day practical work. The instruction is given like you were working on various jobs and I tell you what to do and how to do it, giving the necessary explanation for the understanding of the theory covered by the subject under discussion. Another particular feature of my instruction is that I lay particular stress on the unusual conditions which seldom happen in the every day run of electrical work, and this part of the instruction makes the course attractive and valuable to those already engaged in the electrical industry and accounts for the fact that over 60 per cent of my students are practical men.

FIFTY-FIFTY

I work absolutely on a 50-50 basis with my students and my method of handling their instruction and my dealings with them have never been criticised. You pay me the comparatively low price I ask and I give you the instruction and other help as stated in my catalog. No student is permitted to pay cash for his entire course on starting, the course being paid for in small monthly payments as you go along. Students have the privilege of discontinuing the work if they should find that it was not just what they were after and their payments stop at the same time. This is my way of doing business and a part of my 50-50 plan, as I would not want your money when I was not giving you the instruction.

Apparatus, Instruments, Materials, Etc.

Certain electrical apparatus, instruments, materials, charts, drafting materials, etc., as described in the catalog, are included as a part of the course for which there is no extra charge, as it is covered by the regular monthly payments.

BURGESS ELECTRICAL SCHOOL

745 E. 42d Street **Chicago, Ill.**

YORKE BURGESS,
BURGESS ELECTRICAL SCHOOL.
745 East 42nd Street, Chicago, Illinois.

Gentlemen:—
Send me catalog describing your course in Electricity and Drafting

NAME .....

ADDRESS .....

CITY .....

STATE .....

To Practical Men and Electrical Students:

(See review of this book by Editor in December issue of your Electrical Experimenter, page 568)

I have prepared a pocket-size note book especially for the practical man and those who are taking up the study of electricity. It contains drawings and diagrams of electrical machinery and connections, over two hundred formulas for calculations, and problems worked out showing how the formulas are used. This data is taken from my personal note book, which was made while on different kinds of work, and I am sure it will be found of value to anyone engaged in the electrical business.

The drawings of connections for electrical apparatus include Motor Starters and Starting Boxes, Overload and Underload Release Boxes, Reversible Types, Elevator Controllers, Tank Controllers, Starters for Printing Press Motors, Automatic Controllers, Variable Field Type, Controllers for Mine Locomotives, Street Car Controllers, Connections for reversing Switches, Motor and Dynamo Rules and Rules for Speed Regulation. Also, Connections for Induction Motors and Starters, Delta and Star Connections and Connections for Auto Transformers, and Transformers for Lighting and Power Purposes. The drawings also show all kinds of lighting circuits, including special controls where Three and Four Way Switches are used.

The work on Calculations consists of Simple Electrical Mathematics. Electrical Units, Electrical Connections, Calculating Unknown Resistances, Calculation of Current in Branches of Parallel Circuits, How to Figure Weight of Wire, Wire Gauge Rules, Ohm's Law, Watt's Law, Information regarding Wire used for Electrical Purposes, Wire Calculations, Wiring Calculations, Illumination Calculations, Shunt Instruments and How to Calculate Resistance of Shunts, Power Calculations, Efficiency Calculations, Measuring Unknown Resistances, Dynamo and Dynamo Troubles, Motors and Motor Troubles, and Calculating Size of Pulleys.

Also Alternating Current Calculations in finding Impedance, Reactance, Inductance, Frequency, Alternations, Speed of Alternators and Motors, Number of Poles in Alternators or Motors, Conductance, Susceptance, Admittance, Angle of Lag and Power Factor, and formulas for use with Line Transformers.

The book called the "Burgess Blue Book" is published and sold by the Burgess Engineering Company for one dollar ($1.00) per copy, postpaid. If you wish one of the books, send me your order with a dollar bill, check or money order. I know the value of the book and can guarantee its satisfaction to you by returning your money if you decide not to keep it after having had it for five days.

BOYS

Learn Drafting

Employers everywhere are looking for skilled draftsmen. They are offering good salaries to start with splendid chances for advancement.

Drafting offers exceptional opportunities to a young man because drafting itself not only commands good pay, but it is the first step toward success in Mechanical or Structural Engineering or Architecture. And drafting is just the kind of work a boy likes to do. There is an easy delightful way in which you can learn right at home in spare time. For 27 years the International Correspondence Schools have been giving boys just the training they need for success in Drafting and more than 200 other subjects. Thousands of boys have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon, then mark and mail it. This doesn't obligate you in the least and will bring you information that may start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon now.

TEAR OUT HERE

How to Build an Efficient Medical Coil Set

(*Continued from page* 125)

The tin foil and paraffined paper condenser used with this coil for intensifying the current for shocking purposes, etc., may be composed of about forty sheets of tin foil measuring 3x4 inches, each foil leaf separated with a layer of paraffined paper. Alternate sheets are connected together to form a terminal, and the condenser is finally connected up with the switch, as shown in Fig. 1, so that it can be cut in or out of circuit as desired.

Wooden Cabinet.

The cabinet proper, housing the two dry cells and the medical coil with control switches, in the case of the writer was made of some ¼-inch pine obtained from some old boxes. To further explain, and after considerable experience in building apparatus of this and kindred sorts, experience dictates that it is best not to bother with any elaborate wooden outer cabinets, but to make it more rugged by housing the apparatus and coils in a small dress-suit case. The author purchased one of these for $2.00, which filled the bill perfectly, the case being made of fiber with a good lock and hasp, reinforced corners and leather handle. The case measured 14 inches long by 8¾ inches in width and 4¾ inches in depth. Before building the cabinet, therefore, and providing you intend to enclose the apparatus in a case of this kind, which may be purchased at any trunk and bag store, you should ascertain the dimensions of the case beforehand, so that the cabinet will fit into it properly. As becomes apparent from Fig. 3, the top of the cabinet is the only part that shows when the case is open, and therefore it will be evident that the bottom can be made of pine and given a coat of black shellac or black coach varnish. The battery cover in the author's instrument is made of polished mahogany, being one-half of a mahogany base which originally belonged to an obsolete wireless instrument and a strip of polished mahogany was used for the central upright alongside the induction coil. The main switch panel which supports the coil of the condenser switch and the twelve points, also the secondary switch, is best made of either black fiber, polished hard rubber or bakelite. As the switch contacts are quite close together, and potentials of several hundred volts are carried thru adjacent contacts.

The battery compartment cover is held in place by means of four eye hooks, which can be purchased for a few cents at any hardware store, and as the experimenter has never yet been born, to the writer's mind, who has not wanted to use the battery which he has just locked up in a cabinet, provision is made so that the battery in this cabinet can be used at any time without having to open the compartment. For this purpose two auxiliary battery terminals or binding posts are placed on the side of the battery switch as Figs. 1 and 2 show.

Miscellaneous.

All of the connections under the panel supporting the apparatus as well as the battery connections are best made with rubber-covered flexible conductor about No. 18 B. & S. gage capacity. At Fig. 6 there are shown details for making the two metal handles, as well as a sponge electrode for treatment with saline solutions (salt water). The handles, if they are to be made instead of purchased, are very well composed of two lengths of brass tubing of about ¾-inch outside diameter by 3½ inches long. Each of these handles should be plugged up by a thick brass washer or a piece of ⅜ brass turned to make a driving fit in the tube, and which may be afterward sweated with solder so as to make a smooth tight joint which cannot be noticed, especially when the handles are afterward nickel plated. Thru the center of the plug a No. 8-32 tap hole should be drilled and threaded, into which a binding post may be secured or else a wooden handle as shown in the detail sketch, Fig. 6, may be utilized. This handle is turned up from some hard wood and given a coat of black shellac, and in the smaller end of the handle there is tightly fitted a piece of No. 8-32 screw. A small hole may be drilled crosswise thru the screw near the wood thru which the cord tip may be placed to make connection when it is used.

This wooden handle is very essential when the sponge electrode is employed, when it is screwed into the threaded shoulder in this electrode. To make the sponge electrode you will require a small piece of soft sponge about ½ inch thick which is sewed or laced with some heavy thread to the brass disc shown at Fig. 6. When using this electrode it is dipt into a salt water solution and applied over the part affected, such as a stiff muscle or cord, the patient holding the other handle in the hand, etc. The positive and negative poles of a faradic current as delivered at the binding post terminals, H and H¹, is readily determined by means of a polarity indicator, and the writer has successfully used very often one of the pole test paper indicators available on the market. This paper is dampened when it is to be used for determining polarity. Some of the papers turn red at the negative pole, and others turn red at the positive pole.

Paris Letter

(*Continued from page* 119)

tributed and is interrupted in a certain rhythmic manner, which thus gives alternating periods of rest and work to the actuated muscles. The application of the current is made by large metallic surfaces, the electrodes covering the entire muscular region under treatment. The method of application of these electrodes is carefully supervised by the physician in order to get the best results. The large surface electrodes overcome to a great extent the high resistance of the skin, and also renders it certain that the patient does not experience any disagreeable sensation.

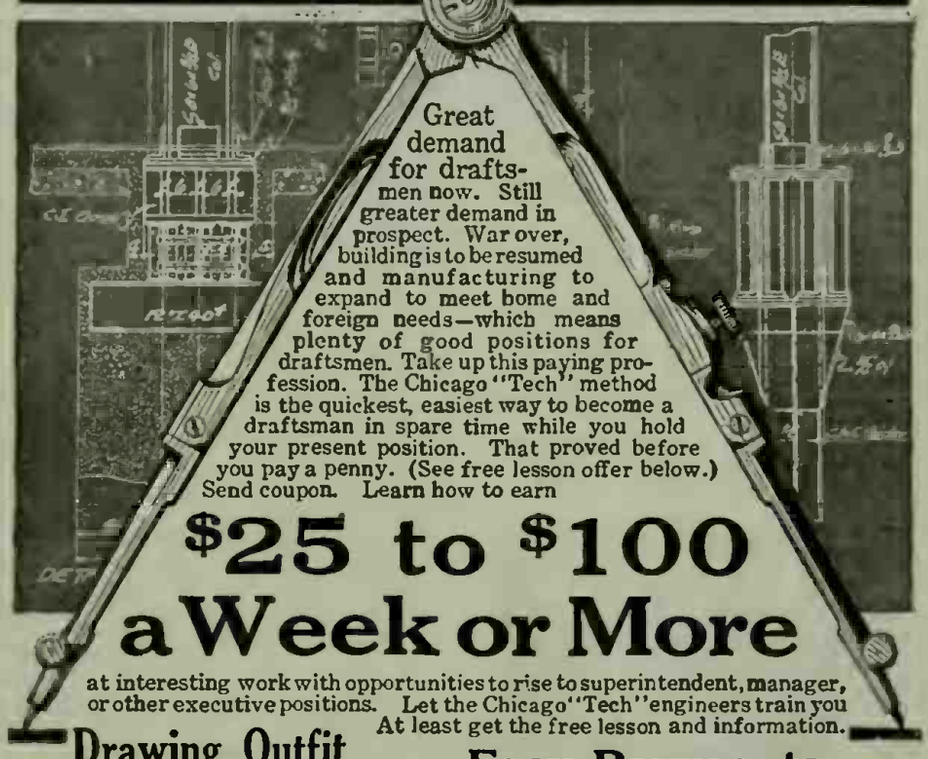
There is no nervous fatigue. The patient himself is unconscious of this gymnastic, passive *ergotheropy;* he experiences no shocks nor any disagreeable twitching. There is no muscular fatigue; the muscles are strengthened immediately; particularly the abdominal muscles are greatly benefited. The local circulation is highly stimulated. The motor functions of the muscles rapidly emerge from their impotency.

Our photographs were taken at the Grand-Lebrun Hospital at Bordeaux, Prof. Bergonié himself being in charge of the same. One of the photographs shows one of the electro-therapeutic wards while the faradization is taking place. It is interesting to watch the patients while they undergo the treatment. They seem to be unconscious of the effect of the current, but their muscles are working overtime. Our *Poilus* continue reading their newspapers and magazines as if they were actually enjoying a pleasant rest. The treatment extends for two hours in the morning and two in the evening, but in some cases the treatment is decreased or increased as becomes necessary, all depending on the specific cases. In one of our photographs we see a *poilu,* suffering from a fracture of the leg bones and the loss of his calve muscles, who was enabled to walk again without difficulty within fifteen days.

EXPERIMENTS IN RADIO ACTIVITY.

(*Continued from page* 123)

an undisputed footing to the atomic theory and has helped to solve many problems which have been puzzling the scientists for years.



Of course this series is only a beginning and the experimenter wishing to continue should procure a standard work on the subject such as Rutherford's justly famous "Radio-active Substances and Their Radiations." It is hoped by the author that these articles have begot an interest in this far-reaching and fascinating study.

(*Conclusion*)

WIRELESS SIGNALS HEARD THREE-QUARTERS OF A MILE.

As considerable discussion is often heard among radio men, both Professional and Amateur, as to the distance over which an amplified radio signal has been heard, it may be of interest to mention in this connection that Dr. Louis W. Austin of the U. S. Naval Radio-Telegraphic Laboratory states in a recent letter to the Editors that he has often heard incoming radio signals amplified by means of *standard* radio apparatus so as to be audible for from *½ to ¾ mile!* He also states that he believes it possible to amplify phonograph music or speech thru the aid of a standard audion amplifier having several stages and loud talking attachment, so that the music could be heard over a distance of a mile or more.

Make a Bigger Income
Learn Draftsmanship

Great demand for draftsmen now. Still greater demand in prospect. War over, building is to be resumed and manufacturing to expand to meet home and foreign needs—which means plenty of good positions for draftsmen. Take up this paying profession. The Chicago "Tech" method is the quickest, easiest way to become a draftsman in spare time while you hold your present position. That proved before you pay a penny. (See free lesson offer below.) Send coupon. Learn how to earn

$25 to $100 a Week or More

at interesting work with opportunities to rise to superintendent, manager, or other executive positions. Let the Chicago "Tech" engineers train you At least get the free lesson and information.

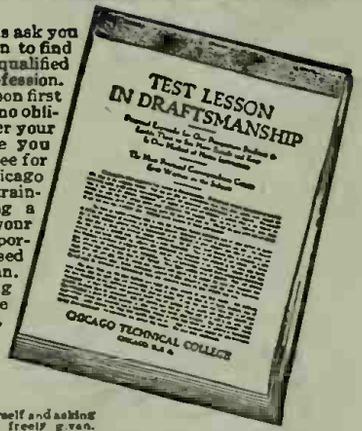
Drawing Outfit

(*No Extra Charge*)

Every student of the Chicago "Tech" Home Study Course in Draftsmanship receives this drawing outfit—set of instruments in case, drawing board, T square, triangles, scale, curve, drawing paper, pencils, etc., or a cash credit in case he already has an outfit. You use them while learning.—then take them right into your practical work.

NOTE: Enrolled with Chicago "Tech" you have the personal direction of practical engineers, builders and architects who teach you the methods they use in their own work. No useless theories, no time wasted. You are prepared to stand beside old, experienced men. Big advantage to learn from a staff like this—every man a specialist.

Come To the College or TRAIN at HOME



Wherever you are you can have this Chicago "Tech" training. Complete instruction by mail. Exercises, lessons, personal direction of our experts right in your own home if you cannot come to the college for a resident course. Send the coupon and get the facts.

Easy Payments

The fees for Chicago "Tech" courses are very moderate—and you can pay on easy terms. And also—you can obtain in a few months what it would take several years to acquire by ordinary methods. You can get an early start. You are soon ready to take a paying position and to quickly get back the cost of your course.

FREE TEST LESSON

Other institutions ask you to pay first—and then to find out later how well qualified you are for this profession. We send the free lesson first and place you under no obligation at all. Discover your qualifications before you pay anything. And see for yourself just what Chicago "Tech" offers you in training which will bring a ready market for your services and open opportunities which are closed to the untrained man. The coupon will bring all the facts about the course, the small fee, and the easy terms.

What's in a Cover?

WHAT we really should say is, "What's ON a cover?"—but you *did* get the meaning after all. There are covers and covers, or to qualify it better, let us say cover illustrations. Tons of reams could be written about them and still the correct answer as to what constitutes a *good* cover would be as nebulous to you as it is to every other magazine editor. To be sure, the "pretty girl" cover has been proven *the* real seller, but so has the homely baby face, and the ugly bulldog, not to speak of Charlie Chaplin or the playful kitten cover. All of these make good covers and the public buys millions of copies of publications every day on account of them.

But the subject on the cover alone does not always mean that it will prove a big seller. Like as not the color scheme plays just as big a rôle. For if the color is not pleasing, the magazine often does not sell, even if the pretty girl *does* adorn its front. Then there is the "teaser," the "wonder-what-it-is" cover. If gotten up correctly, and if it stirs up sufficient curiosity in a man's breast—every copy will be sold as a rule. For after all, man is curiosity incarnate, and is willing to pay for appeasing it!

Our April cover was of this sort, as indeed it was an all-around ideal type. It had the mysterious element in it; it was startling, and the color combination was right and pleasing.

Some one—an authority on magazines—said that if we did get out a thousand covers, we could never hope to beat the April cover! And if the sales of the April issue is an index, his prophecy probably will come true! Indeed, we had to print an extra edition, and that did not cover the demand.

Of course, adverse criticism was not lacking. A few cranks—the usual monthly crop—were on deck, loudly denouncing us. Their virtuous ego had been shocked profoundly because we dared to show a woman unattired, save for her—skeleton!! These "critics" like as not forget that "to the pure everything is pure." They belong to that fanatic category of men who can't bear to look at the naked truth, because it is—naked!

So we were pleasantly surprised when hundreds of readers from all sections of the country began sending us clippings of the editorial which accompanies this article.

This editorial was written by Arthur Brisbane, the highest paid editorial writer in the world. It was publisht in the New York *Evening Journal*, the Chicago *American*, the Washington *Times*, the Boston *American*, the Atlanta *Georgian*, the San Francisco *Examiner*, and the Los Angeles *Examiner*.

Mr. Brisbane seldom uses illustrations in his editorials. That he picked out our April cover illustration proves that it must have been good. Indeed, we may paraphrase Mr. Brisbane's editorial by asking:

"What is a Cover Illustration? A Backbone." And again:

"While there are many *magazines*, so few of them are vertebrate that you can count them on the fingers of your two hands in the United States."

Ask yourself or your friend, "What *magazine* do you know that you can call a vertebrate? What *magazine covers* have you ever heard anybody discuss?" See how many answers you get.

Today the ELECTRICAL EXPERIMENTER is the most widely quoted scientific publication in this country. Within its covers you will find the last word on Radio, Electricity, Aeronautics, Chemistry, Astronomy, Mechanics and all the allied sciences, written so that the layman as well as the most modern theorist may enlarge his fund of knowledge. Therefore do you wonder that hardly a newspaper worth the name fails to quote the EXPERIMENTER several times a month?

What do *you* think is the reason?

EDITORIAL PAGE OF THE NEW YORK
EVENING JOURNAL

What Is an Editorial?
A Backbone.

Here, reproduced from that interesting scientific journal The Electrical Experimenter, is a picture showing a lady's skeleton photographed by modern methods. You will see the resemblance between these bones and the editorial

On your knees thank kind Providence that we have not X ray eyes, but eyes that see the surface, nothing below.

If like the mysterious penetrating rays we could see THROUGH see the bones, the crinkly skull, with its interesting seams, and all the rest, how gruesome we should look to each other.

Marriages would all be made in heaven, none of them on earth. We should all look too ugly.

But wise Providence limits us to a million directions, giving us what we need to make us useful and efficient here and nothing unnecessary.

We cannot see colors below the red or above the violet. Insects probably see others. We cannot detect sound except within a narrow range. We see the bloom on the cheek, not the bone inside of it. We see the pretty graveyard with the green grass and the flowers, but do not know what happened to the individual who went in there.

We see the baby, just arrived, chewing its fist in the cradle, but don't know whence it came, what it was doing before it got here.

And it is all for the best.

This is written to answer a reader who asks, "What part should you say that the editorial plays in a newspaper?"

This little picture answers the question.

The editorial in a newspaper, if it IS an editorial, which it usually ISN'T, plays in that newspaper the part that the skeleton, and particularly the backbone, plays in the anatomy and the activity of the young lady in this picture.

She doesn't show it, her young man doesn't know it, the world at large doesn't know it, but the most important thing about her, that which makes her stand up and go through life well balanced on her two feet, is the bony structure, and particularly that BACKBONE.

The young man who doesn't know it really admires her for the backbone, admires her because she is a vertebrate, that is to say, one having a spinal column.

Without it she would lie flat on the ground, could not stand up could not walk, could not even crawl along. Beautiful hair and eyes and color would all go for nothing without the backbone.

So, inquiring reader, it is with the newspaper and the editorial column. The editorial column is the spinal column.

If the newspaper has got it, it is a vertebrate. If it hasn't got it—and newspapers usually haven't—it is a mollusk. The mollusk is good to eat, leads a prosperous, cheerful life quite often. But it is a mollusk.

In the newspaper, as in the human being, the backbone, or editorial column, makes the thing stand up and walk and gives it its power.

In this charming young person, as you can see at a glance, the skeleton is by far the least attractive part. It cannot be compared with long, curly hair, pink cheeks, red lips, sparkling eyes. But it is more necessary than those.

The newspaper's backbone, when it happens to be a newspaper with a backbone, is perhaps the least attractive part, the least pleasing. It does not compare with the woman's page, the continued story, the fashion page, the comic page, but it is THE BACKBONE.

While there are many newspapers, so few of them are vertebrates that you can count them on the fingers of your two hands in the United States.

Ask yourself or your friend, "What newspaper do you know that you can call a vertebrate? What newspaper editorial columns have you ever heard anybody discuss?" See how many answers you get.

Making a Practical Electrician

(*Continued from page 117*)

The new student starts at the very beginning, under an instructor that not alone initiates him into the electrical field, but helps to mold the character and general business policy of the future electrician.

In this school no text-books are in evidence! What the student hears and sees, as well as does, is first given to him verbally by his instructor. When he has done the work with his own hands, and made such notes as will be of assistance in the future to refresh his memory, the knowledge he has gained is the only text-book he uses. In the large electrical library of the school the student may at any time refer to any topics that seem hazy or not quite clear to him.

The new man learns the elementaries first, such as the meanings of various symbols and the rudimentary rules applying to electrical calculations, after which he does the practical work at his own table. Next he performs the simple feats of connecting up bells, batteries, telephones, fire-alarms, telegraphs and all sorts of intercommunicating systems.

From here he graduates into the high branch of applied electricity and in a practise building consisting of a ten room apartment he learns how to wire for light, heat and power by all the prevailing systems, such as cleat work, wood and metal moulding, knob and tube work, armored cable, flexible and metallic conduit.

As electrical power is one of the greatest factors of American industry, and its applications many, the electrician finds a great field in his endeavors in this one branch alone. Therefore, at this school every modern power problem is studied minutely. When this part of his course is finished the student is ready to tackle anything that may come his way, be it the installing or building of switchboards to carry enormous currents, the connecting and operating of alternating and direct current motors, dynamos or generators, or the operation or installation of storage battery systems as applied to electrical vehicle propulsion, and every other phase of this branch of electrical science. With his vast storehouse of knowledge gained by actual experience the student is well qualified to enter the field of Electric Traction, the coming achievement of this century, for he will have worked on, installed and run a complete electric trolley and locomotive.

Finally the student learns the biggest bug-a-boo of all, "Armature Winding," which to most people is a science in a class by itself. At this school a complete knowledge is quickly gained in a simple and practical manner. All puzzling details are rapidly grasped and within a short time the student is winding any form of armature, stator, field or motor ever used in actual practise. This and machine shop practise, repairs, electrical drafting, etc., complete the training course.

No specified time is set for a student to complete his studies—everything depends on the individual and the rate at which he can grasp things. No entrance "exams" are needed, one can start at any time. The men hold meetings, at which all new advances in science are discust and many novel features introduced.

When finally graduated the student, diploma in hand, stands ready to meet any phase of the electrical industry. He is able to undertake any job, for he has the confidence that only comes with the knowledge that he has done with his own hands the things he will have to do in actual practise in the business world. *Photos Courtesy N. Y. Electrical School.*

Learn to Fill Bigger Shoes

NO matter what kind of work you are doing now, a set of these great home study books will quickly fit you for a bigger and better paying job. We will send any set you select for one week's FREE examination, and if you want to keep them you pay only the special reduced price—at the rate of 50 cents a week. This is your opportunity to make more money—grasp it NOW. Use these books and a little spare time and LEARN TO FILL BIGGER SHOES.

Carpentry and Contracting
Five volumes, 2138 pages and more than 400 illustrations. Prepares for Contractor, Building Superintendent and Carpenter Foreman. Regular price, $25.00. Special price, $17.80.

Civil Engineering
Nine volumes, 8900 pages and 3000 illustrations, plates and diagrams. Prepares for Civil or Structural Engineer, Transitman, Estimator, Designer or Chief Draftsman. Regular price, $45.00. Special price, $29.80.

Telephony and Telegraphy
Four volumes, 1728 pages and 2000 illustrations, plates and diagrams. Prepares for Telephone Engineer, Wire Chief, Exchange Manager, Trouble Man or Telegrapher. Regular price, $20.00. Special price, $12.80.

Steam and Gas Engineering
Seven volumes, 3300 pages and 2500 illustrations, plates, diagrams, etc. Prepares for Stationary, Marine or Locomotive Engineer or Fireman. Regular price, $35.00. Special price, $21.80.

Law and Practice
(with Reading Course in 25 bound pamphlets). Thirteen volumes, 6000 pages and 24 illustrations. Prepares for all Bar Examinations. A wonderful aid to business men. Regular price, $72.00. Special price, $39.80.

Practical Accounting
Four volumes, 1840 pages and 800 illustrations, plates and diagrams, C. P. A. questions and practical problems. Prepares for Accountant, Bookkeeper or Cost Clerk. Regular price, $20.00. Special price, $12.80.

Pay Raisers

These books are written by well known authorities—the top-notchers in each line. They will help you make more money. You can't fail to understand them, because they are written in plain, everyday language. Thousands of photographs, diagrams, charts, etc., help to make difficult points as simple as A-B-C.

See our Free Examination—no money down offer below

Ask Our Experts

With these books goes free of all charge a $12.00 Consulting Membership in the American Technical Society. If any question puzzles you—write us. Our corps of experts and engineers will solve any problem. Ask all the questions you want for a whole year. This service is absolutely FREE.

Automobile Engineering
Five volumes, 2400 pages and 2000 illustrations. Prepares for Garage Foreman, Automobile Mechanic or Chauffeur. Invaluable to car owners. Regular price, $25.00. Special price, $17.80.

Machine Shop Practice
Six volumes, 2300 pages and 2500 illustrations. Prepares for Machine Shop Superintendent or Foreman, Foundryman, Pattern Maker, Tool Designer or Tool Maker. Regular price, $30.00. Special price. $19.80.

Sanitary, Heating and Ventilating Engin'ring
Four volumes, 1464 pages and more than 1400 illustrations, etc. Prepares for Sanitary Engineer, Heating and Ventilating Engineer, Master Plumber or Plumber. Regular price, $20.00. Special price, $13.80.

Mechanical and Architectural Drawing
Four volumes, 1678 pages and more than one thousand illustrations. Prepares for Architectural or Mechanical Draftsman. Regular price, $20.00. Special price, only $12.80.

Electrical Engineering
Seven volumes, 8000 pages and 2600 illustrations, plates and diagrams. Prepares for Electrical Engineer, Power Plant Superintendent, Substation Operator or Electrician. Regular price, $36.00. Special price, $19.80.

Accountancy and Business Management
Ten volumes, 3630 pages and 1987 illustrations, forms, etc. Prepares for Certified Public Accountant, Auditor, Office Manager, Accountant, Credit Man or Bookkeeper. Regular price, $50.00. Special price, $24.80.

Don't Send Any Money!

Write the name of the books you want on the coupon and mail it today. We will send the books at once, express collect, and you can use them just as if they were your own for a whole week. If you decide you don't want to keep them, send them back at our expense. If you like the books, as thousands of other men have after examination, just send us $2.00. You can send the balance of the special reduced price the same way—$2.00 each month (50 cents a week).

Start right now and learn to fill bigger shoes. There will be a better job looking for you if you do. Be ready to meet it when it comes. *Send the coupon now.*

American Technical Society, Dept. X338A, Chicago, Ill.

American Technical Society, Dept. X338A, Chicago, Illinois

Please send me set of _____ for 7 days' examination, shipping charges collect. I will examine the books thoroughly and, if satisfied, will send $2 within 7 days and $2 each month until I have paid the special price of _____. If I decide not to keep the books, I will return them by express at your expense. Title not to pass to me until the set is fully paid for.

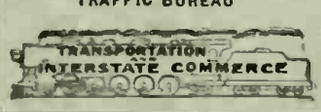
Be a Traffic Man-Earn $50 to $150 Weekly

Learn Professional Traffic Management

Unusual Opportunities await trained men in this field. Business institutions everywhere are forced to seek the services of competent Traffic Men. Constantly changing conditions require trained men to understand and solve the problems that arise. Big salaries are paid to men who can overcome these difficulties. YOU can fit yourself to do this pleasant work and command a salary from $3500 to $10,000 yearly.

TRAFFIC MANAGER

Pleasant Work—Easy to Learn



Spare time study—a few hours each week—will soon fit you to fill such a position. The work is easy, the surroundings pleasant and you become a man among big, successful men, with a private office, prestige,—and SUCCESS! Positions are permanent and lead to bigger opportunities constantly.

R. R. TRAFFIC MEN

TRAFFIC BUREAU

Your Success Depends On YOU!

Mere wishing and hoping will not bring results. You must GET ACTION if you would climb. The difference between "wages" and "salary" is in being able to do something the crowd can't do. Success is a matter of preparation.—It doesn't "just happen". The man willing to pay the price of preparation gets the big salary. Get out of the rut! Don't drift. Be a winner, not a wisher—and loser. Give yourself a chance. Only one thing can stop you—that's YOU. A pleasant job at a big salary awaits you as a trained Traffic Man. Our free booklet "Traffic" gives full particulars,—tells HOW you can "learn to earn the big salaries". The first step is to start—NOW! Prove your ambition. Take a step for SUCCESS. Write TODAY!

Our Courses Highly Practical

Entire course of instruction given by practical, experienced, successful traffic men. Their counsel and advice comes from their daily experience. They know the needs and requirements and they know the methods and information necessary to meet them, hence are amply fitted to successfully teach others. Each student gets personal attention. Practical assistance rendered for two years after graduation. An ordinary education, ambition and determination are all you need to win. An established Traffic Department at School furnishes practical experience, also offers opportunity for

Post Graduate Course Free

Students and graduates are privileged to use this feature without extra charge. Gives actual experience in rates, routing, classifications and packing. An exclusive feature not offered elsewhere.

TRAFFIC MANAGERS' salaries range from $3000 to $25,000 yearly.
TRAFFIC BUREAUS earn from $2000 to $10,000 yearly.
TRAFFIC SECRETARIES in Chambers of Commerce earn from $2500 to $10,000 yearly.

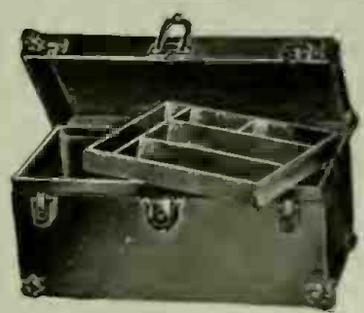
Interstate Traffic School, 266 Traffic Building, Ft. Wayne, Ind.

YOU HAVE A BEAUTIFUL FACE

BUT YOUR NOSE?

BEFORE

AFTER



IN THIS DAY AND AGE attention to your appearance is an absolute necessity if you expect to make the most out of life. Not only should you wish to appear as attractive as possible, for your own self-satisfaction, which is alone well worth your efforts, but you will find the world in general judging you greatly, if not wholly, by your "looks," therefore it pays to "look your best" at all times.

Permit no one to see you looking otherwise; it will injure your welfare! Upon the impression you constantly make rests the failure or success of your life. Which is to be your ultimate destiny? My new *Nose-Shaper*, "TRADOS" (Model 24) corrects now ill-shaped noses without operation, quickly, safely and permanently. Is pleasant and does not interfere with one's daily occupation, being worn at night.

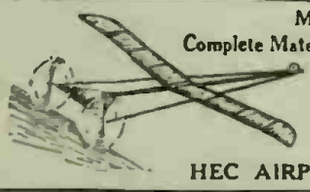
Write today for free booklet, which tells you how to correct ill-shaped noses without cost if not satisfactory

M. TRILETY, Face Specialist **1162 Ackerman Bldg., Binghamton, N. Y.**

This is the handiest and most useful Tool Kit to have around the house or Garage.

Fisher's Metal Tool Kits

For Electricians, Wiremen, Plumbers, Tinners, Motorists, Mechanics and Garage Men.



Only the very best of workmanship is used in the construction of all our Tool Kits. Neat in appearance, light in weight, and handy to carry—Dust, Dirt and Water-proof.

The corners, sides and ends are doubly reinforced, giving them the required strength and durability to withstand Knocks, Bumps, and rough usage that the average kit is subject to. The Hinges, Handle, Lock and Catches are all metal, and are of the most substantial and best quality that can be obtained.

The tray is intended to hold small tools, such as Pliers, Drill Bits, Screw Drivers, Chisels, etc.

SPECIAL OFFER: In order to introduce our Tool Kits more thoroughly we will ship your choice of any one of the following sizes, complete with tray, remittance to accompany the order, for $4.25—No. 30, size 18x8x8. No. 32, size 19x9x9. No. 34, size 20x10x10. If a larger or smaller size than the above, or a different style Tray is desired, write for information and prices or send for Booklet. Agents and Dealers wanted in every locality. Address all orders and make all remittances payable to

(Continued from page 122)

decay may be at all noticeable.

COOKING OF EGGS. There is a notion prevalent that hard-boiled eggs are not digestible, and experiments made with eggs in the stomach lead to the same conclusion. Thus eggs slightly boiled have left the stomach in 1¾ hours, and raw in 2¼ hours, and hard-boiled in 3 hours. It should be noted, however, that raw eggs are only partially digested in the stomach, perhaps because they do not fully excite the flow of the gastric juice. The complete digestion is accomplished further along in the alimentary canal.

In cooking eggs, they should be placed in water at 170 to 180 degrees Fahrenheit, and allowed to remain for 10 minutes, when the yolk will be found to be more coagulated than the white, the egg albumin beginning to coagulate at 134 deg. Fahr., and it requires some time to heat the egg thruout.

A convenient method for cooking eggs without the use of a thermometer is to pour a quart or so of boiling water into a bowl, and put two or three eggs into this and allow them to remain for 10 or 12 minutes. The yolk actually cooks more readily than the white, and by this process the eggs are cooked uniformly thruout.

QUESTIONS AND ANSWERS

MIXING MILK AND ACID.

Ques. No. 5. A. J. Karlson, Phenix, Ariz., wants to know if it is possible after milk or cream is mixt with Sulfuric acid, to remove the latter and restore the acid to the same strength as before.

Ans. We do not quite understand your object in mixing the acid with the milk, only to revert back to the same original substances. However, this is not possible, as the acid enters into reaction with the formation of new compounds, which reaction is not reversible.

FIRE EXTINGUISHER.

Ques. No. 6. *Fire Extinguishers.* Mr. Kenneth Gordon, Tulsa, Okla., desires information regarding ingredients and operation of fire extinguishers.

Section Thru a Standard Fire Extinguisher.

Answer: A solution of sodium bicarbonat is contained in a metallic cylinder, having a flexible tube at one of the upper sides. Sulfuric acid is kept in a small container above the bicarbonat as shown in the accompanying illustration. When the extinguisher is inverted, the stopper falls out of the bottle, permitting the sulfuric acid to come in contact with the solution of sodium bicarbonat, with the formation of carbon dioxid, thus:—

$$H_2SO_4 + 2NaHCO_3 = 2H_2O + Na_2SO_4$$

The presence of the carbon dioxid gen-

www.americanradiohistory.com

erated forces the solution out thru the hose.

"Pyrene" extinguishers contain carbon tetrachlorid, a highly volatile liquid, whose vapor does not burn.

In either case the gases liberated so envelop the flame that combustion ceases, due to lack of its supporter, oxygen.

RADIOACTIVE GAS MANTLE.

Question 7. *Welsbach Mantle.* Theodore McGowan, Elmira, New York, wants to know how he can conclusively show that the Welsbach gas mantle contains radioactive substances.

Answer: The most simple and conclusive method is to place a gas mantle upon a box which contains an unexposed photographic plate, wrapt in the usual opaque paper. Set these aside for a week or ten days, and develop as usual. The result will be a photographic reproduction of the mantle, exposed by its own light, liberated by the radioactive ingredients.

FULLER'S EARTH.

Question 8. William W. Staley, Portland, Oregon, desires information as follows: Where he can obtain Fuller's earth as mentioned in the April issue, Experiment No. 3 on Butter Tests; and also the composition of the alcoholic potash solution as mentioned in Experiment No. 4 in the same issue.

Answer: (a) *Fuller's Earth* may be obtained from any chemical supply house dealing in chemicals, and may be ordered under that name.

(b) The *Alcoholic Potash Solution* mentioned is prepared by dissolving 28 grams of caustic potash (in stick form) in 1 litre of alcohol.

Science in Slang

(*Continued from page* 143)

tomers at the same time. At that, the automatic is some little system and the guy who invented it certainly had it thick behind the ears. All you have to do is to move a little disc around the front of the 'phone, having numbers from 1 to 0, and you don't have to wait for a connection, either. If the line is busy you hear the usual busy signal which means, Hang up your receiver.' After a while you try it again and you can cuss and howl all you want if it's still busy. The automatic 'phone exchange doesn't mind it in the least, and take it from me, the system works to a charm."

"That so?" interposed Punk Loomis. "When how comes it that if the system works so charmingly and charmfully, the rest of the universe doesn't adopt it?"

"You see," said Stokes, "it's like this: When a man bumps into you at the corner, almost upsetting you, it does your heart good to come back at him with a long string of verbosity that clears out your venom and makes you feel comfortable again. as soon as it is out of your system. But if you run into a lamp-post, it doesn't do you much good to cuss at it by letting loose a blue streak of hyphenated talk. Same with the automatic outfit. A man wants to have somebody to act as his personal goat once in a while. He wants to tell Central what is the matter with her. Or, if he is not inclined that way and time hangs heavily on his hands, he might want to speak to her about the color of her eyes or the texture of her soul. Never mind if she hangs up on him, that's the complexity of the human mind. So while the automatic is a fine outfit as far as it goes, it is too *inhuman*, for it refuses to be your goat and that is the reason——"

"Stokes!" yelled the steward. "Long distance is answering."

The Man Who *Wouldn't* Stay Down

He was putting in long hours at monotonous unskilled work. His small pay scarcely lasted from one week to the next. Pleasures were few and far between and he couldn't save a cent.

He was down—but he *wouldn't stay there!* He saw other men promoted, and he made up his mind that what they could do *he* could do. Then he found the *reason* they were promoted was because they had special training—an expert knowledge of some one line. So he made up his mind that *he* would get that kind of training.

He marked and mailed to Scranton a coupon like the one below. That was his first step upward. It brought him just the information he was looking for. He found he could get the training he needed right at home in the hours after supper. From that time on he spent part of his spare time studying.

The first reward was not long in coming—an increase in salary. Then came another. Then he was made Foreman. Now he is Superintendent with an income that means independence and all the comforts and pleasures that make life worth living.

It just shows what a man with ambition can do. And this man is only one out of hundreds of thousands who have climbed the same steps to success with the help of the International Correspondence Schools.

What about *you?*

Are you satisfied merely to hang on where you are or would you, too, like to have a real job and real money? It's entirely up to you. You don't *have* to stay down. You *can* climb to the position you want in the work you like best. Yes, you can! The I. C. S. are ready and anxious to come to you, wherever you are, with the very help you need.

Surely when you have an opportunity that means so much, you can't afford to let another priceless hour pass without at least finding out about it. And the way to do that is easy—without cost, without obligating yourself in any way, mark and mail this coupon.

TEAR OUT HERE

INTERNATIONAL CORRESPONDENCE SCHOOLS
Box 6189, SCRANTON, PA.

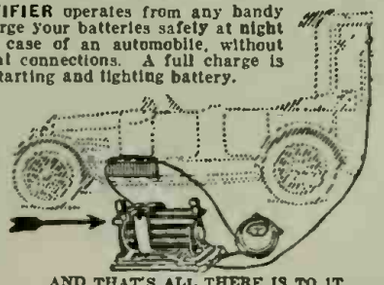
CHARGE YOUR OWN BATTERIES and they are READY WHEN YOU NEED THEM

The highly efficient Full-Wave F-F MAGNETIC RECTIFIER operates from any handy Alternating Current Lamp Socket and enables you to charge your batteries safely at night unattended right in your own home garage and in the case of an automobile, without removing the battery from car or breaking any electrical connections. A full charge is done over night and costs about 6 cents for the average starting and lighting battery.

For operation from Farm Lighting Plants or Direct Current Service you would use the F-F Charging Rheostat.



Either style of BATTERY BOOSTER is Portable and furnished complete with Ammeter and Battery Clips.

No electrical knowledge whatever is required to operate the F-F Charging Outfit. You simply screw plug in lamp socket and snap charging wires on battery terminals. That's all there is to it.

The F-F BATTERY BOOSTER means Long Life to your battery, a Hotter Spark, a Quicker Start, Brighter Lights, Vitality to carry overload and work overtime, and that it is READY WHEN YOU NEED IT.

For Perfect Health, Strength, Unlimited Vitality & Improved Personal Appearance

The STERLING HIGH FREQUENCY VIOLET RAY

CELEBRATED Physicians and leading Beauty Specialists receive fabulous fees for treating with the Violet Ray. *You* can have a health doctor and beauty specialist right in your own home for your daily service at an average cost of less than a penny stamp.

The Sterling High Frequency Violet Ray was specially designed for home use—fitted to work from the ordinary lamp socket—easy to manipulate—under control at all times—and contains within its covers the Services of a servant, a doctor of medicine, and a nerve and beauty specialist—all in one, ready for instant service.

The Sterling Violet Ray is invaluable in the treatment of diseases of the skin, mouth, throat and lungs, derangements of the liver, kidneys, stomach and intestines—soreness in muscles and joints—tired or "sick" brains or lack of "nerve tone." It strengthens heart action—cleanses the blood—brings the flush of youth to the skin—enlivens the hair—puts a "spring in your step" and creates a clear eye and brain.

Six hundred thousand vibrations per second saturate the entire body with electricity—fill the blood with oxygen—eliminate waste, toxins, and poisons—ALL enemies of youthfulness.

Sterling Violet Ray Generators are the creations of Mr. Anthony Longoria, our Chief Designing Engineer, whose long years of practical experience in the designing and operation of Violet Ray Generators entitle him to the commanding position he holds in their manufacture. They are based upon the original discoveries of Nikola Tesla, first given to the world in May, 1891, but have been developed to the highest state of perfection ever reached in this type of generators.

Book and Valuable Information Free

We want to send you our book and full particulars about the Sterling Violet Ray Machines. Read how you can treat innumerable diseases and ailments, improve your personal charm, add strength and vitality and help yourself in hundreds of ways. Just mail the coupon or drop a postal. Do it now, this minute, before you forget it.

The Moon's Rotation

By Nikola Tesla

(*Continued from page* 133)

significance of this will be understood by reference to Fig. 7 in which the two masses, condensed into points, are represented as attached to independent weightless strings of lengths R_{c1} and R_{c2} which are purposely shown as displaced but should be imagined as coincident. It will be readily seen that if both strings are cut in the same instant the masses will fly off in tangents to their circular orbits, the angular movement becoming rectilinear without any transformation of energy occurring. Let us now inquire what will happen if the two masses are rigidly joined, the connection being assumed imponderable. *Here we come to the real bug in the question under discussion.* Evidently, so long as the whirling motion continues, and both the masses have precisely the same angular velocity, this connecting link will be of no effect whatever, not the slightest turning effort about the common center of gravity of the masses or tendency of equalization of energy between them will exist. The moment the strings are broken and they are thrown off they will begin to rotate but, as pointed out before, this motion neither adds to or detracts from the energy stored. **The rotation is, however, not due to an exclusive virtue of angular motion, but to the fact that the tangential velocities of the masses or parts of the body thrown off are different.**

To make this clear and to investigate the effects produced, imagine two rifle barrels, as shown in Fig. 8, placed parallel to each other with their axes separated by a distance $R_{c1} - R_{c2}$ and assume that two balls of same diameter, each having mass m, are discharged with muzzle velocities V_1 and V_2, respectively equal to $2\pi n R_{c1}$ and $2\pi n R_{c2}$ as in the case just considered. If it be further supposed that at the instant of leaving the barrels the balls are joined by a rigid but weightless link they will rotate about their common center of gravity and in accordance with the statement in my previous article above mentioned, the relation will exist $\frac{V_1 - V_2}{2} = \pi n (R_{c1} - R_{c2})$ n being the number of revolutions per second. The equalization of the speeds and kinetic energies of the balls will be, under these circumstances, very rapid but in two heavenly bodies linked by gravitational attraction, the process might require ages. Now, this whirling movement is real and requires energy which, obviously, must be derived from that originally imparted and, consequently, must reduce the velocity of the balls in the direction of flight by an amount which can be easily calculated. At the moment of discharge the total kinetic energy was $E = \frac{1}{2} m V_1^2 + \frac{1}{2} m V_2^2$ which is evidently equal to $m V_3^2$, V_3 being the effective velocity of the common center of gravity, from which follows that $V_3 = \sqrt{\frac{V_1^2 + V_2^2}{2}}$. The speed of revolution of the masses is, of course, $\frac{V_1 - V_2}{2}$ and the rotational energy of both balls, which must be considered as points, is $e = m\left(\frac{V_1 - V_2}{2}\right)^2$ The kinetic energy of translation in the direction of flight is then $\frac{1}{2} m V_1^2 + \frac{1}{2} m V_2^2 - m\left(\frac{V_1 - V_2}{2}\right)^2 = m\left(\frac{V_1 + V_2}{2}\right)^2 = m V_3^2$, $V_3 = \frac{V_1 - V_2}{2}$ being the speed of the

common center of gravity, so that $V_1 - V_1$ is the loss of velocity in the direction of flight owing to the rotation of the two mass points. If instead of these we would deal with the balls as they are, their rotational energy

$$e_1 = e + i\omega_1^2 = m\left(\frac{V_1 + V}{2}\right)^2 + i(2\pi n)^2$$

i being the moment of inertia of each ball about its axis.

As will be seen, we arrive at precisely the same results whether the movement is rectilinear or in a circle. In both cases the total kinetic energy can be divided into two parts, respectively of the same numerical values, *but there is an essential difference.* In angular motion the axial rotation is nothing more than an *abstract conception;* in rectilinear movement it is a *positive event.*

Virtually all satellites rotate in like manner and the probability, that the acceleration or retardation of their axial motions—if they ever existed—should come to a stop precisely at a definite angular velocity, is infinitesimal while it is almost absolutely certain that all movement of this kind would ultimately cease. The most plausible view is that no true moon has ever rotated on its axis, for at the time of its birth there must have been some deformation and displacement of its center of gravity thru the attractive force of the mother planet so as to make its peculiar position in space, relative to the latter, in which it persists irrespective of distance, more or less stable. In explanation of this, suppose that one of the balls as M in Fig 5 is not of homogenous material and that it is similarly supported but on an axis passing thru its center of gravity instead of form. Then, no matter in what position the ball is fixed on the pivots, its kinetic energy and centrifugal pull will be the same. Nevertheless a directive tendency will exist as the two centers do not coincide and there is, consequently, no *dynamic* balance. When permitted to turn freely on the axis of gravity the body, of whatever shape it may be, will tend to place itself so that the line joining the two centers points to O and there may be two positions of stability but, generally, if the center of gravity is not greatly displaced, the heavier side will swing outwardly. Such condition may obtain in the moon if it had solidified before receding from the earth to great distance, when the

POPULAR ASTRONOMY

The Evolution of the Stars

(Continued from page 121)

Canopus, one of the giants of the universe. The transition of this type into the solar type stars of class G, to which our sun belongs, occurs when the group of iron lines known as group G begins to appear (see diagram I). The lines of calcium and hydrogen still remain more intense than any other lines in the spectrum, but many fine metallic lines now appear in ever-increasing intensity. The transition of this type into the advanced solar type K occurs when some of the metallic lines surpass the hydrogen lines in intensity. The group of iron lines has also greatly increased in intensity until it becomes one of the most conspicuous features of the K type stars. Stars of the solar type such as Capella and the sun are yellow, and stars of the advanced solar type, such as Arcturus and Aldebaran, are orange colored bordering on red. Their atmospheres are filled with dense metallic vapors. (See photos of solar and advanced solar type spectra.)

Class M is divided into giant and dwarf

SPECIAL KON-VER-TER SLIDE RULE

The Hamilton Improved circular slide rule has over 3000 graduations and over 1800 figures and letters on it, and is an engineers hand book and slide rule combined. It is 6.4 inches in diameter.

It will subtract, divide, multiply and add fractions or decimals of an inch can be used as a decimal equivalent table, constructed of three disks and double transparent celluloid rider. Decimal equivalents given to six places to figures, gives sines, co-sines tangents, co-tangents, secants, co-secants versed sines, co-versed sines, square, cube and fifth roots with all their powers. Finds the area, circumference and diameter of circles directly.

The Log scale has 1000 graduations. The DE LUXE rule may be bent double without injury, try this with rigid material such as metal. Has no clumsy operating attachments and will work proportions.

The KON-VER-TER is artistic as well as useful. In use all over the U.S., Canada, Mexico, Cuba, Porto Rico, Panama, Bermuda, Hawaii, Philippines, Australia and New Zealand. Instructions with rule.

Beautiful gold embossed black leatherette case, 50c extra. PLAIN UTILITY RULES $1.00. SPECIAL DELUXE RULES white ivory celluloid $2.50 P.P.

red stars with banded and fluted spectra corresponding to Secchi's type III. Their dense atmosphere are filled with metallic compounds and they are superficially at least much cooler than stars of the other types outlined above. (See spectrum of typical giant type M star.)

The Relative Positions of Certain Lines Prominent in Various Stellar Spectra Are Indicated in the Above Diagram of the Visible Spectrum: K and H Are the Absorption Bands of Calcium in the Extreme Violet End of the Spectrum. The Ultra-Violet Lies Beyond to the Left. Hδ, Hγ, F, and C Are the Characteristic Absorption Lines of Hydrogen Prominent in Type I and Type II Stars. g Is a Line of Calcium in the Violet. G Is a Group of Lines Due to Iron Prominent in Solar Type Stars. E Is a Second Group of Iron Lines. D Is a Pair of Lines in the Yellow Due to Sodium. A Is a Group of Lines in the Extreme Red Originating in Our Own Atmosphere.

Class N corresponds to Secchi's type IV and its characteristics have been mentioned above.

The position of the *Novae* or *Temporary Stars* in this scheme of evolution is somewhat uncertain, if in fact they fit into it at all. At the time of their outburst their spectra are usually rich in violet light and they are therefore to be classed with first type stars. Many sudden and peculiar changes take place in their spectra, but one characteristic is common to all novae, and that is the existence of both bright and dark bands of helium and hydrogen greatly displaced in position, the dark ones being shifted toward the violet and the bright ones toward the red.

Temporary stars usually pass first into bright line stars and later into planetary nebulae, thus reversing the generally accepted order of evolution from nebulas to bright line stars.

Tho a gradual transition from one type of star to the next can be traced, it does not necessarily follow that *all* stars pass from nebula to type M or type N stars thru all the types O, B, A, F, G and K in order and from there on to gradual extinction. It is possible that some stars become extinct or cease to shine without passing thru all of these stages.

The fact that in certain double star systems two stars physically connected and therefore evidently formed at the same time are at different stages of development calls for explanation. Some stars may run thru the course of evolution more rapidly than other stars, and some stars may lose their radiating powers before they have completed the normal course of evolution.

The marked division of the solar and late type stars into dwarf and giant stars also has a direct bearing on the problem of the order of the evolution of the stars. Tho the generally accepted order of evolution is that outlined above, it is possible that the sequence advanced by Prof. H. N. Russell may be the true one in which the evolution begins with giant stars of type M, continues in an order reverse to the one usually accepted thru giants of types K, G and F to the type B helium stars, hence in the normal order thru the *dwarfs* of types F, G, K and M to extinction. This would account for the existence of both giants and dwarfs of the later types. The Orion or Helium stars, which are the hottest of all the stars, would in this case represent the height of stellar development.

Whatever may prove to be the exact sequence in the evolution of the stars, the fact that there is evolution and change going on among the stars is indisputable. Such is the similarity existing among the hundreds of millions of stars of the universe that they can be grouped or classified under one or another of the few distinct types outlined above according to their color and the characteristic lines of their spectra.

(The next installment will appear in an early issue.)

TABLE SHOWING THE ORDER OF THE EVOLUTION OF THE STARS ACCORDING TO THE CLASSIFICATIONS OF SECCHI AND THE HARVARD COLLEGE OBSERVATORY

Type of Star		Typical 1st Mag. Star	Color	Characteristic Lines of Spectra
Secchi	Harvard			
.....	Gaseous Nebulae	.....	Green	Bright lines of helium hydrogen and nebulium.
.....	O (Wolf-Rayet)	....	Blue-White	Bright bands and lines of helium and hydrogen changing later to dark bands and lines.
.....	(Novae)	Nova Persei	....	Bright and dark bands, greatly displaced, of helium and hydrogen.
Type I	B (Helium)	Rigel	Blue-White	Dark absorption lines of helium and hydrogen, but chiefly of helium and a few faint metallic lines.
	A (Hydrogen)	Sirius	White	Intense absorption lines of hydrogen, reaching maximum. Increasing strength of metallic lines.
Type I-II	F (Calcium)	Canopus	White tinged with yellow	Intense bands and line "g" of calcium in violet. Hydrogen lines of great intensity; many strong metallic lines.
Type II	G (Solar)	Capella	Yellow	Increased intensity and number of metallic lines. Strong hydrogen lines still surpassing metallic lines in intensity. Appearance of Group G lines due to iron.
	K (Advanced Solar)	Arcturus	Orange	Decrease in strength of hydrogen lines. Great increase in number and strength of metallic lines and Group G of iron.
Type III	Ma (banded)	Betelgeuse	Red	Appearance of banded spectra due to compounds of titanium oxide.
	Mh (banded)	.....	.....	Marked faintness of violet end of spectrum.
Type IV	N (Carbon)	.....	Red	Banded spectra due to presence of carbon compounds.

NOTE—This latest type does not follow in order after Type M, but is entirely independent of it in its evolution.

The novae also do not fit into the regular chain of evolution, but are placed after the stars they most closely resemble.

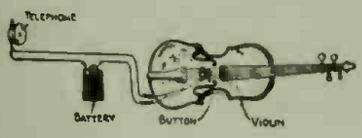
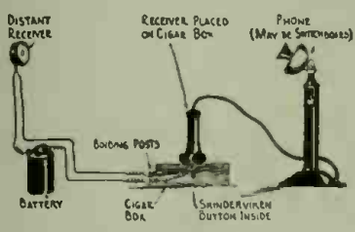
MOST SENSITIVE MICROPHONE

FOR $1.00



YOU can easily make a highly sensitive detectophone by using a Skinderviken Transmitter Button to collect the sound waves. You can build your own outfit without buying expensive exquipment. Think of the fun you would have with such an instrument! It's very simple, too, and inexpensive.

You can install an outfit in your home and hear the conversation being held all over the house. You can connect up different rooms of a hotel. *Our outfit was used by secret service operatives during the War. It is being used on the stage.*



AMONG electrical experimenters the button has created a sensation. It is not uncommon to receive unsolicited letters like these: "I received transmitter button today and I wish to inform you that it works great and is *the best I have ever seen or heard of for the price.* I will certainly recommend it to my friends. I wish to thank you for your good service."

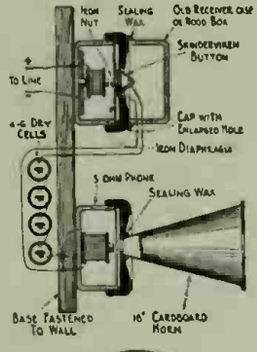
"I have been using one of your transmitter buttons, and it has proved to be worth more than its value in my experimenting." "I received one (Transmitter Button) some time ago, and they

So much for its commercial adaptations! *You* can procure apparatus of the same type.

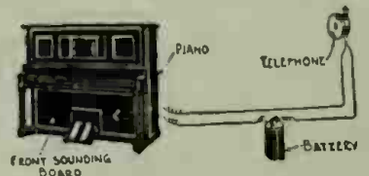
One of the main advantages of the Skinderviken Transmitter Button lies in its ultra-sensitiveness.

You can place it in any position you like. It is the greatest invention in micro-phones and has won recommendations from men of high standing in the scientific world. It is being used all over the world. You can mount it most anywhere. Card board boxes, stove pipes, stiff calendars and hundreds of other places will suggest themselves to you. The buttons cannot be seen by any one in the room as they are so small and light. Only a small brass nut is exposed to the view.

Full directions for connecting up the button for use as a detectophone are given in booklet No. 4 which is sent with each button.

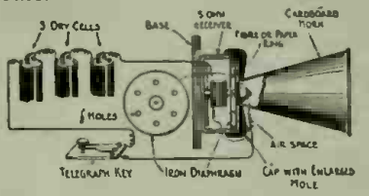


The only instruments needed to complete a detectophone outfit, in addition to a Skinderviken Transmitter Button are a receiver, battery, and, if desired, an induction coil.



REAL BARGAINS

These prices are very low



All equipment is GUARANTEED. The apparatus is the same as sold by us to large telepbone companies. 110 volt telephone generators.

are just O. K. for experimentary." "I have been using one of your transmitter buttons for experimental work and it certainly lives up to all you say for it *and then some.*"

Mr. H Gernsback, editor of tbis magazine, who is the dean of electrical experimenters, said: "In writer's opinion, obtained by actual elaborate tests, your Transmitter Button is probably most efficient device of its kind on market today, due to its simplicity and other outstanding features. Should have a great future."

The same circuit connections apply to all experiments, regardless of how the transmitter button is mounted.

The Skinderviken Transmitter Button operates on one or two dry cells. It often happens that two cells produce too much current and the sounds are deafening. We recommend either one fresh cell or two worn out cells.

We have the utmost faith in our transmitter button. We guarantee satisfactory service or we will refund the purchase price. Boys—Young and old—send in a dollar bill RIGHT NOW! You can't lose. If you're not satisfied, you receive your dollar back. Isn't that fair?

Send a 3c stamp for a copy of Booklet No. 4.

Mining Engineering

For Your Profession

A wide and profitable field, not overcrowded, is open to forward-looking young men. The Michigan College of Mines, established 1886, offers a comprehensive four year course which can be completed in three years. Its breadth provides foundation for expert specialization in that field of engineering which most appeals to the student. All phases of technical knowledge and instruction relative to mine development and operation thoroughly presented by constructive methods. Practical experience is there combined with theoretical work in a rare way. *College is located in center of one of the world's greatest copper mining districts.* Close relations are constantly maintained with mines, mills, smelters, electrolytic and power plants which are practically a part of the College equipment and a factor of enormous value in instruction. "M. C. M. Men Make Good." For descriptive book address Administrative officer, Houghton, Mich.

Established 1899. 906 D. S. of L. Bldg., DETROIT, MICH.

The Moon's Rotation

By Nikola Tesla

(Continued from page 157)

arrangement of the masses in its interior became subject to gravitational forces of its own, vastly greater than the terrestrial. It has been suggested that the planet is egg-shaped or ellipsoidal but the departure from spherical form must be inconsiderable. It may even be a perfect sphere with the centers of gravity and symmetry coinciding and still rotate as it does. Whatever be its origin and past history, the fact is, that at present all its parts have the same angular velocity as though it were rigidly connected with the earth. This state must endure forever unless forces from without the luna-terrestrial system bring about different conditions and thus the hope of the star-gazers that its other side may become visible some day must be indefinitely deferred.

A motion of this character, as I have shown, precludes the possibility of axial rotation. The easiest way to free ourselves of this illusion is to conceive the satellite subdivided into minute and entirely independent parts, as dust particles, which have different orbital, but rigorously the same angular, velocities. One must at once recognize that the kinetic energy of such an agglomeration is solely translational, there being absolutely no tendency to axial rotation. This makes it also perfectly clear why the moon, provided its distance does not greatly increase, *must* always turn the same face to us even *without any inherent directive tendency* nor so much as *the slightest effort from the earth.*

Referring to the librations of longitude, I do not see that they have any bearing on this question. In astronomical treatises the axial rotation of the moon is accepted as a material fact and it is thought that its angular velocity is constant while that of the orbital movement is not, this resulting in an apparent oscillation revealing more of its surface to our view. To a degree this may be true, but I hold that the mere change of orbital velocity, as will be evident from what has been stated before could not produce these phenomena, for no matter how fast or slow the gyration, the position of the body relative to the center of attraction remains the same. The real cause of these axial displacements is the changing distance of the moon from the earth owing to which the tangential components of velocity of its parts are varied. In *apogee*, when the planet recedes, the radial component of velocity decreases while the tangential increases but, as the decrement of the former is the same for all parts, this is more pronounced in the regions facing the earth than in those turned away from it, the consequence being an axial displacement exposing more of the eastern side. In *perigee*, on the contrary, the radial component increases and the effect is just the opposite with the result that more of the western side is seen. The moon actually swings on the axis passing thru its center of gravity on which it is supported like a ball on a string. The forces involved in these pendular movements are incomparably smaller than those required to effect changes in orbital velocity. If we estimate the radius of gyration of the satellite at 600 miles and its mean distance from the earth at 240,000 miles, then the energy necessary to rotate it once in a month would be only $\left(\frac{600}{240{,}000}\right)^2 = \frac{1}{160{,}000}$ of the kinetic energy of the orbital movement.

Close-ups of New Scientific Movies

(Continued from page 118)

play starring May Allison in "The Island of Intrigue."

Lawrence Waring, millionaire oil magnate, compelled to go East on business, worries about leaving his daughter Maida alone. The problem is solved by the arrival of a letter from Mrs. Juliet Smith, an old friend, who invites Maida to spend the summer at her country home on Sunset Island.

A woman, who says she is Mrs. Smith, calls later and Maida, who has never met her father's friend, goes aboard a yacht, en route for the island. She meets Maric and Lorna, Mrs. Smith's "son" and "daughter," and a "Count" Pellessier.

A few hours later the Waring house is in a state of alarm when the real Mrs. Smith arrives. It is then that Mr. Waring realizes that his daughter has been abducted.

In the meantime the yacht arrives at the island, but Maida, enjoying her holiday, does not realize that she is a captive. On one of her long walks thru the island she comes upon a camp and meets its owner, Gilbert Spear. She does not mention this to the others, but the meetings, begun as a lark, soon become a habit.

In the meantime the Count, by a wireless apparatus cleverly concealed in a piano, sends a message to Waring demanding fifteen thousand dollars as his daughter's ransom. He gets no answer and decides to force Maida to write of her peril to her father. On finding the true standing of the "Smiths," Maida refuses to write the letter and is at once locked in a room. The band have also discovered the friendship which exists between Maida and Gilbert, and after a fierce struggle he is captured, tied and gagged, and placed in a cave.

A second message is sent to Waring, which is also received at a Naval Station, and in this manner the location of the island is disclosed. A submarine chaser, with Waring aboard, goes to the rescue.

In the meantime Maida escapes from the room and flies to the camp. She finds Gilbert gone, but his dog, frantic with delight at her arrival, leads her to the cave. She soon releases him and together they hasten to his motor boat to escape. They are overtaken by the band and are just about to be taken aboard the yacht when the Naval boat comes upon the scene. The swindlers are captured and Maida introduces Gilbert to her father as the man she loves.

"America, First, Last and Always," is the theme of Pathé's new serial, "Wolves of Kultur," abounding in many thrilling radio scenes, underground and cave laboratories, and radio controlled torpedoes. It is the story of Alice Grayson, a cultured young society lady of wealth and refinement, possest of an ardent patriotism which has been stimulated by the completion of the invention by her uncle of an electrically driven wireless controlled torpedo.

Visiting her uncle's laboratory one day Alice finds he has been foully murdered by alien spies, and the plans and model of his invention stolen. Over his dead body Alice vows vengeance for his murder and for this traitorous act to America. She has learned from her uncle before he dies that "Hartman and Zaremba are guilty of this."

Alice, in her rôle of a Secret Service Agent, has finally located the death-dealing torpedo and the operator awaiting orders.

Before she can interfere the torpedo has been launched and is sent on its deadly mission, against a U. S. troop ship, when Alice, in a most superhuman effort, throws a rock at the operator and knocks him out.

She seizes the wireless apparatus and turns the course of the torpedo against the yacht, aboard which are the plotters.

STRONGFORT
The Perfect Man

ARE YOU SLIPPING?

Are you losing your grip—your ability to DO things, to make any progress in your business or even to make good in your present position? If you wake up in the morning tired before you begin the day, with you back aching, your digestion out of order, your nerves frazzled, you brain befogged, **don't let yourself slip any further:** there's no toboggan slide so rapid as the road down to chronic ill health and the consequent loss of all enjoyment in life.

GET A GRIP ON YOURSELF

Don't wait a single day before taking steps to rid yourself of the ailments or bad habits that will be millstones about your neck as long as you live. If you don't free yourself from them. When a man is on the limited for the scrap heap, every day counts; what is easy today will be a heap harder tomorrow, almost impossible if you wait too long.

YOU CAN DO IT

You can have renewed vitality; health, strength, energy, all that makes life worth living, if you throw away all druggist's dope and take hold of yourself in the right way.

I'LL SHOW YOU HOW

I have shown the way out to thousands of men who knew they were losing their grip on things through indigestion, constipation, biliousness and other ailments; I have shown them how to gain the energy and strength of will to break off bad habits they knew were undermining their constitutions, how to build up and strengthen their vital organs, develop their muscles, and make live, active, red-blooded, forceful MEN of themselves again.

My book, **"Promotion and Conservation of Health, Strength and Mental Energy,"** will show you how they did it: how YOU can do for yourself what they did for themselves, in a simple, easy, natural way. Send for a copy—IT'S FREE. Enclose three 2c stamps to cover postage and packing and I'll mail it to you at once.

Listening to Theater Critics

(*Continued from page 105*)

are usually well patronized, by "between the acts" smokers and thirsty box holders, then phonograph selections are played thru the loud-talking telephones in the horns, and the public generally is pleased—both those that like music and the others, who will enjoy it anyhow. But the psychological moment always arrives, and we have our turn after the show when the horns are "unsuspiciously silent," while the audience files out, homeward bound, chatting among one another about the show, and incidentally handing out several hundred dollars' worth of valuable criticism and suggestions, which any theater manager would almost break his neck to overhear. But even tho his office has a screen door, or if he happens to adorn the passageway with his own graceful and frock-tailed form, he hears but little of real value.

Now, all is changed, however, for, thanks to the dictograph installation, our friend the theater manager can appease his heretofore unsatiated thirst for a knowledge of "what his patrons actually think of the performance" by simply manipulating a switch at his desk, which causes the voices, no matter how low they may be, to be picked up by the respective microphones switched into circuit, and reproduce loudly and clearly thru the loud-talking telephone in his office. In the summer when naturally the office would not be closed up so tightly, the regular head phones, which resemble the telephone operator's headgear or that of the wireless operator, may be used with exactly the same results. The advantage of the loud-speaking telephone for reproducing the conversations is that everyone does not care to be inconvenienced by placing a telephone receiver band on the head, especially when we think of some of our old-time friends—the theater managers, that we have met here and there, who like to, and mostly do, resemble some of our Fifth Avenue millionaires with their sporty neck-ties, spats and a one dollar Perfecto sticking nonchalantly in the southeast corner of their jibs; and then again, who in his wildest theatrical moments can even imagine a "regular" honest-to-goodness theater manager appearing *without* his silk hat, once he has left his hotel. Well, for these poor souls we will suggest that they have available a first-rate secretary who can record the conversation, or better yet, hook up an Edison dictaphone (phonograph) to the horn of the loud-talker and record the various criticisms, so that they can be reproduced later and studied more closely at leisure.

We should imagine that such an arrangement as this will be very valuable indeed to the modern theater, where the movement toward establishing desirable plays, etc., is being brought to more nearly meet the exact wants of the theater-going public. In other words, the American theater manager has for a long time been seeking for every possible opening to gain a more perfect relation between the box office and the patron of the theater, and well this might be so, for if a performance is such that it does not suit the people at the time the play is produced, then there is no use expending additional sums in trying to foist the unwanted play on the theater-going public. Sometimes, however, in the past, and, in fact, it may be said in most cases, one of the chief reasons for the failure of a dramatic or other play, has been that the manager and producers could not quickly enough ascertain the exact feeling or obtain a comprehensive survey of the collective ideas of the audiences viewing the first performance of the play until it was too late.

Earn $35. to $100. WEEKLY

ALL OR SPARE TIME

You can make $35.00 to $100.00 a week, I want hustlers, money-makers, to work with me, to advertise, sell and appoint agents. Biggest thing in years. City conveniences without plumbing. Used in any room. Sells on sight. Demonstrating tub furnished. Folds small, self-emptying, non-leakable. Guaranteed 10 years.

AGENTS MAKE SALES EASILY

Two sales daily means $60.00 a week. Leggett, Ohio, "Worked two hours, took two orders, profit $10.00." Hayhurst, Nebr., "Took 11 orders in 4½ days—profit $55.00, ordered 12 more tubs." Mannlog, Iowa, "Sold 10 tubs in one day—profit $50.00." Dellut, Nebr., "Sold 12 tubs in three days—profit $60.00." And hundreds of others making big money. 70 per cent of homes have no bath tubs. Experience and capital unnecessary. Credit given to the right man. Get full particulars and "special plan" off Pass.

Experimental Mechanics. Twist Drills

(*Continued from page 127*)

With this information on hand and a little practical experience on the subject, there should be no difficulty for the novice to become thoroly familiar with the handling of twist drills.

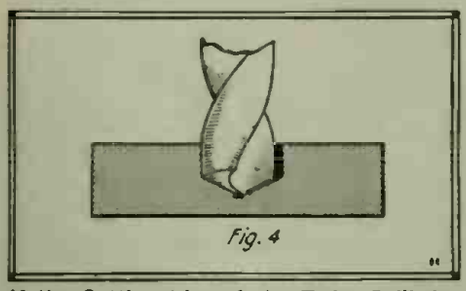

Fig. 4

If the Cutting Lips of the Twist Drill Are Ground of Uneven Length, the Hole Will Be Enlarged Over the Diameter of the Drill.

Average Cutting Speed for Drills In Revolutions Per Minute.

The following table represents the most approved practise in rate of cutting speed for drills ranging from 1/8 inch to 2 inches in diameter:

Diameter of Drills	Speed on Steel	Speed on Cast Iron	Speed on Brass
1/8	1,712	2,383	3,544
5/32	855	1,191	1,772
3/16	571	794	1,181
1/4	397	565	855
5/16	318	452	684
3/8	265	377	570
7/16	227	323	489
1/2	183	267	412
9/16	163	238	367
5/8	147	214	330
11/16	133	194	300
3/4	112	168	265
13/16	103	155	244
7/8	96	144	227
15/16	89	134	212
1	76	115	191
1 1/16	72	106	180
1 1/8	68	102	170

1 13/16	32	53	95
2	31	51	92

(The next article of "Experimental Mechanics" will appear in the July issue)

FRANCE BUYS BIG U. S. BORDEAUX RADIO STATION

Virtual demobilization of all the United States naval establishments in European waters, the sale of the great Lafayette wireless station at Bordeaux to the French government at a price of approximately $4,000,000 and many hitherto unpublished facts of American naval activities in the war, were announced recently by Assistant Secretary Roosevelt.

"The great Lafayette radio station near Bordeaux was intended to insure communication between Washington and the army and navy in case the cable systems were put out of commission or interfered with by German submarines. It has eight towers and could communicate with the United States day and night. It was built by the navy. I arranged with the French government that we shall complete the station, which is two-thirds finished, and they will take it over at what it cost us, about 22,000,000 francs," said Mr. Roosevelt.

SINCE 1880—

For two generations we have been making fine precision instruments—building them to the Starrett standard—not to a price.

Today the name Starrett is recognized the world over as standard for accuracy. Starrett Tools are helping skilled mechanics produce high-quality work.

In this Department we publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Regular inquiries address to "Patent Advice" cannot be answered by mail free of charge. Such inquiries are publisht here for the benefit of all readers. If the idea is thought to be of importance, we make it a rule not to divulge all details, in order to protect the inventor as far as it is possible to do so.

Should advice be desired by mail a nominal charge of $1.00 is made for each question. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

How to Finance and Manufacture a Patent*

By Jay G. Hobson

This article is dedicated to the interest of inventors and people with commercial ideas who are inexperienced in the financing and marketing of commercial products. It tells of a practical plan that made one invention successful. It is written with the intention that it will benefit each reader financially, and will assist him in avoiding the many pitfalls encountered along the road to success.—THE AUTHOR.

MOST people think of inventors as geniuses parturient to some brilliant idea suddenly caught from the air and patent it in workable form. However, this is not the case, for as Thomas Alva Edison, the great inventor, declares: "Genius is one per cent inspiration and ninety-nine per cent perspiration," and "The three essentials to secure anything worth while are, first, hard work; second, stick-to-it-iveness; and, third, common sense."

Edison's inventions have been the result of many experiments, and exacting judgment. He has always sought to produce things that were necessities, which would benefit the masses; consequently, his wonderful success.

The first important step in financing and marketing an invention is, positive conviction that you have discovered something that is practical, not only from a manufacturing point of view, but also from the public's point of view—for it is the co-operation of the public (your eventual customers) that will insure your success. To secure the co-operation of the public, and to sell your invention, be positive you have something to offer that the public needs and demands. Then, after you have made your article commercially practical, prepare it for the market in a convenient form, that will offer the least resistance to the consummation of a sale.

Investors or people with capital (who want to assist you financially in marketing your product) observe your invention and are of the same frame of mind toward it as the public—your ultimate customers. Investors scrutinize the practicability of the commercial side, as well as the production or manufacturing side; however, they are generally more interested in the commercial side of an article, for there is the source of large profits.

Obtaining financial backing for your invention is a serious undertaking. Investors demand facts, proof, conviction, before they will take the business venture necessary for the success of a new idea. Investors are the pessimists, so to speak, while inventors are the optimists. The inventors who succeed with their figments are greater optimists than men with money are pessimists. Conviction, confidence and enthusiasm will convert the most skeptical. Get the confidence of men with money and you will get their assistance.

Men who are successful say that the shortest route to commercial success is thru the example proven by those who have gone before. While modern business necessitates individual plans of operations, yet what one man or firm did to succeed others can duplicate. Therefore, the plan employed to finance and market one invention should help finance another. Experience proves that a patent is as valuable as the inventor or his associates make it—that completing a working model of an invention and securing the patent rights upon same are only the preliminary steps to success. The greatest obstacles lie ahead in the financing, manufacturing and marketing of a new article. It is the commercial wilderness that every new manufactured product must cross before reaching that summit of success desired by all.

It matters not how wonderful or unique an invention may be, it must be serviceably made, intelligently financed and greatly ad-

* Owing to the publication this month of the promised article—"How to Finance and Manufacture a Patent" by Mr. Hobson, the Questions and Answers on Patent Advice are omitted.

U.S. PATENTS

Don't Lose Your Rights

Before disclosing your invention to anyone send for blank form "Evidence of Conception" to be signed and witnessed. A sample form together with printed instructions will show you just how to work up your evidence and establish your rights before filing application for patent. As registered patent attorneys we represent hundreds of inventors all over the U. S. and Canada in the advancement of inventions. Our schedule of fees will be found reasonable. The form "Evidence of Conception" sample, instructions relating to obtaining of patent and schedule of fees sent upon request. Ask for them—a post card will do.

vertised to make the inventor money. The public must be educated to the need of a new article before they will buy it. Few inventors appreciate these facts, and are of the opinion that all they need do is to conceive some new, useful improvement, patent it, and their fortune is made; but unfortunately this is not true. It is only the beginning of a difficult undertaking. An inventor should be as good a salesman as he is a mechanic. The public must be convinced before they will invest. The better the salesman, the greater the financial backing. Inventors should sell themselves the merits of their invention before attempting to sell others. With the backing of the convictions that you have a good thing—it will make the convincing of others an easy matter. Confidence and credit in the commercial world are more valuable than gold itself.

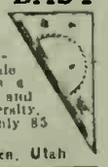
Only one who has gone thru a successful patent experience can adequately advise others how to succeed. For the benefit of my readers who may desire to finance a new proposition, I will enumerate the steps thru which I brought my first invention to success. It may help point the way for others.

After I had been granted full protection on my invention for a period of seventeen years, and had settled with my patent attorney for his services, it suddenly dawned upon my elated conscience that my patent certificate, with its big red seal, was not cashable like a Government bond; but, that it was only the foundation and beginning of a steep, rocky road to fame and fortune. I had spent most every cent for my patent rights and a demonstrating model of my invention. I had no money to promote the sale or manufacture of same, but I did possess an abundant confidence in its usefulness and ultimate success, if only I could secure financial backing to put it on the market before the buying public.

As it stood it was absolutely valueless to me. One of two things was necessary for its success. Either I must sell it to some one with money, or raise the capital to manufacture it myself. My friends urgently advised me to sell for any fair profit above my actual cost, saying: "It was better to accept a profit regardless of size than possibly fail in securing sufficient capital for marketing it."

Thru courtesy I listened to all this sincere advice, but was of the same opinion still—that my invention filled a long-felt public want. It was a necessity that could be made easily and profitably. I determined to stick to the first meritorious product of my brain and if possible raise the money that would enable me to place it for sale before the world. I knew that success only waited upon the introduction of my discovery to those for whom it was intended. But how best to accomplish this seemingly impossible task and overcome the colossal obstacles that were in evidence, forced me into quite a quandary.

However, remembering the old adage, "Where there is a will, there is a way," spurred me on to greater hopes for the success of my invention. I decided to tackle this proposition for all it was worth, and reap the benefits that were justly mine.



At that time I was a typical amateur in the mysteries of finances. I could not afford to make mistakes and knew few plans to pursue in obtaining the required finances for marketing my invention. Several plans came to my mind, such as borrowing the capital from relatives or friends, giving my patent as security for the loan; organizing a stock company and selling shares of stock to raise the money; or, advertise and sell part interest in my patent to some one, honest and reliable, who would agree to buy only a minority interest, thereby giving me control and protection against loss—for I was determined that I would not be frozen out by a partner.

www.americanradiohistory.com

The first plan had its precipitous faults. Relatives as a rule do not make good creditors and seldom appreciate their kin's abilities in business. The second plan meant immediate cash for incorporation of a company, as well as a long drawn out, expensive stock selling campaign, with capital possibly coming in by dribbles. The third plan appealed to me more favorably. I decided to put forth my best efforts toward this method of placing my invention on the market. How and where to find the investor with the cash who would be willing to invest under the above conditions proved to be my greatest problem. After considerable deliberation, after several demonstrations and interviews with business men whom I knew, I was convinced that the quickest and cheapest way to find *that* person with the idle cash and confident enough to take a legitimate business chance with me, was to advertise in some good newspaper or magazine, under "Business Chance." This I forthwith started and used the following advertisement:

"Wanted, a capable business man with capital to take substantial interest in patented meritorious invention. This is a public necessity that should make fortune for manufacturers. If qualified, address ———, etc."

The above advertisement cost about $1.00 per issue under classified position in a paper having a weekly circulation of upwards of five hundred thousand copies. The first replies were somewhat disappointing. But, believing I was headed right, I continued the advertisement for a few weeks, and one day I received an inquiry from a man who had ready cash, and sufficient optimism to back me up in my great ambition. For $2.000 cash I sold him forty-five per cent interest in my patent right (leaving me fifty-five per cent, or control). With this nest egg in the company's treasury we proceeded to gather all the information that we might need in the manufacturing and marketing of our invention.

First, we decided upon a firm name suitable to the article. Then we arranged with a machinery company to construct the machinery needed for quantity production. We called on the supply houses and secured their lowest prices on material for making our product. We arranged for the printing of circulars, letterheads, envelopes, bill heads, statements, etc., that would be needed for our office. From a bookkeeper friend we learned books required for our business and how to keep them correctly. We called on the wholesale and retail deal-

Hunting Submarines by Sound

(*Continued from page* 111)

"Ship ahoy!" came from the masthead.

"Where away?"

"Two points on the starboard bow, sir. Looks like she was heading this way."

The Ear Beats the Eye.

This vessel had been detected by sound waves traveling thru the water, her course and speed had been accurately charted *and her exact position* within one point of the compass had been determined *more than an hour before the vessel itself had become visible over the horizon.*

"It's almost perfect," said one of the naval engineers in an undertone. The tension under which they had worked for hours suddenly relaxed. The ship's crew gathered in groups to talk it over. There was not a dissenting opinion. The secret of detecting the presence of an unseen vessel had been solved!

DETROIT

the Automobile Center of the World is the Logical Place to

LEARN AUTOMOBILE ELECTRICS

Training for Head and Hand

Auto Electricians are in big demand everywhere. Interesting work—big salaries—exceptional opportunities for advancement. Every garage, factory and service station needs one or more good men. Also splendid opportunities to open electrical service stations and make big money. Cars need constant attention. Nearly all the trouble is electrical. Six million cars now in use—a million and a half new ones will be put in service this year. That means thousands of trained men will be needed. Men trained in Detroit get the preference.

NOT A "ONE MAN SCHOOL"

The M. S. A. S. embodies the best ideas in the Auto Industry No other school offers such an advantage as this school here in Detroit School open all the year, enter classes any day.

KING MOTOR CAR COMPANY

Builders of King Cars — Detroit, U.S.A.

Replying to a recent letter addressed to Mr. Artemas Ward making inquiry as to the reputation of the Michigan State Auto School, will say that as far as we know all Detroit Automobile manufacturers endorse the work they are doing.

It is managed very efficiently and they have been turning out some pretty good men for the automobile industry, and cannot see any reason why you should hesitate about taking a course with this Institution.

Yours very truly
KING MOTOR CAR COMPANY.

MONEY-BACK GUARANTEE

We guarantee to qualify you for a position as chauffeur, repair man, tester, demonstrator, auto electrician, garage man, automobile dealer, Aeroplane motor mechanic or tractor mechanic and operator, paying from $100 to $400 monthly or refund your money.

Be An Auto Electrician
Earn $200 to $500 Monthly

If you are electrically inclined this is your best opportunity. Our complete Auto Course trains you thoroughly in Auto Electrics. You can hold down any job or run a business of your own. You make more money because you can locate trouble quickly, without waste of time. All your time is spent repairing the trouble—not looking for it. Our successful graduates are in every part of the world.

Auto Factories Heartily Endorse Our School

They not only endorse the M. S. A. S. but they also give us hearty co-operation. They employ our students while taking course and after they graduate. We have the latest model chassis for students to work on. In this way our students get best possible training in most practical manner.

"School News" and 176 Page Catalog FREE

Just off the press. Gives complete information. Quotes dozens of letters from students who have actually done what you would like to do. What better proof do you want that YOU can do it? You CAN! — but get busy. "Jump" a train and come to Detroit. Hundreds have done it and made good. Will help you get a job if necessary to pay expenses while taking our course. Get action NOW.

Michigan State Auto School The Old Reliable School
666 Auto Bldg. Detroit, Mich. U. S. A. A. G. ZELLER, Pres.

Earn $35 to $100 a Week

As a Mechanical Draftsman

Thousands of Men Needed

YOU can learn Mechanical Drawing at home in your spare time through our practical Home Study Course and qualify for Big Pay. We have placed hundreds of our students in good paying positions. Government departments and private concerns are continually calling upon us for our graduates. Peace means a bigger demand for draftsmen than ever before. Prepare now and be ready when this demand reaches its height.

Become a Chief Draftsman

and get to the very top in this well-established and rapidly growing profession. The training given by the Columbia School of Drafting will give you just the knowledge you need to make good as a Chief Draftsman. No previous training is necessary. You can begin our course now and make rapid progress from the start by mail under the Personal Instruction of the President of the School, Mr. Claflin. His carefully prepared lessons and personal letters of advice make each step easy and interesting.

Draftsmen Now Getting $35 to $100 a Week

with big chances for better pay as the demand grows. All big engineering, construction and manufacturing projects must first go through the drafting room before the workmen can commence. All such enterprises depend upon large numbers of draftsmen. Salaries are advancing steadily.

Drawing Outfit Free With Our Course

Free As soon as you enroll you will be sent our drawing outfit for your own use throughout the course. This entire outfit will be yours to keep. You are not obliged to return it after completing the course.

We Will Help You Secure a Position

as soon as you complete our course. We have already placed hundreds of our graduates in good paying positions and are constantly in touch with vacancies for which draftsmen are urgently needed.

Illustrated Catalog FREE

Free Simply fill in the coupon below, return it to us and we will send you free a copy of our illustrated catalog which tells all about our practical Home Study Course and how you may secure our instructions at once on easy terms so as to quickly qualify for one of the big positions open.

Send This Coupon Today

The ships steered back to Nahant. A long-distance call was put in for the Navy Submarine Base at New London.

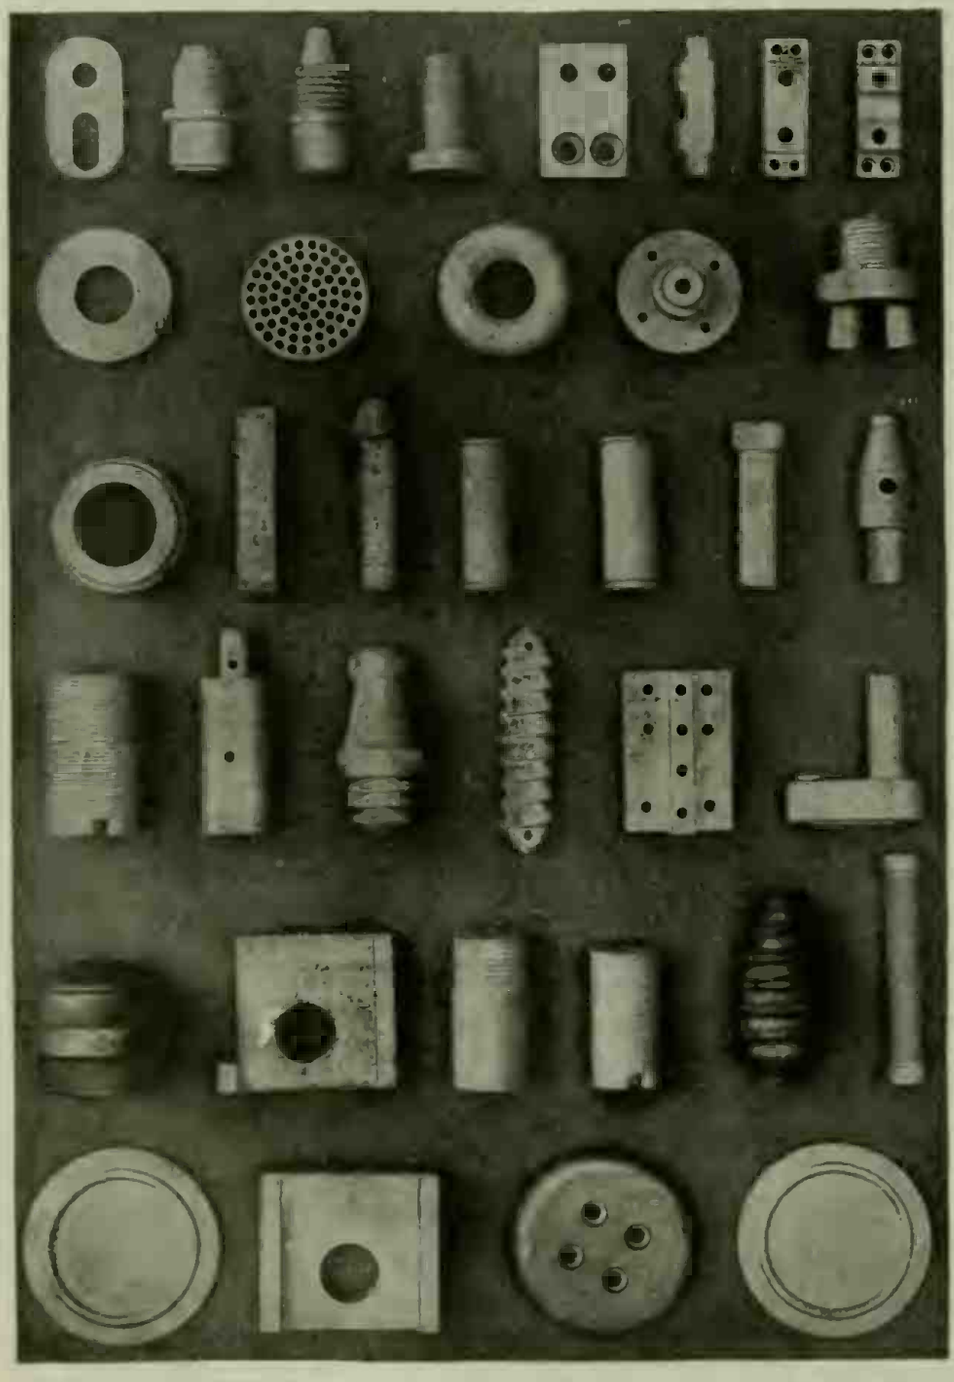
"Rush three submarine chasers to Nahant at once."

In due time they appeared. The party started out again, were joined by submarines from the Boston Navy Yard, and anchored off the Massachusetts coast line.

One submarine at a time submerged. The subchasers equipt with detectors followed her every movement, charted her position, reported to each other by special signal devices, and when everything was in readiness rushed to a spot just over the "sub." Dummy depth bombs were dropt. The submarine rose to the surface. *She had been within a few feet of her charted position.*

And now the apparatus was about to demonstrate its most valuable service. A series of practical tests proved beyond the possibility of a doubt that the detector could successfully differentiate between the sounds made by surface craft and the sub. The submarine's noises were distinctly peculiar to itself and the instrument translating this sound to the trained ear brought home the message just as you, when you pick up the long-distance telephone receiver, can identify the voice at the other end of the wire.

The Submarines On the Phonograph.



The Victor Talking Machine Company was now called upon for its contribution to the invention. *Phonograph records of the various sounds heard by the observer were made and catalogued*, thus presenting a complete record of the accomplishment of the device. The records were used principally in training students to identify the submarine noises and detect the difference between submarine and surface craft.

Further tests were made. Shore listening stations were set up. During the night trained men sat and listened to vessels going in and out of Boston harbor. The Navy attempted to slip a submarine thru the harbor entrance one night, but the craft was detected at once and a full report of her activities was sent to headquarters a few hours later. Not a ship could enter or leave Boston without being heard. In fact, so sensitive was the instrument that *trained listeners could accurately identify a ship by name*, once having heard her, the engine characteristics of different ships being plainly audible and distinctive.

It was estimated that in December, 1917, *two to five enemy submarines past thru the English Channel daily*. After July 1, 1918, only *one* submarine is known to have done so. In June the Admiralty estimated that *one out of every four submarines was destroyed*. In October the ratio had been increased to five out of every twelve. By this summer British and American naval officers believe three out of every four submarines would have been destroyed. These results were largely due to the perfection of "listening devices."

Hundreds of British craft and most of the American forces were now equipt with the submarine detector. Many French and Italian vessels were also using it. The "submarine hunt" was on in earnest.

About May, 1918, the American ships

Lava Electrical Insulation

Lava Is

the ideal strong, hard, solid fireproof, non-corrosive Insulation. It is machined green, by sawing, lathe turning, milling, drilling and threading to any desired form. Then kiln hardened at 2000° and is unaffected by any subsequent temperature short of that heat.

It will withstand a far greater heat than the conductor which it protects!

Coefficient of expansion being negligible it is of especial value in instruments requiring a fixed relation of their parts under ALL conditions.

Lava Is Not

Molded—no cost or delays for dies or molds.

Glazed or colored. No stock or standard parts—everything being made specially according to design of customers.

Affected by acids or alkali.

Subject to variations in structure or composition (being a natural product).

Ask for P. J. Kruesi's book on "Lava for Mechanical and Electrical Purposes."

AMERICAN LAVA MFG. CORPORATION

Burners all forms for all gases. Heat resisting parts for gas appliances. Electrical Insulation

CHATTANOOGA, TENN.

www.americanradiohistory.com

began to go across with all these devices installed.

Hearing Subs 25 Miles.

Here are some of the outstanding features of the American submarine sound detector:

Under ideal conditions with extraneous noises reduced to a minimum or entirely eliminated *the device was effective at a range of from fifteen to twenty-five miles.*

Trained operators could clearly and invariably distinguish between the sounds made by approaching surface craft and under-water vessels (submarines).

Under average circumstances, the device was good for a range of between *three and eight miles.*

Within five miles the engine characteristics of different vessels was clearly marked even to the point of *identifying by name* certain (unseen) vessels after they had been observed previously for more than one time. (This test was substantiated by a series of night-time experiments at the entrance to Boston harbor in September and October, 1917.)

It was found practical to tell when a submarine changed from her oil engines to electrical drive, which was necessary every time she submerged.

The direction of sound could usually be computed within a very few degrees of its actual location and a good judgment of the distance could generally be made. This was proved to the satisfaction of all concerned following a number of practical tests off Cape Cod, Mass., in the late summer of 1917, in waters adjacent to Boston and in Long Island Sound.

The addition of these listening devices to submarines added the heretofore lacking *sense of hearing* to all the underwater craft and made them at once a much more effective weapon of offense.

An allied submarine on one occasion chased a German U-boat for four hours, while both craft were submerged, without once losing sound contact with the enemy.

The graphic chart publisht herewith will indicate to the reader the ability of submarine chasers to maintain "sound contact" with the enemy and the efficiency of the direction qualities of the device when used in this manner.

The actual battle engagement which it illustrates occurred one early morning in the English Channel. A small squadron of sub-chasers discovered an enemy craft moving slowly up the channel submerged. Forming for the attack they rushed over the spot where their listeners indicated the U-boat to be, dropt a pattern of depth bombs and then withdrew to take observations.

Feverish activity and the sound of hammers ringing against the ship's side was heard. The submarine engines would then start up and stop, start and stop again.

25 Germans Commit Suicide.

Further attacks were delivered and more noise came to the listeners from the hold of the submarine. Evidently the first depth charge had taken good effect and the enemy's crew was making a last desperate effort to reach the surface. Suddenly there was dead silence—then 25 revolver shots rang out—3 followed by 22. *The crew giving up in despair, had committed suicide.* The loss of this submarine was later substantiated by the British Intelligence Department.

When Capt. Leigh and his party went abroad in November, 1917, he requested the Admiralty to loan him two high-speed chasers in which operations could be begun in English waters, but was finally obliged to accept 3 trawlers of 9 to 10 knots speed, because of the then scarcity of higher speed craft.

Equipping these vessels with all of the anti-submarine detecting apparatus they went out in the English Channel on New Year's Day, 1918. Shortly afterwards a wireless message was picked up from an airship giving the position of a submarine which had just been seen to submerge. The channel had been laid out in numbered squares to facilitate the immediate location of enemy craft and the little squadron steamed over, got their devices out and picked up the submarine course.

When believing themselves about over the enemy, depth bombs were discharged and later a trawling instrument was used, which indicated that the submarine had been destroyed. Great quantities of oil rising to the surface also substantiated the success of the attack.

Remaining in English and French waters for several months, where the American devices proved of great value and were highly complimented both by Admiral Sims and British naval officers, another squadron was equipt and sent into the Mediterranean and Adriatic, where at this time submarine activity was at its height.

Because of the deeper water and less interference from surface traffic, listening conditions were unusually good. A "barrage" line of boats was organized across Otranto Straits, between the mainland and the Island of Corfu, to effectively put a stop to the enemy's free entrance to the Mediterranean.

Three of the chasers patrolling in formation abreast one dark night heard a "sub" approaching. The bearings obtained by the two beam vessels pointed directly toward the center boat. The middle boat now heard the submarine approaching from a position dead astern. The enemy came nearer and nearer and finally past right under the sub-chaser so close to the surface that those on board felt a wave of water along the keel of their ship.

When the German had past on and out in front the attack was made in unison, a *pattern** of depth bombs was "let go" and the little fleet halted for further observations. Pretty soon the whirl of the submarine's electric motors was heard—evidently in an effort to reach the surface.

The Germans "Cash In."

Then came a crunching noise not unlike the popping in of a blown-up paper bag. It was apparent that the submarine had been damaged—put out of control—and sunk, and that she had collapsed from the tremendous water pressure at these depths.

Many incidents of this kind occurred during the subsequent operations in foreign waters and several submarines were accounted for thru the direct aid of the American listening devices.

In fact, naval experts who were closely in touch with submarine detection development during the war period state with conviction that if the conflict had continued thru another summer the submarine would literally have been driven from the ocean, the promise of a condition due in a large measure to the perfection of submarine detecting apparatus.

It has also been stated that the noticeable change in naval tactics—from defensive to offensive—which marked this country's entrance into the war was largely caused by the application of American principles to the pursuit and attack of the U-boat, something made possible by the practical use to which it was found the American submarine detector could be put.

* A pattern of depth bombs refers to the plan of dropping them simultaneously in certain prearranged figures, such as squares, circles, etc. The chart herewith shows the pattern scheme quite clearly—notice the black dots at points marked "attack."

Mechanical Engineering

Learn at Home!

THE Government and employers everywhere are looking for men with mechanical ability. Splendid salaries and rapid advancement are offered.

There is an easy, delightful way in which you can learn right at home in spare time. For 27 years the International Correspondence Schools have been giving men and women just the training they need for success in mechanical engineering and more than 200 other subjects. Hundreds of thousands have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon below, then mark and mail it today. This doesn't obligate you in the least and it will bring you information that will start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon *now*.

TEAR OUT HERE

AMPLIFY YOUR RADIO SIGNALS

ONE of the greatest drawbacks since the invention of wireless telegraphy is the receiving of weak signals at the receiving station. Many devices were proposed to improve this condition, but without success, on account of the mechanical difficulties encountered in these amplifying devices.

However, this was recently solved by the introduction of an exceedingly sensitive microphone transmitter, which is known to detect sound waves with great accuracy and magnify them through an intermediate telephone circuit.

By the employment of the new DETECTAGRAPH-TRANSMITTER, the amateur can amplify the radio signals to such an intensity that he can hear the signals about his station without the need of the telephone head set.

By the addition of a loud talking telephone he is able to hear the messages many feet away from the instrument. He is also able to demonstrate the operation of his wireless apparatus to his friends.

The super-sensitive DETECTAGRAPH-TRANSMITTER herewith shown is two and three-eighths inches in diameter, five-eighths of an inch thick and weighs less than three ounces. It is the most sensitive sound detecting device ever brought before the public.

The manner in which the amplifying process is attained is by attaching with tape the DETECTAGRAPH - TRANSMITTER to the regular wireless receiver as indicated in the diagram.

SUPER-SENSITIVE

Detectagraph

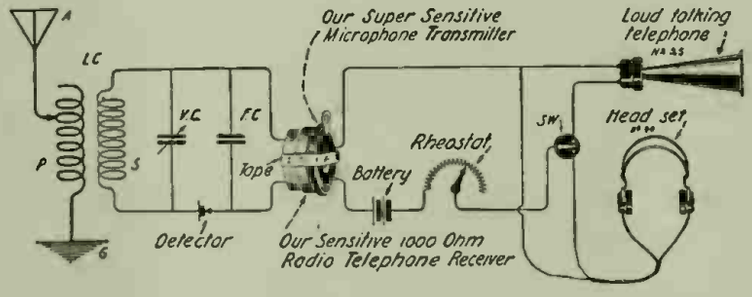
MICROPHONE DEVICES

Practical Instruments for Commercial and Scientific Purposes.

Our Super-Sensitive Detectagraph Transmitter. Price, $7.00 Complete

Other Uses

Not only is this instrument applicable for amplifying radio signals, but it can be used with equal satisfaction for magnifying other sounds. Phonograph music can be transmitted from one place to another by means of this instrument, and those who are afflicted with deafness will find enormous benefit by using this transmitter.



It is the greatest device for building your own loud talking telephone, detectagraph and other devices. Can be used for any purpose where a sensitive detecting instrument is required.

Model "B" Horn, with Loud Talking Receiver, Cord Plugs and Desk Stand Base Price, $10.00 Complete

Our Special No. 25 Loud Talking Receiver Price, $4.00 Complete

DETECTAGRAPHS

FOR THE EXPERIMENTER FOR DETECTIVES FOR THE DEAF

DETECTAGRAPH JUNIOR DEAF-PHONE

A super-sensitive instrument which has been developed to meet the demands for a practical and efficient hearing device at an extremely low price. Equal to any $35.00 instrument made.

The outfit consists of a Super-Sensitive Transmitter, with a cord connector; Super-Sensitive Ear Piece with small black cord; Black Single Headband; Black Case and two small Batteries. The Transmitter is 2¾ inches in diameter, ⅝ of an inch thick, and weighs less than three ounces.

$15.00 Complete

OUR NEW, IMPROVED DETECTAGRAPH

The outfit and case weighs less than two pounds and can be carried in the pocket, yet it is combined with certain features of our famous Detector, which makes it the most powerful and in every way, the most Microphone Detective Device the world has ever known.

Conversations carried on in an ordinary tone and even whispers are taken up by the concealed Detectagraph transmitter, which collects sounds from all directions and are conveyed over the wire to the listening end. This outfit consists of an Improved Sensitive Transmitter with cord connector; 25 feet Black Cord; Sensitive Receiver; Single Headband; Small Carrying Case and Small Battery. The Improved Transmitter is only 2⅝ inches in diameter, ⅝ inch thick, and weighs less than 3 ounces.

$15.00 Complete

Alexanderson's "Barrage" Receiver

(*Continued from page* 135)

ing which has become so familiar, but also the original meaning of toll or stoppage prevention. Thus the barrage receiver may be used not only in time of war to counteract the offensive barrage of an enemy radio station, but it may be used to multiply the number of peaceful communications that may be carried on simultaneously without disturbing each other.

Duplex Radiotelephony.

NEUTRALIZED RECEIVING ANTENNA MOUNTED ON THE SAME MAST AS THE SENDING ANTENNA

If two sets of wires are mounted on the same masts, the radiation from one set to the other is obviously so strong that the overpowering of an ordinary receiving set by the transmitted energy would be almost of the same order of magnitude as if the identical wires were used. The quantitative relations may be better appreciated by mentioning specific figures. In the tests made in Schenectady, the receiving antenna consists of five wires mounted as an umbrella

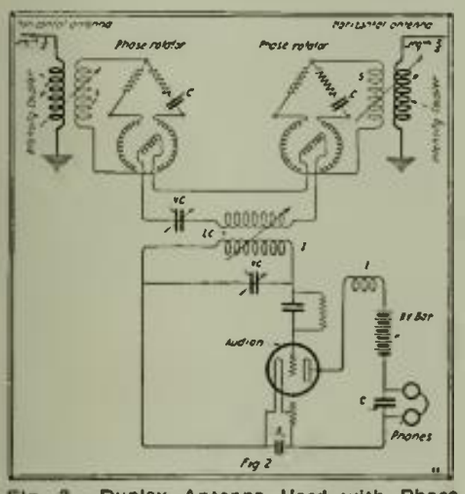

Fig. 2. Duplex Antenna Used with Phase Rotator Units and Regular Receiving Instruments in Alexanderson "Barrage" Receiving Set.

around the main mast, while the sending antenna consists of two wires extending from this mast to another building. The capacity to ground of the sending antenna is 0.003 microfarad, the receiving antenna 0.0011 microfarad, and the mutual capacity such that 10,000 volts on the sending antenna produces 500 volts on the receiving antenna when it is disconnected. While it is obvious that an antenna oscillating with 500 volts continuous waves could not be used with ordinary methods of reception, the system for neutralization which will be described has proven so effective that an ordinary receiving set can be used for receiving signals from such distances as the Pacific coast (2,500 miles or 4,000 km.) without any appreciable interference from continuous wave radiation from the main antenna of 20 amperes and 10,000 volts!

Two methods of neutralization have been used: *inductive* neutralization and *static* (*capacitive*) neutralization. While both methods have been used successfully, the capacitive neutralization is much preferable both on account of accuracy of adjustment and simplicity. A diagram of inductive neutralization is shown at Figure 1. The transformer *T* is used to create a potential of opposite phase to the potential of the sending antenna. The negative potential thus created is transferred to the receiving antenna thru the exposure condenser *E*. The negative potential thus imprest upon the receiving antenna thru the transformer and the exposure condenser is adjusted so as to counterbalance exactly the direct exposure from antenna to antenna, thus leaving the receiving antenna at ground potential. The phase relation of the transformer is, however, not exactly 180°, and a residual potential is left on the receiving antenna which is sufficient in most cases to interfere with reception unless further precautions are taken. If, however, a frequency trap *F* is introduced the neutralization becomes good enough so that an ordinary receiving set can be used.

The arrangement shown in Figure 1 was used to demonstrate duplex radio telephone conversation between Pittsfield and Schenectady (50 miles or 80 km.)

The "Barrage" Radio Receiver.

The barrage receiver is fundamentally a *uni-directional receiver*. The principle of uni-directional reception was first developed by Bellini and Tosi. While the uni-directional Bellini-Tosi receiver has been used as a direction finder, it has, to the knowledge of the author, not been used to any extent for reception of long distance signals. The Bellini-Tosi receiver is based on the principle of receiving the signal thru two antennas of different characteristics and neutralizes the signals received from one direction by a system of balancing.

The uni-directional Bellini-Tosi receiver works on the principle that the *electromagnetic* and *electrostatic* exposures are 90° out of phase. The *barrage receiver* takes advantage of the geographic phase *displacement* in the wave as it travels over the surface of the earth. In the first barrage receivers which have been installed the antennas consist of two insulated wires laid on the ground a distance of two miles (3.2 km.) in each direction from the receiving station. It was originally intended by the author to mount the wires on poles, but the easier procedure of laying the wires on the ground was adopted at the suggestion of Lieutenant-Commander A. Hoyt Taylor, and the arrangement has proven entirely satisfactory. The barrage receiving set, photograph of which is shown herewith, consists of a standard receiving set, combined with a *phase rotator* set. When used as a barrage receiver, a condenser is used in place of the antenna and the standard receiving set is coupled to the aperiodic antenna by the phase rotator set. The diagram of the phase rotator set is shown at Fig. 2. Each antenna is connected to ground thru an intensity coupler, the secondaries of the intensity couplers are connected to the primary of the phase rotators. Each phase rotator is built on the principle of a split phase induction motor or induction regulator. A single phase current introduced in the primary is split into a quarter-phase current which produces the equivalent of a rotating magnetic field inductively related to the secondary. By adjusting the position of the secondary coil the electromotive force induced in it may be made to assume any desired phase relation to the primary voltage. The receiving set proper when used with the barrage receiver has all the normal characteristics of a standard receiving set. A signal originating in any direction whatever may be neutralized by adjustment of the intensity couplers and phase rotators. This adjustment is very easy to perform, even by an inexperienced operator, and is perfectly stable after it has been made.

An experimental barrage receiving set was operated for several months of the

summer and fall of 1918, about three miles from the New Brunswick, N. J., radio station. Records were kept on the reception of European stations during the operation of the New Brunswick station. As the New Brunswick wave is 13,600 meters and the Carnarvon, Wales, wave is 14,200 meters, the reception of Carnarvon was the hardest test to which the set could be put. It was found that in spite of the overwhelming intensity of the New Brunswick signals on an unbalanced receiver, the barrage receiver could be adjusted so that the transmitted wave not only did not interfere with the Carnarvon signals, but the New Brunswick signals could be made entirely inaudible. During these tests it was found that the directive characteristics of the barrage receiver was a material help in reduction of interference by static and strays, as it was found very frequently that solid copy could be obtained by proper directive adjustment, while the signals were practically unreadable with ordinary methods.

The improvement of reception of signals by the use of the barrage receiver depends upon the highly directive qualities of this receiving system. For comparison with other methods of directive reception, a tabulation of directiveness is given in Fig. 3. In this comparison the symmetrical elevated antenna which receives equally from all directions is designated at 100 per cent. The percentages of directivity are calculated from the areas of the corresponding horizontal plane intensity diagrams here shown. If the directivity represented by the intensity diagrams can be taken as relative measure of the average stray-to-signal ratio, we find that the magnetic loop should have 50 per cent. as much strays as the elevated antenna, the differential horizontal antenna (Sayville, Long Island), probably about the same as the magnetic loop, and the barrage receiver 22 per cent. Statistics of reception indicate that these figures are reasonably in agreement with facts, when the strays are evenly distributed. When the strays are directive the improvement is much greater.

A rather surprising characteristic was discovered by the use of the barrage receiver. It was expected that this receiver could be used to neutralize signals from all directions except the direction close to the signal to be received. As a matter of fact it was found that interference could be neutralized by originating in the same direction as the signal. This was first discovered in the New Brunswick installation. Signals from San Diego, Cal., right in line with the transmitting station, could be received without great reduction in intensity, while the set was adjusted so as to neutralize the transmitting station. The explanation for this is the fact that in the case of the nearby station the wave front is curved and the radiation diverging, whereas in the case of the far-away station the radiation is parallel. The receiving antenna covers a space of four miles (6.4 km.), and in this space there is sufficient divergence of the radiation from the nearby station so that an adjustment can be made whereby the diverging and parallel radiation have different effect upon the receiving set. The phenomenon is comparable to the focusing of a field glass on nearby and distant objects. In this case we have a radio field glass of four miles (6.4 km.) in diameter; and, for such dimensions, the focusing effect is sufficient, even at considerable distances, to produce an effective discrimination.

While the barrage receiver was worked out primarily to avoid interference in transoceanic communication, it may be found useful also for the purposes for which the bridge receiver was developed—that is, simultaneous sending and receiving from small shore stations or ship stations. In such cases it has the advantage over the bridge receiver that it can be used not only to neutralize the transmitting station to which it belongs, but can neutralize interference from any other ship or shore station.

My Inventions

By Nikola Tesla

(*Continued from page* 148)

showered upon me, and journeyed to my home where I passed through a most painful ordeal and illness. Upon regaining my health I began to formulate plans for the resumption of work in America. Up to that time I never realized that I possessed any particular gift of discovery but Lord Rayleigh, whom I always considered as an ideal man of science, had said so and if that was the case I felt that I should concentrate on some big idea.

Nature's Trigger.

One day, as I was roaming in the mountains, I sought shelter from an approaching storm. The sky became overhung with heavy clouds but somehow the rain was delayed until, all of a sudden, there was a lightning flash and a few moments after a deluge. This observation set me thinking. It was manifest that the two phenomena were closely related, as cause and effect, and a little reflection led me to the conclusion that the electrical energy involved in the precipitation of the water was inconsiderable, the function of lightning being much like that of a sensitive trigger. Here was a stupendous possibility of achievement. If we could produce electric effects of the required quality, this whole planet and the conditions of existence on it could be transformed. The sun raises the water of the oceans and winds drive it to distant regions where it remains in a state of most delicate balance. If it were in our power to upset it when and wherever desired, this mighty life-sustaining stream could be at will controlled. We could irrigate arid deserts; create lakes and rivers and provide motive power in unlimited amounts. This would be the most efficient way of harnessing the sun to the uses of man. The consummation depended on our ability to develop electric forces of the order of those in nature. It seemed a hopeless undertaking, but I made up my mind to try it and immediately on my return to the United States, in the summer of 1892, work was begun which was to me all the more attractive, because a means of the same kind was necessary for the successful transmission of energy without wires.

Four Million Volts.

The first gratifying result was obtained in the spring of the succeeding year when I reached tensions of about 1,000,000 volts with my conical coil. That was not much in the light of the present art, but it was then considered a feat. Steady progress was made until the destruction of my laboratory by fire in 1895, as may be judged from an article by T. C. Martin which appeared in the April number of the *Century Magazine*. This calamity set me back in many ways and most of that year had to be devoted to planning and reconstruction. However, as soon as circumstances permitted, I returned to the task. Although I knew that higher electro-motive forces were attainable with apparatus of larger dimensions, I had an instinctive perception that the object could be accomplished by the proper design of a comparatively small and compact transformer. In carrying on tests with a *secondary in the form of a flat spiral*, as illustrated in my patents, the absence of streamers surprised me, and it was not long before I discovered that this was due to the position of the turns and their mutual action. Profiting from this observation I resorted to the use of a high tension conductor with turns of considerable diameter sufficiently separated to keep down the distributed capacity, while at the

Universal Radio Apparatus

The Universal Radio Manufacturing Corporation has taken over the business previously conducted by the Mignon Wireless Corporation and is prepared to furnish all of the Mignon system instruments, built according to the original Mignon specifications. In addition to these, the Corporation has recently perfected a series of new type instruments which for efficient work and real service have never been equalled.

Regerative Receiver, 200-2500 meters

The Universal complete line of High Quality Radio Apparatus now includes

Cabinet Receiving Sets
Transmission Sets
Loose Couplers
Undamped Wave Receivers
Time Signal Sets
Detectors, etc.

These "Universal" instruments embody the very latest advances in the art of radio communication and are far in advance of other instruments of this type. Every detail in their design has been carefully worked out, and the circuit constants have been computed with scientific accuracy to give maximum results when properly used. Materials and workmanship are of the highest quality.

Every piece of "Universal" apparatus must pass a series of rigid tests before being allowed to leave the factory, and we unconditionally guarantee every piece of "Universal" apparatus to be exactly as represented, and will cheerfully refund the purchase price if the instrument fails to make good for any reason.

Amateur Radio Restored

(*Continued from page* 131)

plaything only or just a mere hobby.

The ELECTRICAL EXPERIMENTER thru the RADIO LEAGUE OF AMERICA shall be only too glad to publish letters from amateurs suggesting new ways and means to benefit the cause of Radio Amateurism, our columns being open to all worthy suggestions.

While for the present there is nothing to be feared of adverse legislation, still it is impossible to forecast that such legislation will not be attempted in the future. We have won the freedom of the ether due to the splendid coöperation of Radio Amateurs in this country, and if we have won once we will win again.

The RADIO LEAGUE OF AMERICA is a clearing house for all Radio Amateurs in the United States, and today has more members than any other league, but it has not enough members. It wishes to have every amateur as an enrolled member. The membership of the Radio League, established in 1915, is gratuitous. There are no dues or fees to be paid. All the League wants is the name of every amateur and his address, so that first of all, if a national emergency arises, the Government can rely on the amateurs for quick communication. Also in case adverse legislation should be attempted, the League wishes to notify every member immediately, as it did last December when the freedom of the ether was threatened.

We ask every amateur who is not a member of the League to sign the blank appended herewith. It costs nothing but a 3-cent stamp to do so. Every enrolled amateur is entitled to the membership certificate free of charge which is mailed to all members. The membership of the Radio League of America now comprises 21,309 members. If you are not a member at the present time, you should enroll at once by all means.

LONG LIVE THE RADIO AMATEUR!

Application for Membership in the Radio League of America

I, THE UNDERSIGNED, a Radio Amateur, am the owner of a Wireless Station. My station has been in use since..... and I herewith desire to apply for membership in the RADIO LEAGUE OF AMERICA. I understand that the Radio League of America is a National Scientific Organization for the pursuit of the Radio Arts. I will not be called upon to pay membership fees, or dues, and once enrolled I am to share in all the privileges of a regular member.

Upon receipt of this form properly filled out you are to send me your eight-page booklet describing the purpose of the League, rules, etc.

Name.....

A NEW TYPE OF TRANSFORMER

(*Continued from page* 139)

(Nos. 20 to 30 gage), and is twelve inches long. The exact diameter cannot be given, but it must be slightly smaller than the inside diameter of the secondaries, usually from one to one and one-half inches.

The primary can consist of three pounds No. 16 D. C. C., which when connected in series with an adjustable reactance or rheostat, will give a power range of approximately two to six amperes.

The core is wound with two or three layers of Empire cloth, and then the primary wire is wound on. Between the primary and each secondary should be placed a hard rubber disc about an inch wider than the secondaries, and then the secondaries, covered with Empire cloth, are slipt in place. If a hard rubber disc is not available, three or four layers of the Empire cloth may be used. Great care must be taken with the insulation on account of the peculiar construction, and it is especially necessary that the insulation along the core, between primary and secondaries, be well taken care of. Connections for the secondaries are shown in the diagram (2).

When properly constructed, a thick spark, the length depending on the secondaries used, will be obtained. The transformer has proved especially good in use with a rotary gap.

A transformer constructed along similar lines, using two secondaries from a three-inch spark coil, has been giving me excellent service, and I hope other amateurs will have a similar experience.

Contributed by WM. HOLLADAY.

GERMANS' WIRELESS CODE

Dr. J. A. Fleming, in a lecture on "Electric Wave Telegraphy" at the British Royal Institution, revealed the fact that the Germans had, during the war, conveyed much important information from Tuckerton radio station in America by a code which was dependent on a certain method of "spacing," being otherwise harmless.

"I Would Not Part with it for $10,000"

So writes an enthusiastic, grateful customer. In like manner testify over 100,000 people who have worn it. Conserve your body and life *first*.

Learn WIRELESS —NOW— Enter This New Field of Greatest Opportunity

NOW that peace is here wireless offers the greatest opportunity of the day to the young men of America. The experimental stage has passed. Wireless now equals in importance telegraphy and telephony, and if the present commercial wireless program is carried out, it may supplant them by the end of 1919. It has earned its place among the great commercial industries of the earth. So great has been the development and growth of Wireless in recent years that there is now a tremendous shortage of operators.

Peace Increases Demand For Wireless Operators

Actually thousands upon thousands of Wireless Operators, Inspectors, Mechanics, Electricians, and Radio Draftsmen will be needed for permanent "peace time" wireless positions at bigger salaries than have ever before been paid.

Peace means a bigger demand for men in every branch of wireless and is opening up new fields of Commercial Wireless activity which will fairly revolutionize present methods of communication.

No Previous Experience Necessary

You Can Learn Wireless In Ten Weeks In Your Own Home, through our practical home study wireless course. No previous experience or training is necessary in order to become a Successful Wireless Expert With our help you can quickly qualify for a good position at big pay. Many of our students have secured positions before completing the course. You will make rapid progress from the start because our course is based on actual practice and teaches you what you will need to know to make a big success of Wireless work.

Get Your Instructions From the Nation's Capital

(Our Course is endorsed by U. S. Government Officials.)

The National Radio Institute headed by authorities who have been closely allied with government training of students, was established in 1914 and is the first school in America to successfully teach Wireless by Mail. The work is under the direction of J. E. Smith, E. E., director of the Radio Department, Howard University, and E. R. Haas, formerly of the Radio Division of Yale University.

We now have students throughout the world. Our location in the Nation's Capital together with the standing of our officers and their wide acquaintance among government officials, connected with Wireless activities, place us in position to give our students the best instruction obtainable and to be of the utmost help in assisting them to secure good paying positions.

Travel and See the World

If you want to travel and see the world—go to foreign countries, and increase your knowledge of world affairs, Wireless offers you the chance of a lifetime. However, you are not obliged to travel, but may secure a permanent position at one of the big Land Stations, Railroad, Telegraph, or Steamship companies, if preferred.

Pay as You Go Along With Your Lessons

Our plans of payment bring a wireless education within the reach of anyone who desires to learn. A small payment down on our convenient payment plan, and small following payments, enables you to earn the cost of your tuition while actually learning to be a wireless operator.

Earn up to $250.00 per Month

In the short period of ten weeks we can make of you a wireless operator, a man with a profession, independent, and not subject to the rise and fall of wages in the labor market. Salaries are as high as $250.00 per month. We give you this training at home, by mail, in your spare time. It is not necessary for you to lose any time from your work to take the course. Then when you have received your diploma from us, we help you find a good position.

FREE INSTRUMENTS TO EVERY STUDENT

In addition to text books, lessons and personal instruction, we send you, while taking our course, a Home Practice Set consisting of a standard sending key and buzzer, and a Universal automatic wireless transmitting and receiving set. These instruments are free to every student. No other school can offer you what we do.

Announcement - - Opening of Norfolk School

The demand for our Course has grown to such an extent that we are now preparing to open a school in Norfolk, Va., which will be under the management of Mr. A. H. Van Nostand, Radio Inspector of the Third Radio District.

FREE Our booklet, "WIRELESS, the Opportunity of Today", gives you complete information in regard to our course, the quick and easy methods by which you can master wireless and other important facts you should know. It is free. Just mail the coupon. No obligation whatever on your part.

—MAIL THIS COUPON TODAY—

NATIONAL RADIO INSTITUTE
Department 74, Washington, D. C.

Send me, free of charge, your booklet, "Wireless, the Opportunity of Today," with full particulars regarding your famous 10 weeks Home Study Course, and your Special Free Instrument Offer.

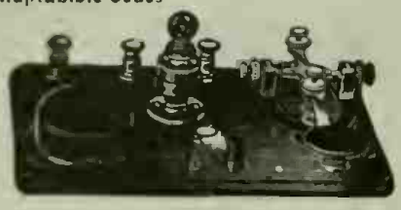
Wireless Receiving Ban Raised

MESCO WIRELESS PRACTICE SET

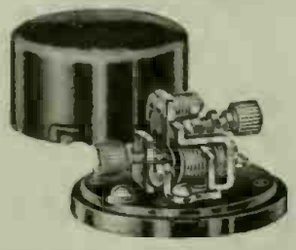


The Practice Set comprises a regular telegraph key, without circuit breaker, a special high pitch buzzer, one red lited Seal Dry Battery, and four feet of green silk covered flexible cord

The key and buzzer are mounted on a highly finished wood base, and three nickel plated binding posts are so connected that the set may be used for five different purposes.

List No. Price
342 Telegraph Practice Set, with Battery and Cord $3.24
Weighs 4 lbs. packed.
Price does not include postage.

MESCO Combination Practice Set for Learning the Morse and Continental Visual and Audible Codes



This outfit is the only reliable instrument which will enable students to become proficient operators in the U. S. Naval Service, because it is equipped with a buzzer and miniature lamp enabling the user to master both the visual and audible signals quickly

List No. 52—Practice Set with Red Seal Battery and Cord $4.05

Weighs 4 lbs. packed. Price does not include postage.

MESCO RADIO BUZZER

This buzzer maintains a constant note and is recommended as an exciter for checking wavemeters where pure note and ample energy are required

It consists of practically a closed circuit field of low reluctance, having a steel armature to which is riveted a strap supporting a movable contact. The armature tension is adjustable by means of a screw with a milled head large enough to be easily and permanently adjusted with the fingers. The stationary contact is adjusted by means of a similar screw. The magnet coils are connected in series with a total D. C. resistance of 3.9 ohms. Shunted across these coils is a resistance having a D. C. value of 3 ohms. This shunt eliminates all sparking such as occurs at the break on ordinary radio buzzers and the energy aved thereby is transferred into any oscillating circuit connecten to it, the result being that this buzzer as constructed radiates five times more energy than any other existing type. All connecting wires liable to be broken are eliminated. Contacts are of genuine platinum, which is essential in order to maintain a constant note. The parts are mounted on a Condensate base to insure constancy in operation.

Diameter 2 in., height 1¾ in. The cap is attached to the base by a bayonet joint.

List No. Price
55 Mesco Radio Buzzer $2.05

We carry a Large and Complete Line of Standard Wireless Material Recognized by Experts as such with Competent Experienced Wireless Attendants in Charge

Send for the New Edition of Our Catalog W28

It is pocket size, contains 264 pages, with over 1,000 illustrations, and describes in plain, clear language all about Bells, Push Buttons, Batteries, Telephone and Wireless Telegraph Material, Electric Toys, Burglar and Fire Alarm Contrivances, Electric Call Bells, Electric Alarm Clocks, Medical Batteries, Motor Boat Horns, Electrically Heated Apparatus, Battery Connectors, Switches, Battery Gauges, Wireless Telegraph Instruments, Ignition Supplies, etc.

My Inventions

By Nikola Tesla

(*Continued from page* 173)

same time preventing undue accumulation of the charge at any point. The application of this principle enabled me to produce pressures of 4,000,000 volts, which was about the limit obtainable in my new laboratory at Houston Street, as the discharges extended through a distance of 10 feet. A photograph of this transmitter was published in the *Electrical Review* of November, 1898. In order to advance further along this line I had to go into the open, and in the spring of 1899, having completed preparations for the erection of a wireless plant, I went to Colorado where I remained for more than one year. Here I introduced other improvements and refinements which made it possible to generate currents of any tension that may be desired. Those who are interested will find some information in regard to the experiments I conducted there in my article, "The Problem of Increasing Human Energy" in the *Century Magazine* of June, 1900, to which I have referred on a previous occasion.

The Magnifying Transmitter.

I have been asked by the ELECTRICAL EXPERIMENTER to be quite explicit on this subject so that my young friends among the readers of the magazine will clearly understand the construction and operation of my "Magnifying Transmitter" and the purposes for which it is intended. Well, then, in the first place, it is a *resonant transformer* with a secondary in which the parts, charged to a high potential, are of considerable area and arranged in space along ideal enveloping surfaces of very large radii of curvature, and at proper distances from one another thereby insuring a *small electric surface density everywhere* so that *no leak can occur even if the conductor is bare*. It is suitable for any frequency, from a few to many thousands of cycles per second, and can be used in the production of currents of tremendous volume and moderate pressure, or of smaller amperage and immense electro-motive force. The maximum electric *tension is merely dependent on the curvature of the surfaces* on which the charged elements are situated and the area of the latter.

100 Million Volts Possible.

Judging from my past experience, as much as 100,000,000 volts are perfectly practicable. On the other hand currents of many thousands of amperes may be obtained in the antenna. A plant of but very moderate dimensions is required for such performances. Theoretically, a terminal of less than 90 feet in diameter is sufficient to develop an electro-motive force of that magnitude while for antenna currents of from 2,000-4,000 amperes at the usual frequencies it need not be larger than 30 feet in diameter.

In a more restricted meaning this wireless transmitter is one in which the Hertz-wave radiation is an entirely negligible quantity as compared with the whole energy, under which condition the damping factor is extremely small and an enormous charge is stored in the elevated capacity. Such a circuit may then be excited with impulses of any kind, even of low frequency and it will yield sinusoidal and continuous oscillations like those of an alternator.

Taken in the narrowest significance of the term, however, it is a resonant transformer which, besides possessing these qualities, is accurately proportioned to fit the globe and its electrical constants and properties, by virtue of which design it becomes highly efficient and effective in the

www.americanradiohistory.com

wireless transmission of energy. Distance is then absolutely eliminated, there being *no diminution in the intensity of the transmitted impulses.* It is even possible to make the actions *increase with the distance from the plant* according to an exact mathematical law.

This invention was one of a number comprised in my "World-System" of wireless transmission which I undertook to commercialize on my return to New York in 1900. As to the immediate purposes of my enterprise, they were clearly outlined in a technical statement of that period from which I quote:

"The 'World-System' has resulted from a combination of several original discoveries made by the inventor in the course of long continued research and experimentation. It makes possible not only the instantaneous and precise wireless transmission of any kind of signals, messages or characters, to all parts of the world, but also the inter-connection of the existing telegraph, telephone, and other signal stations without any change in their present equipment. By its means, for instance, a telephone subscriber here may call up and talk to any other subscriber on the Globe. An inexpensive receiver, not bigger than a watch, will enable him to listen anywhere, on land or sea, to a speech delivered or music played in some other place, however distant. These examples are cited merely to give an idea of the possibilities of this great scientific advance, which annihilates distance and makes that perfect natural conductor, the Earth, available for all the innumerable purposes which human ingenuity has found for a line-wire. One far-reaching result of this is that any device capable of being operated thru one or more wires (at a distance obviously restricted) can likewise be actuated, without artificial conductors and with the same facility and accuracy, at distances to which there are no limits other than those imposed by the physical dimensions of the Globe. Thus, not only will entirely new fields for commercial exploitation be opened up by this ideal method of transmission but the old ones vastly extended.

"The 'World-System' is based on the application of the following important inventions and discoveries:

"1. *The 'Tesla Transformer.'* This apparatus is in the production of electrical vibrations as revolutionary as gunpowder was in warfare. Currents many times stronger than any ever generated in the usual ways, and sparks over one hundred feet long, have been produced by the inventor with an instrument of this kind.

"2. *The 'Magnifying Transmitter.'* This is Tesla's best invention—a peculiar transformer specially adapted to excite the Earth, which is in the transmission of electrical energy what the telescope is in astronomical observation. By the use of this marvelous device he has already set up electrical movements of greater intensity than those of lightning and passed a current, sufficient to light more than two hundred incandescent lamps, around the Globe.

"3. *The 'Tesla Wireless System.'* This system comprises a number of improvements and is the only means known for transmitting economically electrical energy to a distance without wires. Careful tests and measurements in connection with an experimental station of great activity, erected by the inventor in Colorado, have demonstrated that power in any desired amount can be conveyed, clear across the Globe if necessary, with a loss not exceeding a few per cent.

"4. *The 'Art of Individualization.'* This invention of Tesla is to primitive 'tuning' what refined language is to unarticulated expression. It makes possible the transmission of signals or messages absolutely secret and exclusive both in the active and passive aspect, that is, non-interfering as well as non-interferable. Each signal is like an individual of unmistakable identity and there is virtually no limit to the number of stations or instruments which can be simultaneously operated without the slightest mutual disturbance.

"5. *The terrestial Stationary Waves.*" This wonderful discovery, popularly explained, means that the Earth is responsive to electrical vibrations of definite pitch just as a tuning fork to certain waves of sound. These particular electrical vibrations, capable of powerfully exciting the Globe, lend themselves to innumerable uses of great importance commercially and in many other respects.

"The first 'World-System' power plant can be put in operation in nine months. With this power plant it will be practicable to attain electrical activities up to ten million horsepower and it is designed to serve for as many technical achievements as are possible without due expense. Among these the following may be mentioned:

"(1) The inter-connection of the existing telegraph exchanges or offices all over the world;

"(2) The establishment of a secret and non-interferable government telegraph service;

"(3) The inter-connection of all the present telephone exchanges or offices on the Globe;

"(4) The universal distribution of general news, by telegraph or telephone, in connection with the Press;

"(5) The establishment of such a 'World-System' of intelligence transmission for exclusive private use;

"(6) The inter-connection and operation of all stock tickers of the world;

$15,000.00
COMPLETE WIRELESS OUTFIT
For Sale

General Description

15 KVA Motor Generator set. Motor is 440 volt, 120 cycle, 4000 R P M type, built to stand heavy overloads for indefinite lengths of time. Generator same specifications. Set is No. 3 phase, complete with all controls, starters, meters, etc.

Three transformers. Discharger of Rotary Type, condenser, etc.

Induction transformer of sufficient size to be used on any wave length up to 2000 meters with a 650 foot antennae.

Capacity of apparatus without extending:—

800 miles at day.
2800 miles at night.

Installed at a cost of over $15,000.00

The equipment comprising this outfit was the very highest type that could be bought; it is complete—ready to erect and operate without the purchase of other apparatus. Was in daily use when ordered sealed for the duration of the war. The outfit has been completely overhauled and is guaranteed to be in first class operating condition.

YOU can BUILD this PHONOGRAPH easily!
TREMENDOUS SAVING IN COST

You don't need to be a cabinet maker. We have made it an easy and a pleasant job with

Our Simplified Plans

We furnish blue prints, diagrams, motor, and all metal parts complete. You build the cabinet and assemble. A few hours' work, and you will have as fine a type of phonograph as any produced, and at a price away below what you would pay in a store.

Keep the Savings in Your Pocket

Your machine will play all records, will have a wonderful tonal quality, excelled by none. No need now for any family to be without a phonograph because of the cost. THE MAKAFONE solves the problem. BUILD IT YOURSELF AT LESS THAN ONE-FOURTH REGULAR COST, but equal to the high priced cabinet machines. Free Records with each outfit. SEND TODAY FOR FREE CATALOG and full particulars of our wonderful offer. *Many a manufacturer got his start in this way. Why not you? Build machines and sell to your friends. Ask us about this.*

AGENTS ATTENTION

You can make and sell this machine from our plans at a profit of $50 to $75 each. Others are selling two and three a week. Here is your opportunity to make big money and become independent. Pleasant and profitable work. START TODAY.

Boys! You Can Make Your Own Electrical Apparatus with the aid of these wonderful books

Home-made Electrical Apparatus

By A. M. Powell

Three wonderful big books, chuck full of just the sort of information you have been looking for and at a price within reach of your pocket book. Each volume is printed on heavy paper, contains 75 pages and over 60 illustrations, complete working drawings for making every sort of electrical apparatus. Written so you can understand them. The price is only 25 cents per copy—practically the cost of publication. See partial table of contents below and order now. The supply is limited.

Vol. I Contains *working drawings* and directions for making all sorts of Static Machines, Static Apparatus, Home-made Batteries, Storage Cells, Transformers, Rectifiers, etc.

Vol. II contains *working drawings* and directions for all sorts of Voltmeters, Ammeters, Galvanometers, Switches, Rheostats, Telegraph Keys, Sounders, Telephones, Shocking Coils, Spark Coils, Experiments, etc., etc.

Vol. III contains *working drawings* and directions for making all sorts of Dynamos, Motors, Electric Engines, Miniature Lighting Plants, Wireless Telegraph Apparatus, Tesla Coils, Wireless Telephone, Electroplating, Experiments, etc., etc.

Any of these wonderful books will be sent to you *postpaid* for 25 cents.

"(7) The establishment of a 'World-System' of musical distribution, etc.;

"(8) The universal registration of time by cheap clocks indicating the hour with astronomical precision and requiring no attention whatever;

"(9) The world transmission of typed or hand-written characters, letters, checks, etc.;

"(10) The establishment of a universal marine service enabling the navigators of all ships to steer perfectly without compass, to determine the exact location, hour and speed, to prevent collisions and disasters, etc.;

"(11) The inauguration of a system of world-printing on land and sea;

"(12) The world reproduction of photographic pictures and all kinds of drawings or records."

I also proposed to make demonstrations in the wireless transmission of power on a small scale but sufficient to carry conviction. Besides these I referred to other and incomparably more important applications of my discoveries which will be disclosed at some future date.

A plant was built on Long Island with a tower 187 feet high, having a spherical terminal about 68 feet in diameter. These dimensions were adequate for the transmission of virtually any amount of energy. Originally only from 200 to 300 K.W. were provided but I intended to employ later several thousand horsepower. The transmitter was to emit a wave-complex of special characteristics and I had devised a unique method of telephonic control of any amount of energy.

The tower was destroyed two years ago but my projects are being developed and another one, improved in some features, will be constructed. On this occasion I would contradict the widely circulated report that the structure was demolished by the Government which owing to war conditions, might have created prejudice in the minds of those who may not know that the papers, which thirty years ago conferred upon me the honor of American citizenship, are always kept in a safe, while my orders, diplomas, degrees, gold medals and other distinctions are packed away in old trunks. If this report had a foundation I would have been refunded a large sum of money which I expended in the construction of the tower. On the contrary it was in the interest of the Government to preserve it, particularly as it would have made possible—to mention just one valuable result—the location of a submarine in any part of the world. My plant, services, and all my improvements have always been at the disposal of the officials and ever since the outbreak of the European conflict I have been working at a sacrifice on several inventions of mine relating to aerial navigation, ship propulsion and wireless transmission which are of the greatest importance to the country. Those who are well informed know that my ideas have revolutionized the industries of the United States and I am not aware that there lives an inventor who has been, in this respect, as fortunate as myself especially as regards the use of his improvements in the war. I have refrained from publicly expressing myself on this subject before as it seemed improper to dwell on personal matters while all the world was in dire trouble. I would add further, in view of various rumors which have reached me, that Mr. J. Pierpont Morgan did not interest himself with me in a business way but in the same large spirit in which he has assisted many other pioneers. He carried out his generous promise to the letter and it would have been most unreasonable to expect from him anything more. He had the highest regard for my attainments and gave me every evidence of his complete faith in my ability to ultimately achieve what I had set out to do. I am unwilling to accord to some small-minded and jealous individuals the satisfaction of having thwarted my efforts. These men are to me nothing more than microbes of a nasty disease. My project was retarded by laws of nature. The world was not prepared for it. It was too far ahead of time. But the same laws will prevail in the end and make it a triumphal success.

Tesla Bulbs

(*Continued from page 134*)

scription of the phenomenon, as seen in a bulb without conducting electrode. It is observed under the following conditions:

"When the globe L (Figs. 1 and 2) is exhausted to a very high degree, generally the bulb is not excited upon connecting the wire *w* (Fig. 1), or the tinfoil coating of the bulb (Fig. 2) to the terminal of the induction coil. To excite it, it is usually sufficient to grasp the globe L with the hand. An intense phosphorescence then spreads at first over the globe, but soon gives place to *a white, misty light.* Shortly afterward one may notice that the luminosity is unevenly distributed in the globe, and after passing the current for some time the bulb appears as in Fig. 4. From this stage the phenomenon will gradually pass to that indicated in Fig. 5, after some minutes, hours, days or weeks, according as the bulb is worked. Warming the bulb or increasing the potential hastens the transit.

"When the brush assumes the form indicated in Fig. 5, it may be brought to a state of *extreme sensitiveness to electrostatic and magnetic influence.* The bulb hanging straight down from a wire, and all objects being remote from it, *the approach of the observer at a few paces from the bulb will cause the brush to fly to the opposite side, and if he walks around the bulb it will always keep on the opposite side.* It may begin to spin around the terminal long before it reaches the sensitive stage. *When it begins to turn around, principally, but also before, it is affected by a magnet,* and at a certain stage it is susceptible to magnetic influence to an astonishing degree. A small permanent magnet, with its poles at a distance of no more than two centimeters, will affect it visibly at a distance of two meters, slowing down or accelerating the rotation according to how it is held relatively to the brush. I think I have observed that at the stage when it is most sensitive to magnetic, it is not most sensitive to electrostatic, influence.

"When the bulb hangs with the globe L down, the rotation is always clockwise. In the southern hemisphere it would occur in the opposite direction, and on the equator the brush should not turn at all. The rotation may be reversed by a magnet kept at some distance. The brush rotates best, seemingly, when it is at right angles to the lines of force of the earth. It very likely rotates, when at its maximum speed, in synchronism with the alternations, say, 10,000 times a second. The rotation can be slowed down or accelerated by the approach or receding of the observer, or any conducting body, but it cannot be reversed by putting the bulb in any position. When it is in the state of the highest sensitiveness and the potential or frequency be varied, the sensitiveness is rapidly diminished. Changing either of these but little will generally stop the rotation. The sensitiveness is likewise affected by the variations of temperature. To attain great sensitiveness it is necessary to have the small sphere *s* in the center of the globe *L*, as otherwise the electrostatic action of the glass of the globe will tend to stop the rotation. The sphere *s* should be small and of uniform thickness; any dissymmetry of course has the effect to diminish the sensitiveness.

"The fact that the brush rotates in a definite direction in a permanent magnetic field seems to show that in alternating currents of very high frequency the positive and negative impulses are *not* equal, but that one always preponderates over the other.

"Of course, this rotation in one direction may be due to the action of the two elements of the same current upon each other, or to the action of the field produced by one of the elements upon the other, as in a

HB 16-Battery Charging Set

CHARGING AUTO BATTERIES
will Pay $150 to $250
Clear Profit Every Month

All you need is HB Equipment. The business is waiting for you—*right now.* More cars are being driven than ever before, with batteries to recharge, and all new Fords are equipped with storage battery. Start NOW to get these big steady profits.

This HB 16-Battery Charger Can Be The Biggest Money-Maker In Your Garage

Recharge 1 to 16-volt batteries or equivalent in 12- or 24-volt batteries at once. Current cost 12 to 15c each. Owner pays 75c to $1.50. Figure those profits. Compare them with other branches of your business! HB Chargers last for years—sturdy, economical, dependable. Finest materials and construction. Long service with *quick, clean, permanent profits.*

$57 Puts This Money-Maker in Your Garage on Money-Back Guarantee

Balance in 10 monthly payments of $23 each. Earnings pay for machine. No electrical knowledge necessary to install or operate. Uses 2 or 3 phase city current. Furnished complete with 2 charging panels capable of charging 1 to 8 batteries each. No burn-outs or expensive renewals. Nothing to wear out or break. Sold on HB Absolute Money-Back Guarantee. Order now—you run no risk. Pin your $57 Check to this ad and mail *today* for trial order.

series motor, without necessarily one impulse being stronger than the other. The fact that the brush turns, as far as I could observe, in any position, would account for this theory. In such case it would turn at any point of the earth's surface. But, on the other hand, it is then hard to explain why a permanent magnet should reverse the rotation, and one must assume the preponderance of impulses of one kind.

"As to the causes of the formation of the brush or stream, I think it is due to the electrostatic action of the globe and the dissymmetry of the parts. If the small bulb *s* and the globe L were perfect concentric spheres, and the glass thruout of the same thickness and quality, I think the brush would not form, as the tendency to pass would be equal on all sides. That the formation of the stream is due to an irregularity is apparent from the fact that it has the tendency to remain in one position, and rotation occurs most generally only when it is brought out of this position by electrostatic or magnetic influence. When in an extremely sensitive state it rests in one position, and most curious experiments may be performed with it. For instance, the experimenter may, by selecting a proper position, approach the hand at a certain considerable distance to the bulb, and he may cause the brush to pass off by merely stiffening the muscles of the arm. When it begins to rotate slowly, and the hands are held at a proper distance, it is impossible to make even the slightest motion without producing a visible effect upon the brush. A metal plate connected to the other terminal of the coil affects it at a great distance, slowing down the rotation often to one turn a second.

"I am firmly convinced that such a brush, when we learn how to produce it properly, will prove a valuable aid in the investigation of the nature of the forces acting in an electrostatic or magnetic field. If there is any motion which is measurable going on in the space, such a brush ought to reveal it. It is, so to speak, a beam of light—frictionless, devoid of inertia.

"I think that it may find practical applications in telegraphy. With such a brush it would be possible to send dispatches across the Atlantic, for instance, with any speed, since its sensitiveness may be so great that the slightest changes will affect it. If it were possible to make the stream more intense and very narrow, its deflections could be easily photographed.

"I have been interested to find whether there is a rotation of the stream itself, or whether there is simply a stress traveling around the bulb. For this purpose I mounted a light mica fan so that its vanes were in the path of the brush. If the stream itself was rotating the fan would be spun around. I could produce no distinct rotation of the fan, altho I tried the experiment repeatedly; but as the fan exerted a noticeable influence on the stream, and the apparent rotation of the latter was, in this case, never quite satisfactory, the experiment did not appear to be conclusive.

"I have been unable to produce the phenomenon with the disruptive discharge coil, altho every other form of these phenomena can be well produced by it—many, in fact, much better than with coils operated from an alternator.

"It may be possible to produce the brush by impulses of one direction, or even by a steady potential, in which case it would be still more sensitive to magnetic influence."

Fig. 6 shows a practical application of the Tesla bulb. The bulb itself, as will be seen, is excited by means of a Tesla high frequency alternator which, in turn, is connected to the primary of a transformer. The secondary of the transformer is grounded at one end, while the other end of the transformer connects with the Tesla bulb.

Dr. Tesla, in an interview, stated that

How to Finance and Manufacture a Patent

(Continued from page 167)

ers in reference to handling and pushing our goods, when ready for the market (using models of our invention for demonstration) and secured several substantial orders for future delivery. We also consulted an advertising agency about the future advertising of our product.

When the machinery for our little factory was completed we were ready for operation. After a few test runs, everything moved smoothly. In a short time, our factory was busily engaged filling the orders we had secured before starting. Before many months our sales began to mount into large proportions. The public were demanding more and more of our product. Business men began to get interested in our invention and its success. They began to uncover idle money they did not possess when I first asked for their backing. Several offers to buy us out were made from time to time, which we declined. One day the head of a supply company where we obtained the material for making our finished product made us a very attractive offer which we accepted. He knew of our profits better than any one except ourselves. This business man, my partner, not only received his investment, but a handsome profit besides; and I received more money for my patent than would have been possible had I sold it for "Whatever I could get," as my good friends advised.

In conclusion, I wish to suggest the following: If your invention has merit, is a public benefit or necessity, or an attractive novelty, do not sell out for "Whatever you can get," unless it is mighty good. If it is worth your best efforts to originate and perfect, it is also worth further efforts to raise the capital to manufacture it yourself. You might as well receive its full value instead of allowing some one else to do so. However, if you are forced to sell, and feel you cannot command the ability and persistence required to finance it yourself—don't be too anxious to close the deal. Don't accept the first offer made you. Of course, you should not turn it down entirely, consider them all, then decide and you will be sure of getting a fair price.

If your invention is a good one, and investors want it bad enough, they will keep after you until you sell. Fame and fortune come to Inventors who work hard while they are waiting.

RADIOPHONE BETWEEN STORES.

A prominent electrical and radio manufacturing concern of New York City will install, as soon as the ban on sending is lifted, a complete Radio Telephone System between their factory and several branch stores, so as to relieve a greater portion of the land telephone traffic between these units of the organization.

PERPETUAL MOTION?

What promises to be the world's greatest invention, according to a modest inventor hailing from Jersey City, is the "harnessing of gravity" to run a perpetual motion power plant of millions of horsepower, supplying us forever and ever (??) with light, heat and power almost free. ! ! ! In the near future, he expects to give his invention a "showing," and bring it into the light, till then—"We're from Missouri," he'll have to show us. So, beware! fellow experimenters and line your pockets with fish hooks—for Ssh! The inventor has distributed illustrated stock-selling brochures by the millions to get the billions he needs in order to wish this marvelous invention on a long suffering and struggling public.

Men Wanted for Airplane INDUSTRY

Wonderful opportunities—great scope for advancement—and big pay—await you in the airplane industry. This does not mean actual flying, but in any and all of the various branches of the industry. It is the coming profession—the future means of transportation. U. S. Mail is already being carried by airplanes. Factories are springing up everywhere and trained men are in big demand.

Openings in Many Branches You can get into this profession while it is still in its infancy as a mechanic, engineer, repairman, instructor, inspector, builder, contractor, salesman or professional aviator. The minute you understand the science and mechanics of aviation you can step into a high-salaried position.

We Guarantee Our Training

We absolutely and unreservedly guarantee that our Home Training Course will enable you to qualify for a good position as soon as you graduate. The Course itself has been written by noted aeronautical engineers, and covers the entire fundamentals of practical aeronautics. Every lesson is written and illustrated so clearly that you cannot fail to understand it. But see for yourself. Take ten lessons. Then if you are not satisfied you are not out one cent. We guarantee satisfaction.

Prepare Now for a Big Future

Only by specialized instruction can you expect to succeed in aviation or in any line of business. Training alone will fit you for a big job—and NOW is the time to begin. Check and mail the coupon for Big Free Bulletin and Money-Back Guarantee.

FOR EXPERIMENTERS ONLY!!

WE have in the past held many extraordinary sales, but we believe that the present one eclipses all by the wonderful values we are offering. The goods which we offer on this page are all standard telephone apparatus. Every piece we are offering is equipment that for one reason or another was discontinued by the telephone companies. If you wanted to buy any of the pieces which we offer herewith, from the manufacturers, the price would at least be ten times what we are asking for it. You can readily ascertain this for yourself by looking over our wonderful prices.

RUSH

Cut out and attach to your order. It will leave us within 24 Hours.

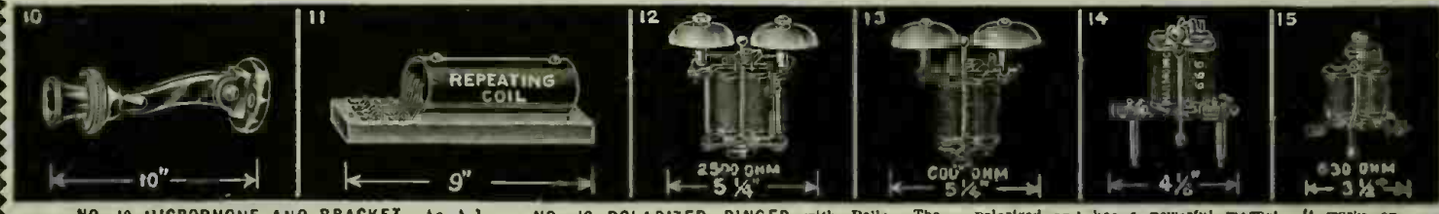
We have bought a large block of these goods and have a large quantity of every item on hand. Immediate shipment can be made on all of the goods in practically any quantity within reason. *Shipment within twenty-four hours* will be made if you use the adjoining coupon. This coupon saves you several days and your order will then be considered a rush order. We guarantee every piece to be as represented, and we will refund the money if goods are not exactly as claimed by us.

No. 1 TELEPHONE RELAY, 1500 ohms—has two silver-contact springs and is very sensitive. Can be used wherever a sensitive relay is needed. It is adjustable and can be used for a variety of purposes.
No. 1 Relay—shipping weight, 2 lbs. Price..... **$1.50**

NO. 2 STANDARD TELEPHONE induction Coil, primary 1 ohm, secondary 55 ohms. Used wherever you need a good induction coil. Has primary and secondary and iron wire core; fibre heads.
No. 2 Induction Coil as described—shipping weight, 2 lbs. Price..... **$0.50**

NO. 3 STANDARD RESISTANCE wound with German silver wire—4,500 ohms, can be used as a choke or plain resistance, and has many other uses that readily suggest themselves to the experimenter.
No. 3 Standard Resistance as described—shipping weight, 4 oz. Price..... **$0.40**

NO. 4 HORSESHOE MAGNET, size 3¼ inches wide x 5 inches high. Will lift about 1 lb. Quality such as used on magnetos, which means the best.
No. 4 Horseshoe Magnet — shipping weight, 2 lbs. Price..... **$0.30**



NO. 5 REPEATING COIL (Transformer). This is a standard small repeating coil and is used by all telephone companies. It has 4 different windings and eight contacts. Entirely enclosed in iron. The resistance being respectively 72 and 120 ohms, and 90 and 100 ohms. Diagram is furnished. Can be used for wireless, for boosting signals, etc.
No. 5 Repeating Coil—shipping weight, 2 lbs. Price..... **$0.50**

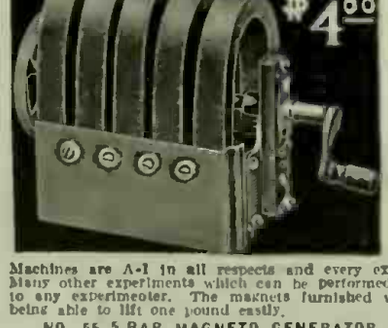
NO. 6 ½ M.F. CONDENSER. This is a standard telephone condenser and has ½ microfarads. Condenser comes in neat metal casing. This condenser is used in connection with spark coils to absorb the vibrator spark. Invaluable for test buzzers to absorb spark and make the sound of buzzer more steady. Is also used by every experimenter in connection with wireless where a fixed capacity is needed. Several of these condensers should be in every experimenter's laboratory.
No. 6 Condenser, ½ M.F.—shipping weight, 1 lb. Price..... **$0.50**

NO. 7 DOUBLE POLE BELL TELEPHONE RECEIVER—hard rubber casing with 4 ft. cord and tips. Standard 75 ohms—very powerful magnets. This receiver can be used in connection with any ordinary telephone work, and you will even find it sensitive enough for short distance wireless work.
No. 7 Bell Telephone Receiver—shipping weight, 3 lbs. Price..... **$0.80**

NO. 8 STANDARD TELEPHONE RECEIVER with Metal Head. This receiver is made by Stromberg Carlson Co., with genuine hard rubber handle and ear cap. A very good fool-proof as well as sensitive receiver that cannot be put out of order if you try. Used for the same purpose as No. 7 Telephone Receiver.
No. 8 Standard Telephone Receiver—shipping weight, 3 lbs. Price..... **$0.75**

No. 9 IMPEDANCE COIL (Close Core Transformer). This is a very fine little transformer and is used extensively in connection with telephone work. It is in reality an A.C. transformer for which you would pay $5.00 if you had it made to order. The primary has 0.15 ohms, secondary 2000 ohms. It can be used for a variety of purposes that will suggest themselves to every experimenter. Can be used successfully to boost wireless signals. Also in connection with audions, etc. An A-1 instrument. Size 3 x 3 inches.
No. 9 Impedance Coil—shipping weight, 2 lbs. Price..... **$0.65**

NO. 10 MICROPHONE AND BRACKET. An A-1 sensitive microphone of the carbon grain type. Has hard rubber mouthpiece and enamel steel bracket, the instrument being 10 inches long. This microphone, in connection with our No. 7 or 8 Receiver, will constitute a complete telephone outfit, good to speak 50 miles or more, at a remarkably low price.
No. 10 Microphone and Bracket—shipping weight, 5 lbs. Price..... **$1.00**



NO. 11 REPEATING COIL (Transformer). A standard repeating coil used for telephonic work. The coil windings are encased in an iron tube 2¾ inches in diameter. There are eight terminals for the four windings to connect to and the instrument is invaluable in connection with radio work to boost up signals, audion work, etc. Many interesting uses will be found for this coil. Resistances are: 100, 120, 145, 175 ohms.
No. 11 Repeating Coil—shipping weight, 8 lbs. Price..... **$2.00**

NO. 12 POLARIZED RINGER with Bells. The resistance of the two coils is 1250 ohms each. The armature is perfectly adjustable. Bell will work on any magneto. We also furnish blue print with ringer showing how a *first class polarized relay* can be made by anyone using only a few pieces of metal and screws.
No. 12 Polarized Ringer with Bells—shipping weight, 2 lbs. Price..... **$1.50**

NO. 13 POLARIZED RINGER with Bells. This is the same kind of ringer as the No. 12, except that it is not adjustable and that the resistance is less. First class in all respects. Blue print furnished with this to make *polarized relay* same as with No. 12. Solenoids on this ringer are worth more than the price we ask for the entire ringer, and do not forget a powerful magnet that goes with it.
No. 13 Polarized Ringer with Bells—shipping weight, 2 lbs. Price..... **$1.00**

NO. 14 HARMONIC RINGER. This ringer is also polarized and has a powerful magnet. It works on 66.6 cycles and any magneto will operate it if run at a certain speed. A very finely built instrument. Resistance of each coil being 200 ohms. Can be converted into a polarized relay by substituting a very fine leaf spring instead of the heavy one furnished. A most interesting instrument with which to experiment.
No. 14 Harmonic Ringer — shipping weight, 4 lbs. Price..... **$1.60**

NO. 15 RINGER without Bells—630 ohms. This also is a polarized ringer and has an adjustable armature. The adjustment is done by means of the top screw. A beautiful little instrument. With this instrument, too, we furnish a blue print showing how a *polarized relay can be built*. You should have several of these beautiful little instruments. They are worth their weight in gold; the powerful magnet alone being worth more than the price we ask for the entire instrument.
No. 15 Ringer—shipping weight, 2 lbs. Price..... **$0.80**

No. 55 5-bar magneto, 110 Volt A. C. Generator

This is one of the most powerful magnetos ever built, when manufacturers could afford to put good stuff into them; equipt with transmission, make and break, etc. Transmission wheels are all brass, crank handle furnished. This magneto, as well as the other ones listed below, will light a 110-volt lamp merely by turning the crank handle slowly. While this magneto gives alternating current only, it can be rewound so it will light up a number of four, six and 10-volt lamps, all depending upon the thickness of the wire you wind on the armature. As we furnish these magnetos, they will give a powerful alternating current and you will not be able to stand the current when grasping hold of the terminals. This makes an ideal shocking machine. All our generators can be transformed into a direct current machine by equipping it with a home-made commutator. Machines are A-1 in all respects and every experimenter should have one of them in his shop. Many other experiments which can be performed with this machine will readily suggest themselves to any experimenter. The magnets furnished with these generators are very powerful, each one being able to lift one pound easily.

NO. 55 5-BAR MAGNETO GENERATOR as described—shipping weight, 25 lbs. Price..... **$4.00**

NO. 33 3-BAR GENERATOR, same as described above except that it has only 3 bars, and is somewhat smaller.
No. 33 3-bar Generator—shipping weight, 10 lbs. Price..... **$2.00**

NO. 44 4-BAR GENERATOR, same as No. 55 except that it has 4 bars, and is somewhat smaller.
No. 44 4-bar Generator—shipping weight, 15 lbs. Price..... **$3.00**

NO. 66 6-BAR GENERATOR, same as No. 55 except that it has one more magnet and the armature is somewhat larger and more powerful. This is the biggest type made and is extremely powerful.
No. 66 6-bar Generator—shipping weight, 30 lbs. Price..... **$4.50**

Complete Wall Set

This is a complete commercial telephone station. The cabinet is of polished oak, piano finish, within which is contained the powerful magneto, the 300 Ohm polarized ringer, and induction coil. The magneto is exceptionally efficient, being of the two bar type with brass gear transmission. The extra sensitive microphone, mouthpiece and two gongs are mounted on the front of the cabinet, giving the entire instrument that desirable appearance of compactness and efficiency. Guaranteed to work over 20 miles. The telephone receiver is a double poled one, and has a hard rubber case. Seven binding posts are provided for connections. The instrument is one which we can offer with pride to our patrons at a ridiculously low price. It is unobtainable anywhere else at less than $15.00 and is an instrument unequaled in value for the price we ask. Size over all 11" x 10" x 8". Shipping weight, 15 lbs.
No. 26 Long Distance Telephone Set..... **$8.00**

Electric Drive on U. S. S. "New Mexico"

(*Continued from page* 106)

structions from the captain, sent either by loud speaking telephones, by indicators, by lights, or by messenger. Following these instructions, the engineers standing at the switchboard can start the vessel forward, or start it backwards; they can make it go many different speeds in either direction; they can run all four of the motors from one of the power plants, or from the other power plant; they can even split up the load so that one power plant will run two of the motors forward and the other power plant will run the other two "astern." Another combination they can effect is that both power plants can equally share the load of driving the four motors—one to each propeller.

If one of the propellers becomes foul the engineer can disconnect this motor from the circuit, and then all of the power in the two power plants is available for the three remaining motors.

Giant Motor for Each Screw.

Can you imagine a motor twice as high as a six-foot man? Can you imagine *one motor capable of doing the work of* 30,000 *horses working at three eight-hour shifts?* If so, then you can appreciate the picture which these made in their steel compartments. One of these giant motors is provided for each of the four propeller shafts. The screw is at one end of the shaft in the water, and the motor is at the other end of the shaft inside the ship. One reason for their efficiency is the fact that the shaft can be short as the motor can be close to the propeller. There is an additional advantage also, because the turbine generators can be located near the boilers, and this permits of a short steam pipe. These very desirable features are a result of electric drive, because it doesn't make any difference what is located between the power plant and the motors.

No Reversing Turbines.

With electric drive, no reversing turbines are necessary, *the reversing is done electrically.* So with the electric drive, the turbine in the power plant always runs in the *same direction* and at highest efficiency.

Electrical propulsion not only does away with reversing turbines, but also does away with reduction gears. The wonderful simplicity of the arrangement can be appreciated also when you remember that the battleship *Pennsylvania* has ten turbines and the *New Mexico* only two.

Propeller More Efficient.

Electric propulsion has another advantage in making the propeller more efficient. This is because, within limits, the faster a propeller turns, the less efficient it becomes. If it turns too rapidly, it merely churns the water, and therefore does not effectively drive the ship ahead. When turbines are directly connected to the propeller shaft, the turbine rotates too slowly to be at its best efficiency, and the propeller shaft rotates too rapidly to operate at its maximum efficiency. So you can look at electric propulsion as a means of speed reduction; for it permits the turbines to rotate at their normally high speed, where they show the best fuel economy, and also permits the propeller to operate at comparatively low speed, where it gives the best driving economy. Without electric propulsion, there were at many different speeds practically "compromise" arrangements, by which either the turbine was rotating too slowly or the propeller too fast. This is obviated in the *New Mexico*, which is one reason why, with one filling of her oil tanks, she can cruise over 50 per cent. further than with any other equipment. In fact, she can go 7,500 knots at 12 knots speed before it will be necessary to take on any more fuel.

Nearly 100,000 Horse Power.

The *New Mexico* is practically the only 100 per cent. electric boat. This will be seen by glancing over, or, better yet, carefully reading the following table, showing her electrical equipment.

Particular attention is called to the loud speaking telephones, 104 in number, located all over the ship. From three different transmitting stations the bugle calls or other instructions can be sent to all or any one of five different groups of these telephones.

Electrical Equipment

2	main generators	33,000 h.p.
4	motors for propelling	33,000 h.p.
6	dynamos	3,000 h.p.
6	air compressors	400 h.p.
2	vacuum pumps	80 h.p.
20	motor generator sets totaling almost	100 h.p.
4	boat crane motors	220 h.p.
2	anchor motors	250 h.p.
4	winch motors totaling	200 h.p.
20	turret motors	1,300 h.p.
10	ammunition hoists	500 h.p.
2	refrigerator motors	40 h.p.
8	motors in kitchen (Peel potatoes, mix dough and cake, and wash dishes, cut butter, make ice cream, meat grinder, all bread and cakes baked electrically.)	15 h.p.
6	in carpenter shop	20 h.p.
10	in machine shop	30 h.p.
6	in laundry (5 machines use electric heat)	10 h.p.
5	motors in print shop totaling	6 h.p.
14	pumps water	140 h.p.
4	oil pumps	8 h.p.
50	electric air heaters	30 h.p.
12	searchlights	300 h.p.
160	fans, 60 blowers, 6 electric toasters, 1 electric percolator, 15 electric irons, 104 loud speaking telephones, 176 ship service telephones, 170 fire control telephones, 2 Sperry electric gyroscopic compasses, 7 portable electric drills, 2 electric glue pots, 6 electric soldering irons.	

Airplane Speeds 300 Miles an Hour

An airplane with a speed of from 200 to 300 miles an hour which will bring America within a short day's journey of Europe, is the prospect held out by the invention of a French engineer, Auguste Rateau.

At the present time without the invention the higher an airplane mounts the less power does its engine develop on account of the rarefying of the air. The loss at 15,000 feet, for instance, is 50 per cent.

M. Rateau's device is said to be very simple. It consists of an arrangement by which the exhaust from the engine works a small turbine, which compresses the air drawn into the engine to normal pressure so that the engine develops full power no matter what the altitude. As the resistance of an airplane decreases enormously at high altitudes, it follows that the higher a machine fitted with the new device mounts the greater will be its speed. This fact, it is declared, was demonstrated by the famous German long-range gun.

It has been found that a heavy day bombing machine whose speed at 15,000 feet ordinarily did not exceed 80 miles an hour, made 140 miles an hour when fitted with this invention, an increase of 75%.

Typewriter Sensation

FREE TRIAL

Use as You Pay

Only $4.00 a month until the low total price of $53.15 is paid, and the machine is yours.

This is absolutely the most generous typewriter offer ever made. Do not rent a machine when you can pay $4.00 a month and own one. Think of it—Buying a $100.00 machine for $53.15. Cash price, $50.35. Never before has anything like this been attempted.

Standard Visible No. 10 Smith Premier

Perfect machines, Standard size, full 84 character one motion keyboard. The entire line of writing completely visible at all times, has the tabulator, the two-color ribbon, with automatic reverse, the back spacer, ball bearing type bars, ball bearing carriage action, in fact every late style feature and modern operating convenience. Comes to you with everything complete; tools, cover, operating book and instructions, ribbon, practice paper—nothing extra to buy. You cannot imagine the perfection of this beautiful reconstructed typewriter until you have seen it. I have sold several thousand of these perfect latest style Model No. 10 machines at this bargain price and every one of these thousands of satisfied customers had this beautiful, strictly up to date machine on five days' free trial before deciding to buy it. I will send it to you F. O. B. Chicago for five days' free trial. It will sell itself, but if you are not satisfied that this is the greatest typewriter you ever saw, you can return it at my expense. You won't want to return it after you try it—you cannot equal this wonderful value anywhere.

You Take No Risk—Put in Your Order *Now*

When the typewriter arrives deposit with the express agent $9.15 and take the machine for five days' trial. If you are convinced that it is the best typewriter you ever saw, keep it and send me $4.00 a month until our bargain price of $53.15 is paid. If you don't want it, return it to the express agent, receive your $9.15 and return the machine to me. I will pay the return express charges. This machine is guaranteed just as if you paid $100.00 for it. It is standard. Over one hundred thousand people own and use these typewriters and think them the best ever manufactured.

The supply at this price is very limited, the price will probably be raised when my next advertisement appears, so don't delay. Fill in the coupon today—mail to me—the typewriter will be shipped promptly. There is no red tape. I employ no solicitors—no collectors—no chattel mortgage. It is simply understood that I retain title to the machine until the full $53.15 is paid. You cannot lose. It is the greatest typewriter opportunity you will ever have. Do not send me one cent. Get the coupon in the mails today—sure.

Harry A. Smith, 738, 218 N. Wells St., Chicago

H. A. SMITH, 738, 218 N. Wells St., Chicago, Ill.

Ship me a No. 10 Smith Premier F.O.B. Chicago, as described in this advertisement. I will pay you the $44.00 balance of the special $53.15 purchase price, at the rate of $4.00 per month. The title to remain in you until fully paid for. It is understood that I have five days in which to examine and try the typewriter. If I choose not to keep it I will carefully repack it and return it to the express agent. It is understood that you give the standard guarantee for one year.

"The National Authority on Electric Wiring for Twenty-Five Years"

All You Need to Know About Wiring

is in the Latest Edition of

"Standard Wiring"

THIS year's edition, completely revised to date, is the only accurate book on electric light and power wiring and construction published.

The National Electrical Code, with all its new rules, is explained and illustrated. 52 of the latest and simplest tables which show, at a glance, just what size of wire is needed for any kind and size of lighting or motor installation, for any voltage, current and drop desired for any system. Direct Current, Alternating Current, single, two or three-phase. The latest Code Rules on grounding required on all work.

How to install and operate generators, motors and every kind of wiring device with diagrams of connections. Special chapters on illumination, House Wiring, Electrical Units and their Equivalents. The latest lamp data. Proper symbols to use to indicate outlets, etc., etc.

It Will Make You an Expert Wireman

Leather Cover - Pocket Size - 375 Pages - Price $1.50

Sent to any address, postpaid, on receipt of price

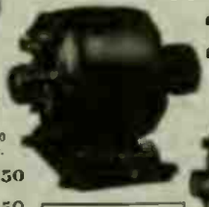
H. C. Cushing, Jr., 10 West 40th St., New York

YOUR OPPORTUNITY

Canceled Government Contracts

We have secured a large quantity of Small Motors, Generators and Charging Outfits. This material is new, still in original cases and carries the full factory guarantee.

This is Your Opportunity to buy new, guaranteed Electrical Apparatus of Standard Manufacture



Battery Charging Outfits

For use on 110 volt, A. C., 60 cycle, single phase current only.

60 watts, 6 volts, 10 amperes . $48.50
150 watts, 30 volts, 5 amperes . $68.50
150 watts, 15 volts, 10 amperes . $68.50
300 watts, 30 volts, 10 amperes . $94.50

All outfits complete with switchboard as cut shown

1/2 H. P. INDUCTION MOTOR 110 or 220 volts, A. C. 60 cycle, single phase, 1750 R. P. M. **$32.50**

ALL MOTORS COMPLETE AS CUT

Mail $5.00 cash or Money Order. We will send C. O. D. subject to full examination.

MONEY BACK GUARANTEE

1/4 H. P. 110 volts A. C., 60 cycle, single phase 1750 R. P. M.

WASHING MACHINE MOTOR

Suitable for operating Small Compressors, Coffee Grinders, Bottle Washers, Lathes, Drill Presses etc. **$18.50**

WRITE FOR CATALOGUE. BARGAINS IN MOTORS AND GENERATORS. SPECIAL QUANTITY PRICES

220 volts **POLYPHASE MOTORS** 1750 R.P.M.
60 cycle, 2 or 3 phase. Complete, pulley and base
1 H. P. $59.50 3 H. P. $ 84.50
2 H. P. $72.50 5 H. P. $102.50

NEW MOTORS

110-220 volts **REPULSION MOTORS** 1800 R.P.M.
60 cycle, single phase. Complete with pulley.
1/2 Hp. $44.60 1 Hp. $67.50

What 15c will bring You from the Nation's Capital

Washington, the home of the Pathfinder, is the nerve center of civilization; history is being made at this world capital. The Pathfinder's illustrated weekly review gives you a clear, impartial and correct diagnosis of public affairs during these strenuous, epoch-making days.

The little matter of 15c in stamps or coin will bring you the Pathfinder 13 weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation; a paper that prints all the news of the world and tells the truth and only the truth; now in its 26th year. This paper fills the bill without emptying the purse: it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send 15c to show that you might like such a paper, and we will send the Pathfinder on probation 13 weeks. The 15c does not repay us, but we are glad to invest in new friends. **The Pathfinder, Box 576, Washington, D.C.**

Tesla Bulbs

(*Continued from page 180*)

the best way to use the bulb for such experiments is when the shaft of light is in the position as shown in Figs. 5 and 6, at rest, but in a state of equilibrium inconceivably delicate. This is fully described above in Dr. Tesla's lecture. The inventor states that in such a condition, the shaft of light is marvelously sensitive to magnetic disturbances. Dr. Tesla informs us that a toy permanent horseshoe magnet not longer than ½" and with its poles ⅛" apart could with ease throw the shaft of light out of its normal direction across the whole room. In our illustration, an electromagnet is shown a few inches away from light ray, and we can imagine a slot in a screen in such a way that normally no light falls thru it. If, however, very faint radio-telegraphic impulses surge thru the electromagnet, the light ray will immediately become displaced, and will fall into the slot. Inasmuch as this shaft of light has no inertia, it will follow exactly the dot and dash impulses surging thru the electromagnet, no matter how rapidly they take place. They can then either be read off by the eye, or if desired, can be registered upon a fast moving film. This method will, of course, only be used where the transmission is made at high speed, and where it would be impossible for an operator at the receiving end to follow the dots and dashes with the eye.

The method shown by us in Fig. 6, of course, represents only one. Many others can undoubtedly be evolved to use the Tesla bulb to advantage.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912, of Electrical Experimenter, published monthly at New York, N. Y., for April 1, 1919.

State of New York, County of New York—ss.

Before me, a Notary Public in and for the State and county aforesaid, personally appeared Hugo Gernsback, who, having been duly sworn according to law, deposes and says that he is the Editor of the Electrical Experimenter, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations:

1. That the names and addresses of the publisher, editor, managing editor, and business manager are: Publisher, The Experimenter Publishing Co., 233 Fulton Street, New York City; Editor, Hugo Gernsback, 233 Fulton Street, New York City; Managing Editor, Harry Winfield Secor, 233 Fulton Street, New York City; Business Manager, Hugo Gernsback, 233 Fulton Street, New York City.

2. That the owners are: Experimenter Publishing Co., 233 Fulton Street, New York City; Hugo Gernsback, 233 Fulton Street, New York City; Sidney Gernsback, 233 Fulton Street, New York City; Mrs. K. Hymes, 233 Fulton Street, New York City; Harry Winfield Secor, 233 Fulton Street, New York City.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but, also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is —(Required only of daily publications.)

(SEAL) H. GERNSBACK.

Sworn to and subscribed before me this 4th day of April, 1919.

BEATRICE K. OWEN.

(My commission expires March 30, 1921.)

Choke Coils: Theory and Design

by Prof. F. E. Austin

(*Continued from page* 140)

It is evident that with a current of 13.9 amperes in a resistance of 2.9 ohms, there will be considerable heating effect, denoted by $R_x I^2_{dc} = 2.9 \times 13.9^2 = 560.3$ watts. If the current passes thru the circuit for one hour, about one-half kilowatt hour of energy will be paid for, which is simply a *heat waste* in the auxiliary resistance R_x.

When connected with a 110 volt alternating current circuit, the current of 13.9 amperes was maintained without this heat loss, simply because of the counter-electromotive-force of induction of the coil itself.

The financial saving effected by the use of a choke coil is therefore very apparent, since the coil reduces the current in the circuit from 22 to 13.9 or 8.1 amperes, at no operating expense for power.

The usual condition governing the use of a choke coil is either the amount of current to be past thru the coil is known, or the amount of pressure reduction is known.

The size of the wire constituting the coil must be large enough to carry the desired current without overheating the coil. The choking effect of any coil depends upon the *square of the number of turns* of wire composing the coil. That is, if the *number of turns* on a coil are *doubled*, its choking effect is increased *four* times.

A very serviceable choke coil for a wide range of choking effect may be made by winding ten pounds of No. 14 double cotton covered copper wire in two sections on a hard fiber tube, measuring 2 inches in outside diameter, and 9½ inches long. The tube should be provided with wooden ends about 4½ inches square and ¾ inch thick, with a middle partition of wood ¾ inch thick. It will be advisable to shellac the insulated wire very thoroly and allow it to dry before using the coil.

An iron core should be made up of about No. 18 iron wire stock, carefully varnished with shellac varnish, and measuring about 14 inches long by 1¼ inches in diameter.

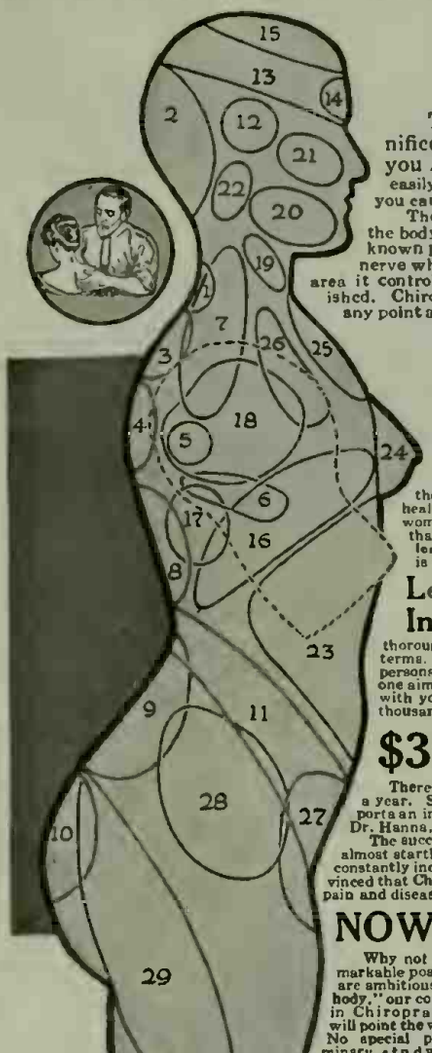
Such a coil will carry as high as 15 amperes for a short time and as high as 5 amperes for a long period without seriously heating.

With both sections in series, without an iron core and with an applied pressure of 110 volts at 60 cycles, the current in the coil will be about 0 amperes. The insertion of an iron core such as described above will reduce the current to less than ½ ampere.

With one section of such a coil, connected across 110 volts at 60 cycles, with no iron core, the current will be nearly 12 amperes, and by inserting the iron core may be gradually reduced from 12 amperes to less than one ampere.

Such a coil may be connected in series with other coils or lamps such as an arc lamp and the desired pressure applied to the apparatus. In using a choke coil always have the iron core inserted in the coil before closing the circuit, so as to have *maximum* choking effect in operation at the *start*.

The effect of the iron core is to greatly increase the coefficient of inductance L, thus increasing the numerical value of the term $2 \pi f L$. The iron core takes the place of a very large number of turns of wire, greatly reducing the expense of construction.



A very useful equation by which choke coils may be designed is as follows:

$$L = \frac{4 \pi n^2 \mu A}{10^9 b};$$

in which L denotes the inductance of a coil in *henries*; n denotes the number of turns on the coil, μ denotes the so-called magnetic permeability of the medium (iron, etc.), in-

Learn to Treat Disease This Way

This is a small reproduction of one of 22 magnificent charts all of which we want to send you ABSOLUTELY FREE, just to show you how easily you can master Chiropractic and bow successfully you can treat disease by this modern drugless healing method. These charts show the different pain and nerve areas of the body. The science of Chiropractic is based upon the well known principle that when there is bone pressure on a trunk nerve where it leaves the spinal column there will be pain in the area it controls: and that by relieving the pressure the pain is banished. Chiropractic teaches you how to locate nerve pressure at any point along the spinal column and how to relieve it.

BE A DOCTOR OF CHIROPRACTIC

Advanced Science of Spinal Adjustment

The great profession that within the past few years has taken the longest forward strides ever known in the history of drugless healing. It has called to its ranks thousands of ambitious men and women from every walk of life. Today it is calling more insistently than ever because the tide has turned strongly in favor of drugless healing. Right now the demand for Doctors of Chiropractic is far greater than the supply.

Learn at Home In Spare Time

The American University method of teaching enables you to study by mail or in class and obtain a complete mastery of Chiropractic in the shortest time consistent with thoroughness, while you hold your position. You can pay on easy terms. From the day you enroll your instruction will be under the personal direction of a splendid faculty of Chiropractic experts. Our one aim will be to make you successful. We will work whole-heartedly with you to advance your interests so that in a short time you, like thousands of Chiropractors, can earn a good income.

$3000 to $5000 a Year

There are many instances of Chiropractors earning from $3000 to $5000 a year. Some upwards of $10,000. Dr. M. D. Moore, of Kentucky, reports an income of $9,000 a year. Dr. L. H. Roche, New Jersey, $5,000; Dr. Hanna, of Kentucky, over $5,000 yearly.

The success of Chiropractors in many cases has come so quickly as to be almost startling. And yet, it is not to be wondered at when you consider the constantly increasing number of intelligent, thinking people who are now convinced that Chiropractic is the common-sense and really scientific way to relieve pain and disease and who, therefore, demand the services of Chiropractors.

NOW—Your Great Opportunity

Why not qualify now for this splendid profession that offers such remarkable possibilities for making you prosperous and independent? If you are ambitious to make money, increase your social standing and be "somebody," our course in Chiropractic will point the way. No special preliminary study required. You graduate with the degree of D. C. (Doctor of Chiropractic), receive handsome diploma, FREE, and are ready at once to open your office.

Get Free Charts offer at once. Regular value of the 22 magnificent charts is $31.50. Many of these charts are handsomely lithographed in life-like colors. Mail coupon and get all the facts. We will send you our beautiful new illustrated book, full particulars regarding course, easy terms, together with free charts offer immediately. Don't put it off—mail coupon or send your name on a postal card—today.

CONCENTRATION SPELLS SUCCESS

When rightly used, but when wrongly used it is sure to bring failure.

Most persons use their Concentration wrongly by concentrating on that which annoys, irritates and makes for failure.

You lock the doors and windows of your home to keep out thieves who would steal your property, but do you lock the doors and windows of your thought world and so keep out the power, ambition and ability?

Concentration when rightly used is a man's greatest asset but when wrongly used becomes his greatest liability.

Do you use your Concentration rightly or wrongly?

Has your Concentration brought you success or failure; happiness or sorrow; health or sickness; brilliancy of mind or loss of memory?

"Concentration—Its Mentology and Psychology"

teaches how to develop and use one's Concentration rightly.

The person who can concentrate rightly for what he wants, when and where he wants to—whether it is for money, health, love, increased business, political power, social position, a better job, good memory or anything else he may desire—has at his command the greatest power in the world—a power which, when he learns to use it rightly gives him the mastery of himself and his environment.

You have this power and can learn to use it rightly by persistently applying the lessons taught in Dr. Sears book.

Take no substitutes; none other "just as good." Price 50c paper; 75c cloth, postpaid. Money back if you want it. For sale at first class book stores or by mail direct from publishers.

CENTRE PUBLISHING COMPANY
Suite 678, 110 W. 34th Street (at Broadway), New York

Note—Dr. F. W. Sears lectures Sundays 11 A. M. in the Criterion Theatre, Broadway at 44th St., New York City

OFFER No. 1

Wireless Course

The most comprehensive Wireless Course ever printed. Contains 160 pages, 350 illustrations. Size of book 6¾"x10". Very fine flexible cloth cover.

FREE with a year's subscription.

Add 5c for postage

OFFER No. 2

Experimental Electricity Course

This masterpiece contains 160 pages, 400 illustrations. Size of book 5"x9". Printed on extra thin paper, so book can be slipped into pocket. Handsome flexible cloth cover.

FREE with a year's subscription. Add 5c postage

OFFER No. 3

How to Make Wireless Sending Apparatus
By 20 Radio Experts

How to Make Wireless Receiving Apparatus
By 20 Radio Constructors

These books are by far the most successful wireless books on the market. Size of each book 5"x7", well bound on good book paper. Covers in two colors. We really cannot praise these books too highly. Each book contains 100 pages and from 88 to 90 illustrations. **BOTH** books **FREE** with a year's subscription. Add 5c for postage

This is a very limited offer. It may be withdrawn at any time, due to the tremendous cost of paper, which IS JUST DOUBLE WHAT IT WAS ONE YEAR AGO. We have only a limited supply of these fine books on hand; after they are gone we cannot reprint the books until conditions become normal again. **Now is your chance.**

The publishers of this journal have earned an enviable reputation of giving more than 100 cents' worth for each dollar spent with them. Profit by this liberal opportunity NOW; it may never be made again.

HERE'S THE OFFER

Subscribe to the ELECTRICAL EXPERIMENTER for one year, at the regular subscription price of $2.00 per year (Canada, foreign and N. Y. C. $2.50) and we will send you either books shown in one of the above offers. If you subscribe for two years, two offers will be given, etc.

If you are a subscriber at present take advantage of this wonderful opportunity anyway. If you do, we will extend your present subscription.

This Offer Limited. *Act Now.*

The Rogers' Underground Aërial for Amateurs

(Continued from page 137)

specified, where the transmitting set is one employing an audion oscillation generator. The voltage in this case will not be extremely high, and special precautions need not be taken to provide extra heavy insulation on the buried antenna. Official tests by the U. S. Navy have shown transmission by radio over 50 miles with the Rogers underground antenna. *The wire in such a case, however, should be especially well insulated* to stand the higher voltage.

Regarding loop aërials in general, it would appear that we can expect a great deal from them, as some of the really remarkable results achieved during the war would seem to point out. The number of turns and the amount of wire to be used in a spiral antenna, such as shown at Figs. 7 and 8, will vary of course for different wave lengths, etc., and here is where the Radio Amateur will have a chance to carry out some original experiments, which may net him some real knowledge, fame and money. Another form of loop antenna, so-called, and which has been tried out several years ago with such success that European stations could be copied in a laboratory located in Florida, is one composing a square form, several feet in height. This was used, as just mentioned, to receive stations using fairly long wave lengths, say from 8,000 to 12,000 meters, W. L. Here the insulating form was wound with a layer comprising several hundred turns of insulated wire, such as ordinary annunciator wire. This antenna was successfully used in some tests made by the Marconi radio engineers at a laboratory in Florida several years ago. Trans-Atlantic radio reception was effected at the radio laboratory of Union College, Schenectady, N. Y., just prior to America's entrance into the world war. This aërial comprised about two dozen turns of No. 14 or 12 bare or R.C. wire, mounted on porcelain knob insulators screwed on the inside wall of the laboratory. The turns were spaced about 3 inches apart. The inside turn was 3 feet square. Flexible leads, fitted with clips, serve to connect as many turns as desired.

Choke Coils: Theory and Design

By Prof. F. E. Austin

(Continued from page 185)

side the coil, A denotes the cross-sectional area in square centimeters of the central hole thru the coil, and b denotes the length of the *coil* (not of the wire) in centimeters. For air the magnetic permeability μ is 1. For an iron core μ varies considerably, according to the kind of iron used. For ordinary iron μ will be between 1,500 and 2,000 which shows how L increases from an air core to an iron core value. Consult any text-book containing a magnetization table, which gives the various permeability values for different flux densities. The flux density in each case depends upon the ampere-turns produced by the coil; this value is found by multiplying the amperes by the number of turns in the coil. Thus it is seen how the value L constantly varies as the core is moved in and out of the coil, or the number of turns varied, as well as any variations of the amperage, which would change the flux and in turn the permeability. It is usual to allow 1,000 circular mils per ampere in designing choke coil or transformer windings; a common core flux density is 25,000 to 30,000 lines per square inch of cross-section.

Learn Public Speaking

10 LESSONS FREE

Write — quick — for particulars of this extraordinary offer; an opportunity you will never forget if you take advantage of it. Ten lessons in effective public speaking absolutely FREE to those who act promptly, to introduce our course in localities where it is not already known.

We teach you by mail to become a powerful and convincing speaker—to influence and dominate the decisions of one man or an audience of a thousand. We have trained hundreds and helped them to increase their earnings and their popularity. Learn, in your spare time at home, how to overcome "stage fright" and conquer fear of others; how to enlarge your vocabulary; how to develop self-confidence and the qualities of leadership; how to RULE others by the power of your speech alone; how to train your memory. Our

WHAT THE COURSE TEACHES YOU.

How to talk before your club or lodge;
How to address board meetings;
How to propose and respond to toasts;
How to make a political speech;
How to tell entertaining stories;
How to make after-dinner speeches;
How to converse interestingly;
How to write better letters;
How to sell more goods;
How to train your memory;
How to enlarge your vocabulary;
How to develop self-confidence;
How to acquire a winning personality;
How to strengthen your will power and ambition;
How to become a clear, accurate thinker;
How to develop your power of concentration;
How to be the master of any situation.

New Easy Method

perfected and taught only by Prof. R. E. Pattison Kline, former Dean of the Public Speaking Department of the Columbia College of Expression, can be learned in 15 minutes a day. GREATEST TOY SENSATION OF THE DAY!

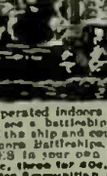
FIGHTING DREADNAUGHT

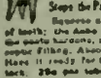
SENSATIONALLY REALISTIC!!!

Here is a model of Uncle Sam's fighting monsters. Eight big guns, each of which flashes, at correct intervals, from twelve to twenty times. Extra ammunition always obtainable. Absolutely harmless. Can be operated indoors or out. Non-boys! Here's your chance to own a battleship in action, and the best of it is you can OWN the ship and command the fleet yourself! By having two or more Battleships you can arrange EXCITING NAVAL BATTLES in your own home. Price a Warship and Ammunition, 15c, three for 40c, or a fleet of 3 ships for $1.00 postpaid. Extra Ammunition, 5 cents per box.



TOOTH-ACHE STOP

Stops the Pain; Stops the Tooth



Squeeze a little in hollow of tooth; the Amber Resin instantly fills the cavity, forming an air-tight filling. Absolutely harmless. Have it ready for the next toothache. 25c gas tube, postpaid.

Mysterious Ghost

This is not a pretty object, but there is no limit to the fun it will provide for practical jokers. The Ghost, when hanging in front of a window, darkened room, or dark place, glows with a ghastly cold bluish radiance, very apt to give one a creepy sensation. Even those who know what it is all about, it has a regular starting effect on. Makes the same quite a unique ornament only. A great joke to play on your mother-in-law. Price only 10 cents each, or three for 25 cents.

"SAFETY 1st" PINS

A clever novelty. The word "Safety First" is known the world over as a very popular slogan. Wear one and show your sympathy with the movement. Also handy for wearing at amateur theatricals and the like. Two sizes, No. 1, small gilt head and 1¼ inches long, plated 6c each, two for 10c, postpaid.

INKLESS PEN

WRITES with WATER 500 words every time dipped. Makes its own ink. Writes fashionable violet color. Better and cheaper than fountain pens. Writes a longer letter with one dip to plain water. No trouble—no bother—no mess. A splendid pen. Why bother with ink? Sample holder 10 CENTS, 5 for 25c.

SIMPLEX TYPEWRITER ONLY $2.50

Cheap But Good. So Simple a Child Can Use It. We Guarantee the Writing.

Though so marvelously simple this machine is a thoroughly practical typewriter. Its construction is so perfect that it is guaranteed to last for years. Has all the essentials of the high priced machine. It does not seem possible at the price, but all we need say is look at the work and you will be convinced. Each reasonable letter it will last a lifetime. It is so simple that almost any one can write with it. You can learn all there is to know about it in five minutes, and an hour's practice will make you an expert operator. Every letter looks exactly like the finest pen written, is indistinguishable from and creates the impression that the arm is a mechanical one, so strong and even is the impression. Is a Practical Exponent for all those who have occasion to do their own correspondence, whether it be for business or personal reasons, and to use it both. You should not miss the chance of owning a typewriter. The letters of the Simplex are 3 to 16, and particulars of the machine are so arranged that the letters most used are before the operator most of the time, enabling him to write rapidly. The universal bar, which carries the letters to the paper, is entirely under the control of the writer, moves the ribbon and the paper forward, giving the proper line space. So that the knack is acquired almost instantly, no decrease in the letter returns. Each typewriter packed in a strong box, with full printed instructions for use. Price each only $2.50, postpaid. Extra ribbons, 25c each.

Johnson Smith & Co., Dept. E 8, 3224 N. Halsted St., Chicago

SQUIRT RING

You may have a lot of fun with this Squirting Coin Safety Bank. It consists of a hard-rubber plated ring, attached to a rubber bulb, arranged that the latter is hidden out of view when the ring is in the proper position. Such a attractive looking article that the casual fellow will be sure to be the center of attraction. While the ring is being absorbed in so doing a fit our plan, you just squeeze the bulb and the water will squirt, etc., places a very great surprise. Price 10 CENTS, three for 25c, postpaid. A. G. CO.

Wonderful X-Ray Tube

A wonderful little instrument producing optical illusions both curious and startling. With it you can see what is apparently to be observed in the human body in a lived pencil, the interior opening in a pipe stem, and many other startling effects. A mystery that has long been able to defeat ordinary explain.

Price 10 cents. 3 for 25 cents; a dozen, 75 cents. Postage 2c each, postpaid.

Sneezing Powder

Place a very small amount of this powder on the back of your hand and blow it into the air, and everyone in the room or car will begin to sneeze without knowing the reason why. It is most amusing to hear their remarks, as they never suspect the real cause, but think they have caught it from each other. Between the laughing and sneezing you may be sure that the time will pass very fast. For parties, public meetings, car rides, or any place at all where there is a gathering of people, it is the greatest joke out. Price 12c a box; 3 for 30c.

By Express only

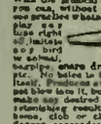
STAGE MONEY

With a dozen of these bills, it is easy for anyone to create the impression that he is a great prosperous. By flashing a roll of these bills at the proper time will be the cause of a genuine bill of two from the other. Between the laughing and counting you may be sure that the time of your life. For parties, public meetings, car rides, or any place at all where there is a gathering of people, it is the greatest joke out. Price 12c a box; 3 for 30c.

NEW BOOK ON ROPE SPLICING

USEFUL KNOTS, HITCHES, SPLICES, ETC.

Nine Different Knots Are Made and What They Are Used For. Hoists to Use and Hoists to Avoid.



A most practical handbook giving complete and simple directions for making all the most useful knots, hitches, rigging, splices, etc. Over 100 illustrations. All about waterproofs, lashing, blocks, tackles, etc. 37 Heraldic Knots Illustrated. Of great value to mechanics, riggers, campers, boatmen. Price 20c p. p.

Johnson Smith & Co., Dept. E8, CHICAGO

LUMINOUS PAINT

Make Your Watches, Clocks, Etc. Visible by Night The very latest discovery in the scientific world. Electric, non-explosive paint. We have at last succeeded in producing the remarkable LUMINOUS PAINT, which, applied to the surface of any article, emits rays of white light, rendering it perfectly visible in the dark. The Paint Will Last Almost Indefinitely. It Shines Night and Day. Anyone can do it. A little applied to the dial of your watch or clock will enable you to tell the time by night. You can coat the push buttons on switch plates of your electric lights, match boxes, and innumerable other articles, and make your own Luminous Creations. Sufficient to Bottle remaining materials, and articles, Price 20c, Larger sizes 50c and $1 per bottle. Johnson Smith & Co., Dept. E 8.

MUSICAL KAZOO

With the Musical Kazoo you can, without practice, play any one air whatsoever, also play any tune right off hand on any comb (not a comb) harp, guitar, piano, drum, Punch and Judy, etc. No holes to finger. It is simplicity itself. Produces a beautiful tone. You do not blow into it, but sing, speak, laugh or make any desired melody into the end of the instrument, and the most astonishing results of society entertainments, dance, serenade, parties, outings, etc., are yours. Just the thing for choruses and shows in lodge and church clubs, etc. Excellent for vocal or instrumental accompaniments, either with or without other musical instruments. Price 15c, p. p.

MAGIC FLUTE

Wonderfully Sweet Toned and Musical

A marvelous musical instrument. No other instrument produces exactly the same sweet tones as the human voice. It is the joyous notes of a quickstep or the soft and sweet strains of a church hymn—in fact, any class of music can be played upon the Bimaona tone without practice, as it is almost a self-playing instrument. When played with a piano accompaniment, or the other musical instrument, the effect is charming. Full printed instructions for playing sent with each instrument.

Price 15c, p. p.

Boys, you can have Movies at your own home with this latest model

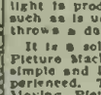
MOVING PICTURE MACHINE

Uses Standard Films same as the larger machines. Very easily managed. Simply turn the handle. Good Variety of Films always obtainable

PRICE Complete ONLY **$2.50** Postpaid anywhere Including Two Films

Extra Films, 45c each postpaid

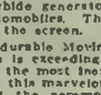
THIS IS A GENUINE MOVING PICTURE MACHINE and the motion pictures are clear, sharp and distinct. The Moving Picture Machine is finely constructed, and carefully put together by skilled workmen. It is made of Russian Metal, has a beautiful finish, and is operated by a finely constructed mechanism. The projecting lenses are carefully ground and adjusted, triple polished, standard double extra reflector, throwing a ray of light many feet, and enlarging the picture on the screen up to three or four feet in area. The light is produced by a safety carbide generator, such as is used on the largest automobiles. This throws a dazzling white light on the screen.



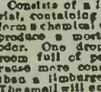
It is a solidly constructed and durable Moving Picture Machine. The mechanism is exceedingly simple and is readily operated by the most inexperienced. The pictures shown by this marvelous Moving Picture Machine are not the common, crude and lifeless Magic Lantern variety, but are life-like photographic reproductions of actual scenes, places, and people which never tire its audiences. This Moving Picture Machine has caused a rousing enthusiasm wherever it was used.

JOHNSON SMITH & CO.

Dept. E 8 3224 N. HALSTED ST., CHICAGO



ANARCHIST BOMBS



Consists of a little glass vial, containing in liquid form a chemical which will produce a most horrible odor. One dropped in a room full of people will cause more consternation than a limburger cheese. The smell will disappear in a short time. 3 Bonze for 25c, shipped by express only with a Dollar's worth of other merchandise.

ITCHING POWDER

This is another good practical joke: the intense discomfiture of your victims is everyone but themselves is thoroughly enjoyable. All that is necessary to start the ball rolling is to dissemble a little of the powder on a person's hand and the powder can be relied upon to do the rest. The result is a vigorous scratch, then some more scratch, and still some more. 5 Bonze for 25c, sent only by express. (Must order at least One Dollar's worth of other merchandise.)

INVISIBLE INK

The most confidential messages can be written with this ink, for the writing MAKES No MARK. Cannot be seen unless you know the secret. Invaluable for many reasons. Keep your postals and other private memorandums away from prying eyes. Great fun for playing practical jokes. Only 15c bottle.

LOVE LETTER INK

Writing written with this remarkable ink vanishes entirely in a few weeks (sooner if desired), leaving the paper QUITE BLANK. 15c p. pd.

LUMINOUS INK

Writing can be READ ONLY IN THE DARK. Quite invisible in daytime. 3 bottles for 25c, postpaid. Johnson Smith & Co.

MULTIPLYING BILLIARD BALLS

The Best Feat of its Kind

The trick is as effective as it is surprising. The performer rolls the balls around the ball for examination, and immediately it is returned to him has in each of his hands one of the balls, and the third finger and a second ball appears between. There are held in full view of the audience, the tips of the fingers of the left hand, and even while being placed in position, another ball appears between the tips of the fingers. Great is the mystification apparently suffers from some kind of spasm and yet another ball is the result. The feat can thus be repeated, the balls disappearing one after another in an almost endless manner. It is a very interesting trick that is quite easily performed by following the directions that accompany the apparatus. PRICE, 25 CENTS, POSTPAID. JOHNSON SMITH & CO.

GOOD LUCK RING

Gambler and Horse Dealer

A VERY STARTLING and mysterious ring, made of gunmetal, finished in oxidized design, with two brilliant flash or gems resembling fine cut diamond. A never failing object of interest. It is said by many to bring Good Luck, Health and Wealth, so will not guarantee that. It is certainly a very unique ring that you will take a pride in wearing. They were made to sell at 50 cents, but as a special bargain we will supply them to customers at one-half the price, at HALF PRICE, viz., ONLY 25 CENTS, POSTPAID. Johnson Smith & Co.

LOADED CIGARETTES

A box containing ten apparently genuine Cigarettes. They contain a tube which explodes when about one-third smoked.

They are real, and afford a good smoke, unless they are the cause of a great deal of fun. Price, 10c per box, postpaid. Johnson Smith & Co., Dept. E-8

THE "LITTLE GIANT" TYPEWRITER

A First Class Writing Machine For $1.25

A per act little typewriter for all that. There are thousands of persons who would like to own a typewriter but cannot afford the expense it other machines cost. To such persons we confidently recommend our Little Giant. It is strongly made, but simple in construction, so that any one can quickly learn to operate it, and write as rapidly as they would with pen and ink. The letters of the alphabet, numerals, and characters necessary to write a letter, are arranged in one to write rapidly. Use a postcard, 1 to 10, and the punctuation marks listed together. With this machine you can send your best wishes to your friends in less letters, address envelopes, make out bills, and do almost any kind of work not requiring a more expensive machine. With each typewriter we send a tube of ink and full printed instructions for using the machine. Price complete $1.25 by mail postpaid.

SERPENT'S EGGS

Each box contains 12 Eggs, which are no larger than a grain of oats. When lit with a match, however, each one grad-ually hatches itself into a Snake several feet long, which curls and twists about in a most lifelike manner. Price per box 10c, postpaid. Johnson Smith & Co.

MYSTIC SKELETON

A jointed figure of a skeleton 14 inches in height, will dance to music and perform various gymnastic feats when the operator may be any distance from it. The figure may be manipulated by the operator.

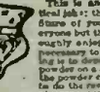
When handed back to the operator it is simply placed on a chair or table, when it will seemingly become endowed with life, and begin to dance. As the command of the operator it will sit down, stand up, dance, etc. We send full directions with each Skeleton, by the aid of which anyone can readily make it perform. 10c postpaid.

CIGARETTE ROLLER

Very neat and handy. Rolls less than a quarter of a second. It makes better cigarettes than you can buy and makes them easily and quickly. You can use just the tobacco you prefer and thus have a cigarette smoker's ready made. Sold more of them besides saving about half of your money. Just try one and make your cigarettes just to your own liking. Only 10c or 3 for 25c postpaid, with full instructions for use. JOHNSON SMITH & CO.

MIDGET ILLUSTRATED BIBLE

A Great Curiosity



The Smallest Bible in the World

The Midget Bible is a perfect gem, and a credit to art. It is about the size of a postage stamp, and contains TWO RUNG-RED AND FIFTY PAGES of the NEW TESTAMENT, clearly illustrated. The little Bible is a wonder. It is said to bring good luck to the owner. Must be seen to be appreciated. Price, only 12 cents. Three Bibles for 30 cents; one dozen Bibles for $1.00 or 100 for $6.00. Good money can be made selling these Midget Bibles among your friends, also churches, Sunday schools, bazaars, etc. Send for a few and try it.

The CONJURER'S CASKET

Apparatus and Directions for a Number of Mysterious Tricks Enough for an Entire Evening's Entertainment

ANYONE CAN DO THEM

50c

It is great fun mystifying your friends. Get this Conjurer's Casket, and you will be the life of your circle. It contains apparatus for seven first-rate tricks, including The Disappearing Handkerchief, where a handkerchief of your own, taken from right at your side, the Magic Vase and Ball Trick (a Wooden Ball is placed inside, and upon requesting the ball has disappeared and is found in someone else's pocket); The Magic Nail Trick (apparently cut your finger almost in two; the Wonderful Card Trick (a card is placed in an envelope and when opened an entirely different card altogether is found); The Disappearing Coin Box (a coin is placed in the little wooden barrel, and when opened again, is found to have vanished entirely, or can be made to change into a coin of another denomination); The Famous Mesmerized Penny that defies the law of gravitation (a penny balances on the head, nose, chest, wall, clothing, etc.); The Glass Goblet and Vanishing Coin Trick (a coin is dropped into a glass of water, and when the water is poured out the coin has vanished). With the seven tricks described above we send full printed instructions for performing each trick, so that anyone can readily perform all the tricks to the great amusement of the friends of the public. Any boy of ordinary intelligence with the Cabinet of Tricks in his possession can become a most expert magician. Besides the tricks contained in the Cabinet, there are twenty-five other tricks and illusions fully explained with full printed instructions, by which you can perform the most wonderful appearing feats. Among them are The Means in a Pack of Cards, The Dream Card, The Hat Trick, To Knock a Number Through a Table, One Cent Robbed into Two, To Find the Number Thought of, Mysterious Wedding Ring Trick, and the secret of performing three wonderful stage tricks, as follows: The Art of Cremating a Woman, Walking on the Ceiling of a Room, and the Disappearing Lady, together with an article of gentleman's and valuable hints to amateur conjurers. PRICE COMPLETE ONLY 50 CENTS.

JOHNSON SMITH & CO., Dept. E 8, 3224 N. Halsted Street, CHICAGO

The Newest Novelty Aerial Balloon

Now practically in or outdoors. This is the VERY LATEST SENSATION IN BALLOONS. A brightly colored balloon that measures sixteen inches long is blown up in the usual way and released, the air pressure sends the balloon SOARING UPWARD, the 3½-inch propeller SPINNING AROUND AT A LIVELY RATE. The effect is startling. It is a graceful affair that makes the passers-by WILD WITH JOY. May be used repeatedly indoors or outdoors. An immensely interesting toy. Price 10c each, 3 for 25c, postpaid.

JOHNSON SMITH & CO., Dept. E 8, 3224 N. Halsted Street, CHICAGO

"The Baby" Double Action Hammerless Revolver

A HANDSOME AND MOST EFFECTIVE WEAPON

$5.50

Measures but 4½ inches long

Takes regular .22 caliber cartridges

The new Baby Double Action Hammerless Revolver has been produced to meet the ever increasing demand for a revolver that would combine small size and light weight with the essential features of Efficiency and Practicability. It is small in size, yet in fact as effective and serviceable as the most expensive 38 that you can buy. Every one should have a revolver and should know how to use it, and there is no safer or better one made than the Arrest Action, with its safety action that guards against accidental discharge, making it quite safe for young men and ladies. The illustrations give an idea of its appearance, but it must be seen and used to be thoroughly appreciated. The construction and the handsome finish of the weapon from the cartridges can be shipped only by express. The purchaser three or a check to one number. The operation of the charging mechanism is extremely simple and absolutely reliable; it will not expend shells can be fired in so many seconds. The revolver is very well constructed, with finest nickel plated blued barrels of cylinder, and it weighs only 9½ ounces. The price at one dozen can be only $6.50, sent by express. JOHNSON SMITH & CO.

THE EXPO WATCH CAMERA

The most wonderful and ingenious Camera made

It is but little larger than a watch, which it closely resembles. You can carry the Expo about in your pocket and take pictures without any one being the wiser.

One Cent a Picture

The Expo loads in daylight with 25 Exposure Films, costing but One Cent per picture, including the developing. It is a compliment itself to operate. Takes pictures through the glass, where the Hand First Lens is located. The photos (6/8 1½) may be enlarged to any size.

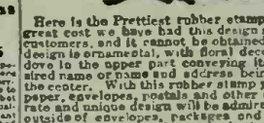
Price $2.50

QUICK AS A FLASH

Time and Instantaneous shutters; Graphic bar 8 speeds. Sight plated, Endorsed by amateurs and professionals the world over. Thoroughly practicable printing and developing of films just the same as ordinary cameras—is daily use by the public at our private apartments, detectives, and the professional. Hundreds of boats have been secured with the Watch Camera by enterprising reporters. Produces clear, sharp negatives indoors or outdoors equal to any camera on the market, at one-quarter the price.

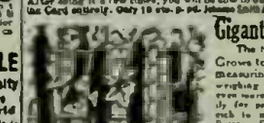
Expo Watch Camera Postage 10c Extra **$2.50** FILMS, 25 Exposures 15c, 25 Exposures, 25c Leather Pocket Carrying Case, 35c.

Johnson Smith & Co., Dept. E 8, 3224 N. Halsted St., Chicago



This Pretty RUBBER STAMP AND INK, 75c WITH PAD

Here is the Prettiest rubber stamp you ever saw. At very great cost we have had this design specially engraved for our customers, and it cannot be obtained except through us. The design is ornamental, with floral decorations, with a beautiful dove in the upper part conveying its message of love, the desired name or name and address being tastefully displayed in the center. With this rubber stamp you can brand your letter paper, envelopes, postals and other stationery, and the elaborate and unique design will be admired by all. Placed upon the outside of envelopes, packages and other mail matter, it ensures their return to the sender in the event of non-delivery for any reason. It looks very pretty stamped on books, music, photographs, etc. With each stamp we include a self-inking stamp pad and a bottle of ink for re-inking the pad, and the PRICE of the COMPLETE OUTFIT, in box, is ONLY 75 CENTS, POSTPAID.



New Vamping Card

No Teacher Needed Surprisingly Simple System

Persons having neglected their Musical Education need not despair, for with the aid of our new VAMPING CARD (about the size of a postage stamp) and a little practice you will be able to dispense with the use of the Vamp. The Card entirely. Only 10 cts. p. pd. Johnson Smith & Co., Dept E8

Gigantic Butter Beans

The New Edible Vegetable Wonder

Grows to an astonishing size, the Beans measuring from 3 to 6 feet long and weighing anything from 10 to 15 lbs. and even more. One Bean is sufficient for a family for several meals. Very palatable and much in nutritious materials. The Butter Beans is much appreciated. The Vines are rarely grown, very prolific, and a most welcome and valuable adjunct to your garden. Try them; you will find them the most delicious vegetable you have ever tasted. Imported direct. Unobtainable elsewhere. Sample package of Beans, with full directions for cultivating and cooking, 25c postpaid.

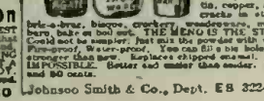
JOHNSON SMITH & CO. DEPT E8 3224 N. HALSTED STREET CHICAGO

SHARPEN-M-ALL SAFETY RAZOR STROPPER

SHARPENS EVERY KIND OF SAFETY RAZOR BLADE

Sharpens the Gillette and Durham Duplex both edges at one time

ALSO SHARPENS THE GEM, JUNIOR, ED-GE-READY, ASH-LATTER, MARS, CROSS, CLARK, AUTO-STROP STAR, CAL-STEEL, AND ALL OTHERS



By using the SHARPEN-M-ALL STROPPER, you will not only get BETTER SHAVES, but you will SAVE MONEY on blades, as you will be able to get from 150 to 250 shaves from one blade, and the last shave will be as good as the first. The construction is genuine and will last a lifetime. There is no guess work to operate it, and no order. Any amateur can use it just as well as the most expert barber. No experience necessary, as the arrow on the stropper shows the direction in which to move the blade. It has two separate surfaces, giving the CORRECT DIAGONAL STROKE. There are no moving parts to get out of order, and nothing necessary to operate the machine. The razors are made of a special hardened steel that STROP AND HONE at the same time. The razors run only one way, so there is no fear of damaging the blade or the stropper. The STROPPER IS ALL in one piece, and is handsomely nickel plated, with rubber bottom and felt underneath. The weight of the composite material is just right amount.

Price, only $1.00, postpaid.

JOHNSON SMITH & CO., DEPT E8 3224 N. HALSTED STREET CHICAGO

Potmend

Stops a leak in a minute

The finest repairer for Ironware, Agateware, Enamelware, etc. Good for kettles, pots, pans, boilers, and every kind of ironware. Also for tin, copper, aluminum, ice boxes, iron pipes, cracks in stoves, broken chairs, porcelain, brie-a-brac, bisque, crockery, wooden ware, marble, etc. Will not chip, rot, burn, bake or boil out. THE MEND IS THE STRONGEST SPOT IN THE POT. Could not be simpler. Just mix the powder with water. HARDENS LIKE IRON. Fire-proof, Water-proof. You can fill a big hole or a small crack. Mended part stronger than new. Replaces chipped enamel. Anyone can do it. FAILURE IS IMPOSSIBLE. Better and easier than solder. Three sizes, 10 cents, 25 cents and 50 cents.

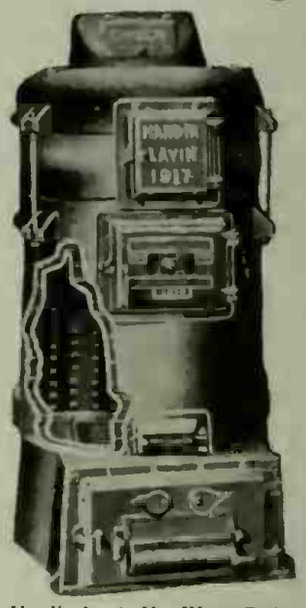
SAVE 1/2 - INSTALL YOUR OWN PLUMBING AND HEATING



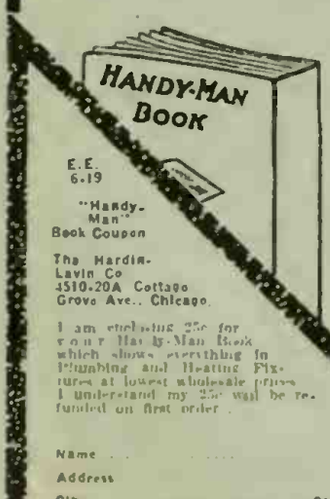
NEW HARDIN EASY WAY HARDIN-LAVIN CO CHICAGO

Reduce the High Cost of Building

Plan and Install Your Own Plumbing and Heating System

Our new HARDIN EASY WAY enables any electrician, carpenter, contractor, builder, or farmer to easily install a complete, highest-grade plumbing system. Forty years' experience selling plumbing and heating goods direct has qualified us to supply material equipped with patented, easily-adjustable connections that any handy man can install himself. Our method is perfect, simple and easy. It will enable you to save on time, labor and materials. It will reduce your installation expense ONE-HALF.

Hardin-Lavin Hot Water Boiler



Send for Handy-Man Book

This big, valuable, instructive book contains practical and exclusive information of value to every handy man. It explains the new HARDIN EASY WAY of installing; it tells you in advance what your plumbing and heating will cost; it gives you suggestions on what fixtures to select and how to install them.

This 256-page HANDY-MAN BOOK will help you save money, time, material and labor, because it will show you fully how to put in your own plumbing and heating by our new, modern and quick method. It contains a complete line of new designs in guaranteed plumbing and heating outfits with the latest improvements, water supply systems, sinks, pipes, valves, fittings, etc. Over 10,000 different fixtures and supplies are illustrated and described in this remarkable book. You can't afford to be without it.

No Expense Spared We have spared no effort and have gone to a great expense to compile this valuable book. With economy still a national necessity, it would be unpatriotic to send this expensive book broadcast to non-interested parties. Therefore, we request a temporary deposit for each copy of 25c which we refund on first order or we send our Bargain Bulletin Free. Send today, our easy method and prices will astonish you.

Let Us Help You Plan and Install Send us a sketch or plan of your plumbing and heating job. Our engineers will show you the easiest, cheapest and most practical way. We furnish clear and easily understood plans FREE. If necessary, we will loan you the tools.

CUT-TO-FIT METHOD

Even if you intend to employ a practical plumber, your big saving by using our products and "New Method" will surprise you. Our simplified systems are fitted at the factory for the exact job for which they are intended. Any handy man with a few ordinary tools can easily install our plumbing, water supply systems, pipeless furnaces, hot water or steam heating plant this cheap, easy way. No experience required. We even furnish the necessary tools if desired. Every fixture we ship is guaranteed to give satisfaction. We will replace without cost to you any part or parts that prove defective or unsatisfactory.

40 YEARS IN BUSINESS

at the same address. $500,000 plants behind our guarantee. Send the attached coupon now for FREE HANDY-MAN BOOK and full particulars.

Just what you need to know to succeed in ELECTRICITY

EVERY electrician, every engineer, every mechanic should know about these wonderfully helpful instructive books, which give in plain words a complete working knowledge of electrical engineering in all its phases.

You run into some new electrical problem almost every day. The information you need to help you in your every day work is in

HAWKINS ELECTRICAL GUIDES

These books place electricity at your finger ends. They cover every imaginable subject, principle, theory, problem, trouble, and way of doing things electrically. Every subject is indexed so that you can turn right to it. They are a study course and a reference guide in one, written in plain every day language—no wasted words—only what you need to know—chock full of up-to-the-minute electrical knowledge. The guides are a complete course in electrical engineering. They will help you in every detail of the day's electrical work. You can't ask an electrical question that Hawkins Guides can't answer.

What Electrical Men Say

Helped Him Make Good

"It is only right for me to recommend highly the Hawkins Guides, for they have been of the greatest assistance to me in placing me in my present position as Superintendent of Construction Department of one of Ohio's largest Electrical Companies. I would like to see every man have a set of Hawkins Guides."
Geo. Knecht, Columbus, Ohio.

In the Naval Electrical Dept.

"The Hawkins Guides are great help to me in the Naval Electrical Department, which they cover very thoroughly."
C. J. Cornell, U. S. Receiving Ship, Brooklyn, N. Y.

Superintendent

"I am now superintendent of the Dunnville Hydro-Electric Systems, and Hawkins Guides were a great help to me in holding down a responsible position."
W. E. Swartz, Dunnville, Ontario.

Wireless Operators

"I have worked wireless for ten years—but I wish I had these books years ago, as they have saved me a great deal of trouble." H. Marshall, Steamer M & B No. 2, Walkerville, Ont.

Pocket-Size Flexible Covers

The books are small enough to slip into your coat pocket—handsomely bound in flexible black covers.

You can carry each volume with you until you have mastered its contents. 3,500 pages of actual information and 4,700 illustrations. Once you see these books and put them into actual use you will never again want to be without them. Try it at our expense.

SEND NO MONEY

It will cost you nothing to receive these books—to look them over—ask them all the questions you can think of—use them in your work—study them—pick up some information that will increase your earning ability. We will ship you the entire set of 10 volumes entirely FREE.

This is a sign of our confidence in the guides. Pure gold does not object to being tested. Keep them for seven days and if you do not decide that you can't get along without them, return them to us and owe us nothing.

When you decide to keep them you only have to pay $1.00 down and remit the balance of $2.00 on the easy payment of $1.00 a month till paid for.

Use this coupon to get the books. It will pay you many times over.

READ THIS PARTIAL LIST OF CONTENTS

No. 1 Contains 348 pages, 388 illustrations. Electrical signs and symbols—static and current electricity—primary cells—conductors and insulators—resistance and conductivity—magnetism—induction coils—dynamo principles—classes of dynamos—armatures—windings—commutation—brushes, etc.

No. 2 Contains 348 pages, 394 illustrations. Motor principles—armature reaction—motor starting—calculations—brake horsepower—selection and installation of dynamo and motors galvanometers—standard cells—current measurement—resistance measurement—voltmeters—wattmeters—watt hour meters—operation of dynamos—operation of motors, etc.

No. 3 Contains 300 pages, 423 illustrations. Distribution systems—wires and wire calculating—inside, outside and underground wiring—sign flashers—lightning protection—rectifiers—storage battery systems, etc.

No. 4 Contains 270 pages, 379 illustrations. Alternating current principles—alternating current diagrams—the power factor—alternator principles—alternator construction—windings, etc.

No. 5 Contains 320 pages, 614 illustrations. A. C. Motors—synchronous and induction motor principles—A. C. commutator motors—induction motors, transformers; losses, construction, connections, tests—converters—rectifiers, etc.

No. 6 Contains 298 pages, 472 illustrations. Alternating current systems—switching devices—circuit breakers—relays—lightning protector apparatus—regulating devices—synchronous condensers—indicating devices—meters—power factor indicators—wave form measurement—switch boards, etc.

No. 7 Contains 316 pages, 379 illustrations. Alternating current, wiring power stations—turbines; management, selection, location, erection, testing, running, care and repair—telephones, etc.

No. 8 Contains 332 pages, 436 illustrations. Telegraph—simultaneous telegraphy and telephony—wireless—electric bells—electric lighting—photometry, etc.

No. 9 Contains 322 pages, 627 illustrations. Electric railways—electric locomotives—car lighting—trolley car operation—miscellaneous applications—motion pictures—gas engine ignition—automobile self-starters and lighting systems, electric vehicles, etc.

No. 10 Contains 513 pages, 589 illustrations. Elevators—cranes—pumps—air compressors—electric heating—electric welding—soldering and brazing—industrial electrolysis—electro plating—electro-therapeutic—X-rays, etc.

Also a complete 126-page ready reference index of the complete library. This index has been planned to render easily accessible all the vast information contained in the 10 electrical guides. There are over 13,500 cross references. You find what you want to know instantly.

Unparalleled Opportunities in the New Field of *Electro-Technics!*

Announcing a New Specialized Course of Electrical Instruction to Train Men for This Newest and Biggest Field in the Electrical Profession

FOR years there has been developing in the industrial life of this country a wide commercial gap between the skilled, technically-trained Electrical Engineer and the "apprentice-trained" Electrician. At the top of the electrical profession has stood the Engineer—at the bottom, the Electrician. And in between has grown up a tremendous field of high-salaried industrial positions calling for *technically-trained electricians*—the field of Electro-technics! Thousands of leading industrial concerns today are looking for men who can fill these higher-grade electrical positions—men who can qualify as Power Plant Superintendents, City Technicians, Electrical Draftsmen, Testing Room Foremen, Supervisors of Maintenance of Electrical Motive Equipment, etc.—*Electro-technicians!*

You boys who are interested in an Electrical career—you men in the electrical trade who are handicapped by lack of technical training—*here is your big opportunity!*

Become An Electro-technician—Thousands of Liberal-Salaried Positions Opening Up All Over the Country in This Big, Uncrowded Field

Now is the time to start your training—with a tremendous nation-wide industrial reawakening right at hand—*with the most stupendous skilled-job market in history awaiting you when you graduate!* Already the first signs of the new industrial era are on the horizon. Rise to this world-epoch opportunity. Follow the example of the thousands of men of all ages in all walks of life, who at the close of the Civil War *revolutionized their entire life-careers in the great commercial readjustment that followed the War of the Rebellion.*

Mailing This Coupon Today May Prove the Turning Point of Your Life!

SEND ME THIS BOOK

I am interested in the big success-opportunities offered in the new field of Electro-technics. Send me a copy of Booklet-Catalog "*The Electro-technician — A New Factor In Modern Industry.*"

It is of course understood that this request places me under no obligation.

If Tel... about your "Earn While You Learn" Plan

The Only School in the Country That Offers This Specialized Electro-technician Course

Nowhere else can you at present secure this valuable, specially-arranged, condensed course of Electro-technical training—training that is thoroughly sound and practical from start to finish—training that combines work-shop, laboratory, drafting-room and recitation-room instruction in equal measure and in efficient daily sequence.

Entrance Requirements

The course is open to all applicants who have at least a common grammar school education or its equivalent. All completed High School work in studies essential to engineering, such as Mathematics, Physics, Chemistry, etc., will be credited to student on entering. Such students will be given advanced standing that will enable them to complete the course in *one-half to three-fourths the regular time*, according to the number of credits they have on entering.

Next Term Opens July 1st
Classes Forming Now

Quick action is necessary as the number of students that can be accommodated in this term is limited. So don't delay. Look at your calendar—note the date—clip the coupon at the left—and some day you'll be looking back to this day and congratulating yourself over and over again for taking the first step in the greatest field Electricity has ever offered!

ELECTRICITY-L·L·COOKE-SUCCESS
I TEACH ELECTRICITY. LET ME MAKE YOU A SUCCESS

Be a Certificated Electrician!

Electricity is to-day lighting and moving the world. It is calling for experts in this business and offers you a bigger success than any other profession. Go after some real money. Qualify for one of the thousands of splendid positions open. All you need to start is a few months' snappy, *practical* instruction from a competent engineer. Come with me—*NOW*. I'll give my personal care to ensure rapid and efficient progress. My course is intensely practical. It is highly condensed, simplified, up-to-date and complete.

SATISFACTION GUARANTEED

I am so sure you will make a splendid success in this study, that I will *Guarantee Under Bond* to return to you every cent paid for tuition, if you are not entirely satisfied when you receive your Electrician's Certificate granted you as a graduate of my school.

Prepare yourself for a real position by my *Home Study Course* in *Practical* Electricity. I am Chief Engineer of the Chicago Engineering Works. I have trained thousands of men and can help you better than anybody else. We also have large, splendidly equipped shops where you can come at any time for special instruction without charge. No other correspondence school can give you this.

FREE—LESSONS AND OUTFIT

Send me the Free Outfit Coupon at once.
Do it *now!* For a limited period I am making a slashing cut in the cost of tuition, and giving each new student a grand outfit of Electrical Tools, Material and Instruments—in addition—*Absolutely Free*. I will also send you—free and fully prepaid—Proof Lessons to show you how easily you can be trained at home to enter this great profession, by means of my new, revised and original system of mail instruction.

WRITE NOW—DON'T DELAY

Delay never got you anything. Action is what counts. Get started—and get started now. Write for my big new book—"How to Become an Electrical Expert."

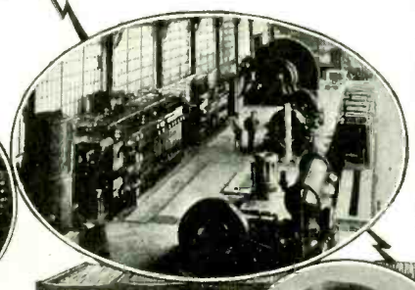
Learn ELECTRICITY as in practice

Electricity as experts know it—

RIGHT before you there is pictured a compact set of books which contains all the information you require to advance to the highest positions in the world of electricity. No instruction, no consultation by correspondence is necessary. The entire subject is before you, clearly written and clearly illustrated.



Whether you have spent years with electricity, or are a mere beginner, CROFT'S LIBRARY OF PRACTICAL ELECTRICITY will enable you to master modern practice, and fit you quickly for one of the thousands of responsible positions now open to those who are properly trained in electricity.
